Many kinds of seed are threshed with modifications of the ordinary threshing machine, usually with some teeth left out of the concave. A threshing machine, however, delivers a curious mixture of good and worthless seed and of sticks, dirt and refuse. A trip through a seed warehouse is rather thrilling when one examines the ingenious devices which are used to make

People have little realization of the vast numbers of crosses that must be studied to find a single good vegetable variety. This is Dr. T. W. Whittaker at El Centro, California, where thousands of plants and hundreds of strains of lettuce are under test. Dr. Whittaker is successor to Dr. I. C. Jagger, a New Yorker who won world fame as a lettuce breeder.

seed to the West Coast for reproduction. In looking for places, three groups of factors have to be considered. The first is good yield of seed with fair assurance of a crop every year. Competition keeps this requirement in the foreground for if a good seed yield per acre is not achieved, business will go to someone else who can grow it more cheaply. The second requirement is that conditions in the growing sections shall give good germination and good curing. No matter how much is known about real values in seed, a great deal of buying is done on the appearance of the sample. The third requirement is that it must be possible to produce seed that is free of disease infection that will trouble the planter.

Seed Geography

Areas of seed production are constantly shifting. Colorado grows seed of the vine crops, of beans and onions. Idaho is heavy in peas. The Puget Sound section of Washington produces the bulk of our American grown cabbage seed and also quantities of beets and spinach. California offers favorable conditions for a wide variety of vegetable seed: celery, lettuce, carrots, onions, beets, beans and many others. Much seed of tomatoes and peppers is also grown.

Middle Western and Eastern states also have important seed industries. Michigan is a center for beans and radishes and also for tomatoes. New Jersey is important in tomatoes. Sweet corn seed comes largely from Ohio, Illinois, Iowa, Wisconsin and New York.

Few realize the difficult and peculiar problems that are involved in growing a market crop of seed. Cabbage or po-

American Agriculturist, April 13, 1940

American Agriculturist, April 13, 1940

the necessary separations. Elaborate mills that have grown up from the old fashioned farm fanning mill are in use, employing sieves and air blasts for the purpose. Near each machine is an enormous battery of screens not only of different sizes but with openings of different shapes, and the foreman must know just which of these screens to use with a given sample to get the best results. Then, there are most ingenious devices which make use of shape and of the specific gravity principle to get out the small and undeveloped seeds which are usually light. Also, it is not

desirable to have oversized seed in a sample because it interferes with evenness of planting when it goes through seed drills of various sorts. With some seeds, flotation is used to separate good and bad.

The vine seeds are usually put through crushers and grinders. Then, seed and fine pulp is screened from the shells. Some are fermented and some are not. Also, some seeds have to be taken out by hand or spoons. Tomato seed is usually obtained by crushing and fermenting. The good and bad seed are separated and the fine refuse taken

out in a flowing stream of water.

Throughout all these processes, the utmost care must be exercised to be sure that various lots of seed do not get mixed. Labels must be written without mistake and workers must be absolutely positive in seeing that the proper label gets to the proper bag. Imagine the fun that would ensue if a cabbage label was fastened to a bag of kale seed. Most seedsmen use two labels—one inside the bag and one tied with the bag-string. Some go a bit further than this and sew the outside label to the side of the bag avoiding

the possibility of misplacing the label when the bag is untied.

Seed is not particularly perishable but one of the great hazards in the North in most sections is that of insects of various sorts; so, most warehouses have fumigation chambers and they have a whole armory of fumigating materials for specific purposes. Also, when warm humid climates are involved, special rooms are now in use where the atmosphere can be kept dry and sometimes they are actually refrigerated.

All of this says nothing about the business ability that is necessary to make a success of the thing, of the salesmanship that is required to get the goods to the user and of the endless precautions that must be observed all along the line to avoid errors and to meet the special needs of special trade and various growing districts.

For the Seed Buyer

Now, come back to the thing that we take very much for granted. The first requirement, if one is to have satisfaction in the buying and planting of seed, is to know something about seed. Of course, the planter—particularly, the home gardener—cannot get into the technical side of the thing but he should know what ought fairly to be expected from seed by way of viability, freedom from disease, and truthness to type. With that knowledge, then, he ought to expect delivery of good seed. Seedsmen are like other people—most of them deliver goods up to the standard which their trade insists upon having and which they are willing to pay for. The intense competition in the seed business makes it hard for the house that is trying to do things well. A man may wave his arms in meeting and shout about how willing he is to pay for good seed if he could only lay his hands on it. Then, when the seeds salesman comes around, he is likely to place his order on the basis of a 10% difference in price. Of course, if one is going to pay the higher price, he needs full assurance that he is getting value for the extra investment but trial usually furnishes the answer to that question.

People are inclined to blame seedsmen for too many failures. Possibly, disappointment is due to soil or weather conditions. Possibly, if the wrong thing came up, the hired man might have taken the seed out of the wrong bag.

On the other hand, many give the seedsmen the benefit of the doubt, blaming the failure on the unknowns of climate or soil, or upon one's own possible mismanagement when really the seed is not what it ought to be. It is at this point that a reasonable knowledge is necessary. One may then insist with assurance on the thing that should rightfully be his and may avoid injustice to the seedsmen because he does not understand the situation.

Cornell Extension Bulletin No. 426 "Varieties of Vegetables for 1940" is in the hands of most County Agents and may be had, by residents of the state, upon application to the College of Agriculture. To residents of other states, it is available at a charge of 3 cents per copy. Another bulletin, not new, is Cornell Extension Bulletin 122 "Better Seeds for Commercial Vegetable Growers". The suggestions offered in this publication will not be of any harm to home gardeners who are a bit interested.

Dangerous to Use Brakes After Blowout

In case a tire bursts do not apply the brakes or throw out the clutch until the car slows up, as this may cause a skid or loss of control. Quick braking after a rear tire blowout at high speed may cause the car to turn over.

SUPPOSE a plow could talk. Here's what it would tell you about tractors:

"After you've been plowing through seven inches of sticky gumbo for a couple of days you get a pretty good idea of what's important in a tractor and what isn't. You learn that no matter how big and powerful a tractor looks, or how much noise it makes, it's the pull on the drawbar that counts.

"That's why these modern high compression tractors are tops with me.

"Guess I'll never forget the first time I was hitched up to one. I knew something was up when they set me to plow seven inches deep instead of my usual five. It sure looked like we were in for some tough, three-mile-an-hour, second-gear plowing. Imagine my surprise when the high compression tractor hauled me across the farm in high gear at better than four miles an hour.

"We finished the job in just five hours less than our usual time and later I heard my owner say he'd used less fuel than ever before. After that, nothing these high compression tractors do surprises me very much.

"Time and again I've seen what looked to be a two-plow tractor walk away with three plows. I've seen them cut hours and days off drilling and planting time... harrow 40 acres in two hours... cut oil costs as much as 60 per cent."

That's a plow's-eye view of high compression. No matter how you look at it, there's every reason to be sure your next tractor has high compression.

Because they use the same good gasoline you use in your car and truck, high compression tractors warm up easier, idle better, use less oil than old-fashioned machines and eliminate the nuisance of radiator curtain adjustments. Modern high compression tractors have so much power that frequent gear shifting can be avoided.

For the full story of why high compression tractors bring you better power farming, talk to neighbors who own them, or better still, talk it over with your tractor dealer and arrange for a demonstration. Ethyl Gasoline Corporation, Chrysler Building, New York, N. Y., manufacturer of anti-knock fluids used by oil companies to improve gasoline.

TUNE IN EVERY MONDAY NIGHT—Tony Martin, Andre Kostelanetz and his orchestra, featured on "Tune-Up Time" over coast-to-coast network, Columbia Broadcasting System.

GET MORE HORSEPOWER AT LESS COST THROUGH HIGH COMPRESSION

Let's take a plow's eye-view OF A MODERN HIGH COMPRESSION TRACTOR...

HIGH COMPRESSION HERE

MEANS MORE POWER HERE

CHANGE-OVER FOR EXTRA POWER AND BETTER ECONOMY. Nearly all old-fashioned tractor engines can be easily changed to high compression engines by the installation of high compression or "altitude" pistons or a high compression cylinder head, "cold" spark plugs and by setting the manifold to the "cold" position. Do this when you recondition your tractor this spring and take advantage of this extra power.

30% MORE HORSEPOWER. The above chart shows the increase in horsepower obtained by using high compression and a good grade of regular gasoline in a number of recent tractor tests. Farm tractor manufacturers as well as tractor owners have been quick to recognize the fact that more power gives more productive power farming.

BIG SAVING IN TIME. Smart farming means taking advantage of today's sunshine today. And a tractor that can pull three plows instead of two, or pull two plows faster in a higher gear, work more acres per day, idle without stalling, and eliminate radiator curtain adjustment, will earn its "keep" many times over.

BIG SAVINGS IN OIL. It is generally recognized that tractor engines, when using good gasoline, require fewer oil changes than when using low grade fuels. That's because the use of good gasoline eliminates wasteful crankcase dilution. This saving on oil consumption runs as high as 60%.

THE SWING IS TO HIGH COMPRESSION. Only a few years ago high compression tractors made their first commercial appearance. Today practically all tractor models offered by the leading manufacturers of farm tractors have high compression engines as either standard or optional equipment.

DOWN THE

By J. F. (DOC.) ROBERTS

EVEN IF YOU look and feel younger
with your hat on, as I do, there are
times when the problems facing us
just seem too great ever to be over-
come. When a sheep feels this way, it
just dies; if a horse does, we turn him
out to grass; and a bull just gets ugly.

With us humans the remedy is youth,
intimate association with young peo-
ple. I have just spent two full days
with college students. They are well
aware of conditions, eager to talk
about them in groups or singly, and
here are just a few of the things they
asked me:

"Why is a lot of land that will pro-
duce good grass in the Northeast not
being used?"

"What would happen if the govern-
ment put a good woven wire fence
around a lot of such land it owns, let
us say in hundred acre plots, and rent-
ed it out for grazing purposes?"

"Would this return a revenue above
cost and help our tax situation?"

"Is grass silage, then, at least part
of the answer toward winter feed?"

"Why isn't more corn grown and
corn silage made in the Northeast?"

"Is artificial insemination going to
make it possible, economically, for
every farmer to improve his live-
stock?"

"Is the refrigerated locker the means
not only of improving and cheapening
the farmer's food costs, but also the
city family's; and if so, is it possible
that this may materially change our
marketing and distribution systems?"

"If the automobile industry, with all
its ramifications, was practically built
up in your lifetime and is now employ-
ing millions of men, isn't it possible
that something can be built up in our
lifetime?"

"If our grandfathers and great-
grandfathers built the Northeast with
diversified farming and the range coun-
try has now lost its advantage, cannot
we rebuild it by the same diversifica-
tion methods?"

"Are not our own farm organiza-
tions, like the Farm Bureau and
Grange, working in conjunction with
our successful cooperatives, better able
to handle our farm problems than the
National Government or other political
organizations?"

Maybe this sort of thinking has re-
newed your spirit and confidence, too.
Anyway I am sure if you could have
seen the eyes of these young people
flash and their cheeks flush as they
talked, full of energy and high serious-
ness, it would have. Try this "youth
movement." It's good for what ails
you and me.

STEWART SHEARMASTER

DOES A QUICK, SLICK JOB

Get 10% more wool from same sheep or goats with the fast, easy-to-use Shearmaster. Powerful ball-bearing, fan-cooled motor inside the special EASY-GRIP handle—diameter barely 2 inches. Designed for farm flock shearing. New professional type tension control. Removes fleece from sheep in a few minutes. No second cuts. Longer fibre wool grades better—brings more money. Saves time—work. Pays for itself quickly in extra wool secured. Shearmaster, complete with 2 combs and 4 cutters, only \$22.95 at your dealer's or send us \$2.00—Pay balance on arrival. Slightly higher west of Denver. Write for new Stewart bulletin, "Harvesting the Farm Flock Wool Crop," and FREE catalog of Stewart electric and hand-power Clipping and Shearing machines. Made and guaranteed by Chicago Flexible Shaft Co., 5664 Roosevelt Road, Chicago, Ill. 51 Years Making Quality Products.

Dr. Naylor's MEDICATED Teat Dilators

Safe and dependable treatment for
Spider Teat, Scab Teats, Cut and
Bruised Teats, Obstructions.

Dr. Naylor Dilators are sterilized, medi-
cated and saturated with the antiseptic
ointment in which they are packed.
They have a deep yielding surface of
soft absorbent texture which fits either
large or small teats without overstretch-
ing or tearing and which carries the
medication INTO teat canal to seat of
trouble.

The Only Soft Surface Dilators

Easy to
Insert—
Stay in
the Teat

Whether infection at end of teat, cut or
bruised, the resulting condition which
closes teat canal making it hard to milk is
always the same—INFLAMMATION.

To relieve inflammation in a wound or bruise the
treatment most universally used by the veterinary
and medical profession is—to apply antiseptics, heal-
ing agents and a sterilized, soft absorbent dressing.
Dr. Naylor's Medicated Teat Dilators apply this
same treatment for removing inflammation from the
milk canal of cows' teats. They carry antiseptics and
healing agents into teat canal to combat infection
and promote healing.
The dilators them-
selves are sterilized,
soft, absorbent dress-
ings which protect the
inflamed area, absorb
inflammatory exu-
dates and keep teat
canal open in its nat-
ural shape while
tissues heal.

Sterilized, Medicated—
Packed in Antiseptic Ointment
Large Pkg. (48 Dilators) \$1.00
Trial Pkg. (18 Dilators) .50

CHECK BOG SPAVIN PROMPTLY to Help Prevent Permanent Injury

To check bog spavin you must
catch it at first signs of puffi-
ness, before the hock bunch
hardens.

When first noticed, rub
Absorbine on the puffy hock
to stimulate local circulation,
to increase the blood flow, which in turn re-
duces the swelling. Then apply an Absorbine
poultice for 3 hours. Repeat the treatment
twice daily until the swelling goes down.

Absorbine is not a "cure all," but it is most
helpful if you use it as recommended. That's
why many experienced horsemen and veteri-
naries use Absorbine to help check windgall,
curbs, thoroughpin, and similar congestive
troubles, to help prevent them from becoming
permanent, painful, incurable afflictions. \$2.50
the long-lasting bottle at all druggists.

Use Feeds that Produce RESULTS

● There is only one reason for using milk products in feeds—that reason is *Results*. Poultry mashes and calf feeds produce better and more economical results when they contain milk than if they lack its important nutrients.

Results are measured by faster growth and greater gain per pound of feed consumed—greater productivity with lower feed cost per pound of meat or dozen of eggs produced. That is the kind of results every farmer wants. It is the kind of results obtained when dry skim milk is used in good rations, as proven repeatedly in research and commercial experience.

Look for dry skim milk in the list of “guaranteed ingredients” of the feed you buy. Always use it for *Results*. There is no substitute for milk.

AMERICAN DRY MILK INSTITUTE, INC.

NEW TYPE LITTER Absorbs 3½ Times Own Weight in Water!

LIGHT... AIRY... ALMOST DUSTLESS... HELPS TO KEEP CHICKS WARM AND DRY

Stazdry rapidly absorbs water—up to 3½ times its own weight. It never cakes down hard. Thus it evaporates moisture faster... provides a drier, fluffier litter. Lighter in color than most litters, Stazdry keeps brooder houses brighter. Made from crushed and shredded vegetable fibres, it mixes readily with droppings and provides a good fertilizer.

Tests at the New Jersey Agricultural Experiment Station showed Stazdry leading other commonly used litters in 10 out of 13 desirable qualities.

Sold in 100-lb. bales that are easy to handle, occupy small space, and cover a large floor area. You'll find it economical to use. Order from your local feed dealer.

MORE HENS on a Dairy Farm

SOME years ago Leon Smith of Little York, Cortland County, New York, decided that it would be desirable to increase the size of his farm business. He felt that his dairy was about as large as possible on the acreage he had available. The growing of cash crops did not seem feasible without cutting down the size of his dairy, so he began to consider the keeping of more hens.

As long ago as 1926 he had a flock of 150. By 1935 the flock had increased to 400, and last summer he built an addition to the poultry house so that he could keep 1,000 layers. The house has two stories and is equipped with a ventilation system as recommended by the State College of Agriculture. At the time it was remodeled, it was well insulated, a point which Mr. Smith

Mr. Smith holds a conference in the chicken house.

feels is quite important. The house was built entirely with labor on the farm. It is probable that in a year or two another poultry house will be built.

“Do you hatch your own chicks?” I asked Mr. Smith.

“I never have”, he replied. “This year I bought my chicks March 12, and when they came it was 4° below zero. However, I have lost very few of them up to date. I never figure it is wise to shop around for the cheapest chicks I can get. I am willing to pay a good price, but naturally take every precaution to be sure that I am getting what I pay for.”

My next inquiry concerned feeding methods and management.

“My first job in the morning,” replied Mr. Smith, “is to do the barn chores. Then when I come to the chicken house, I scatter two quarts of clipped oats per 100 hens in the litter. Then at night I feed them all of the wheat and whole corn, mixed half and half, that they will clean up. If I find much grain in the litter when I come in in the morning, I cut down on the amount. They have dry mash in front of them all of the time, and sometimes during the winter when I feel they

Mr. Smith's poultry house, showing the new addition put on the front last summer.

NEVER AGAIN WILL I TRY TO RAISE CHICKS WITHOUT PROPER MEDICATION

Thousands of Poultry Raisers Say:

It pays to put Dr. Salsbury's Phen-O-Sal Tablets in the chicks' drinking water—right from the start!

Give your chicks this extra care. Phen-O-Sal is a double-duty medicine*. A balanced blend of antiseptic and astringent drugs. Always uniform in quality. Dissolves quickly.

Demand genuine Dr. Salsbury's Phen-O-Sal Tablets for your chicks. See your Dr. Salsbury dealer, who may be a hatcheryman, druggist, feed or produce dealer.

DR. SALSBUURY'S LABORATORIES
Charles City, Iowa

*DOUBLE-DUTY MEDICINE
Dr. Salsbury's Phen-O-Sal acts TWO ways: (1) checks germ growth in drinking water; (2) medicates chicks' digestive system.

Dr. Salsbury's
PHEN-O-SAL
TABLETS

BABY CHICKS double their birth weight in 10 or 11 days. To make this rapid growth, they need adequate Vitamins A & D. “Nopco XX” Fortified Cod Liver Oil provides an easy, economical way to supply both vitamins in accurate, measured amounts.

“Nopco XX” fed regularly at recommended levels is flock protection against possible Vitamin A & D deficiency. No waste—no dangerous variation—GUARANTEED to contain 3000 U.S.P. units of Vitamin A and 400 A.O.A.C. units of Vitamin D per gram.

Don't take chances. Make sure your chicks get their full quota of Vitamins A & D by feeding “Nopco XX” daily. High in potency, it goes farther than ordinary oil and saves you money.

Thousands of mill-mixed mashes contain “Nopco XX”—identified in many by the familiar Red Top guarantee tag. Also available from dealers in handy 2 and 5 lb. cans.

*“Nopco XX” is a registered trademark of National Oil Products Company

need to consume a little more feed, I sprinkle a little water on the mash in the hoppers to provide them with a little wet mash.

"I have the drinking fountains equipped with heaters, but, because the house is so well insulated, it has been unnecessary to use them very much. As you will see, there is running water

The pulley on this motor is covered first with sponge rubber and then with sandpaper. It makes a good egg cleaning outfit.

right here at every fountain, with a container under the fountain to catch all of the drip. This is a great help in keeping litter dry. In the winter, I turn on the lights early in the morning."

From the poultry house we went to the cellar under the house, where Mr. Smith packs his eggs. He gathers them at least three times a day and takes them directly to the cellar, which is unusually cool and damp, so the eggs deteriorate very slowly. Here they are packed and shipped twice a week by truck to New York City.

Pointing to a small electric motor, Mr. Smith said:

"This is a little jigger that I fixed up for cleaning eggs." Run by the motor is a pulley, covered first with sponge rubber and then with a piece of fine sandpaper.

"Let's have a demonstration", I suggested.

The switch was turned on, and Mr. Smith proceeded to clean a few eggs. There is no patent on the idea, so maybe you will want to try it out.

This poultry sideline can be duplicated on hundreds of Northeastern farms. First, there was the need for an additional source of income. Hens seemed the logical answer, and through the buying of good chicks and following good every-day methods of management and feeding, they filled the bill.

—H. L. Cosline.

Your Questions Answered !

Weight of Baby Chicks

How much should baby chicks weigh?

The usual standard for chicks entered in baby chick shows is 2 lbs. for each 25 chicks. Naturally one of the advantages of good-sized chicks is that they are hatched from big eggs and the chances are better that the pullets will lay big eggs.

Breeding for Egg Quality

Is egg quality something that can be improved through breeding?

Egg quality is made up of a number of things. It has been found that size and shape of egg and color of shell are inherited, and therefore that these characteristics can be improved by breeding. However, size is not related to shape, and each one of these qualities must be bred for separately. Experiments show that shell quality and the yolk can be influenced by feed-

SUMMER SHELTER FOR POULTRY

a profit maker that costs little AND IS EASY TO BUILD

Out of the 216 designs of the 4-Square Farm Building Service, we feature the Summer Shelter for Poultry. Here is a piece of equipment that makes profits. It's an aid to safer roosting. It protects poultry from hot summer sun and predatory animals. It can be covered with canvas to provide shelter until cold weather. It is movable and promotes sanitation by enabling poultry to be raised on clean ground. The summer shelter proves that Better Farm Buildings increase Farm Profits. Blue Prints and Material Lists and ready-to-use 4-Square lumber for building this shelter are available at your 4-Square Dealer. See him today. See his complete 4-Square Farm Building Service which includes various types and sizes of farm buildings. Whether your specialty is dairying, poultry, hogs, beef cattle or crops you'll find a kind and type of building to meet your needs.

(Continued from Page 21)
ing, but that the condition of the albumen is mainly a question of breeding and handling the eggs properly after they are produced.

Vitamin A

What are the symptoms of vitamin A deficiency in growing chickens?

One of the most characteristic symptoms is a swelling of the eyes and the sticking together of eyelids. The chickens do not gain weight, and they stumble around when they walk. Apparently the best way to be sure that the chick ration is well supplied with vitamins is to use a ration supplied by a feed company of undoubted standing. New information about vitamins has taken some of the hazards out of poultry keeping. This is particularly true where chicks are raised in confinement, which under certain conditions is important in controlling disease.

Egg Weight Loss

Under good conditions, how much weight will eggs lose during incubation?

One hundred average sized eggs should lose about ten ounces a week. Weighing eggs is one way to find whether the humidity percentage in the incubator is correct. If the eggs lose more than ten ounces per hundred eggs, the conclusion is that the air is too dry. An experienced operator can judge fairly accurately by candling the eggs and noting the size of the air cell at different stages of incubation.

Drinking Water Disinfectant

Is it advisable to use a disinfectant in the drinking water in a poultry house?

The idea has some advantages, particularly if any of the flock have colds. The common disinfectant used is one carrying chlorine. This can be purchased from a number of houses that handle poultry equipment. The use of a chlorine disinfectant in drinking water is not a cure-all, but does tend to slow up the spread of disease from bird to bird.

Eggs Per Hen

How many eggs will a hen have to lay before she begins to show a profit?

Naturally costs vary, but roughly it takes 100 eggs per hen to pay all of the legitimate charges, including interest on your investment; so in order to stay in business and prosper, you will need an average production as much better than 100 eggs per hen as you can get.

Cooling Eggs

Are wire baskets important as an aid to cooling eggs rapidly?

Experiments have shown that eggs in wire baskets will cool approximately twice as rapidly as they will in galvanized pails. A good many poultrymen increase rapidity of cooling still more by removing the eggs as soon as they are gathered to an egg room supplied with moisture and turn an elec-

tric fan on the eggs for an hour. Sometimes a damp bag is put between the fan and the eggs to increase humidity.

How Do You Clean and Pack Eggs?

Cleaning and packing eggs is a real chore on poultry farms or on general farms where poultry is an important enterprise. Many farmers have discovered egg cleaning and packing shortcuts to save time and effort and still get better results.

We are firm believers in the value of lessons learned through experience, so we are offering \$1.00 each for all letters of 300 words or less which we are able to print on the subject "How I Clean and Pack Eggs."

Send your letters to Poultry Department, American Agriculturist, P. O. Box 367, Ithaca, New York, with the heading "How I Clean Eggs."

Look for Your Name

If you haven't played our "Hidden Name Game", start with this issue. Concealed in our columns are names and addresses of several subscribers, picked at random from our subscription list. Yours may be among them this time. IT IS WORTH \$1.00 TO YOU IF YOU FIND IT AND SEND IT TO US BY APRIL 20.

As several subscribers seem to have misunderstood the rules of the game, we want to make it clear that this game does NOT include your stencilled mail address and name on first page. Also, there is no reward for finding names of persons other than YOURSELF, or for picking out letters from an advertisement and putting them together to make your name. THIS GAME APPLIES ONLY TO NAMES AND ADDRESSES WHICH STAND ALONE and have no connection with either advertising or editorial matter. If you are one of the lucky ones this time, you will find your name and address, plainly printed, standing by itself on some page other than page 1.

The purpose of this contest is to encourage more careful reading of the good things in our editorial and advertising columns, and also to provide some fun and profit for our readers. If you find your name, simply drop a postcard to American Agriculturist, Box 367, Ithaca, N. Y., before April 20.

Incidentally, the following subscribers lost \$1.00 each by not finding their names in our March 16th issue: Harry I. Ledden, Glassboro, N. J.; James H. Hines, Hicksville, N. Y.; Samuel J. Sturdevant, Fulton, N. Y.; H. M. Dundow, Brandon, Vt.; Frank B. Rogers, New Boston, N. H.; Upton Grosnickle, Myersville, Md.

"Let's eat, drink and be merry, for tomorrow we may fry."

WENE EXTRA-PROFIT CHICKS

ELMER H. WENE

DRASTIC PRICE REDUCTIONS ON CHICKS OF SUPER-QUALITY!

Year by year, WENE quality advances steadily, impelled by our rigid Breeder-Selection Program, reinforced by double testing. Yet giant-scale production, 6,000,000 in 1939, makes possible sensational price slashes, especially on Super and Super-X Matings.

Wonderful Success Raising Baby Chicks

Mrs. Rhodes' letter will no doubt be of utmost interest to poultry raisers who have had serious losses raising baby chicks. Read her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks so thought I would tell my experience. My chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Company, Waterloo, Iowa, for a 50c box of Walko Tablets. They're just the only thing to keep the chicks free from disease. I raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."
—Mrs. Ethel Rhodes, Shenandoah, Iowa.

Danger of Infection Among Baby Chicks

Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Use preventive methods. Give Walko Tablets in all drinking water from the time chicks are out of the shell and you won't lose one where you have lost dozens before.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

WALKER REMEDY COMPANY
Dept. 406, Waterloo, Iowa

Hall's Chicks

Leghorns-Reds-Rocks-Wyandottes
New Hampshire-Hallcross (Crossbred) Chicks
All chicks produced from flocks tested for Pullorum Disease (B.W.D.) by the Official State testing agency of one of the six New England States, with **NO REACTORS FOUND** Tube Agglutination tested within the preceding calendar year.

CHRISTIE'S New Hampshires Bred for Full of SPIZZERINKTUM

CHRISTIE Prices Scaled Down
Customer Profits Stepped Up
Vastly increased equipment and production have made possible the sharp reductions in SPIZZERINKTUM Prices, to lower Customers' Chick costs and boost their profits. Plan your whole 1940 Program now, on Chicks or Hatching Eggs from SPIZZERINKTUM New Hampshire or CHRIS-CROSS Barred Hybrids—35,000 Breeders, Pullorum Passed; No Reactors. Book your Orders for Spring deliveries, and avoid delays and disappointments. Write Today for New Illustrated Catalog and Prices.
ANDREW CHRISTIE, Box 55, Kingston, N. H.

MAPES CHICKS

Sturdy, fast growing, large egg chicks from Mapes bloodtested breeders. All breeding males are R.O.P. pedigreed. White Leghorns, New Hampshire and Barred Rocks from healthy Mapes Certified breeders. Red-Rock pullets—All-round production birds. Red-Rock cockerels are excellent and profitable broiler birds. Send for folder and prices today.
WILLIAM S. MAPES, Box A, MIDDLETOWN, N. Y.

BARRON LEGHORN CHICKS

from high record trapped, bloodtested stock; Imported and bred this strain for 25 years. Sexed or Unsexed chicks. Free circular.
DAVID M. HAMMOND, Rt. 3, Cortland, N. Y.

BABY AND STARTED CHICKS—Blood Tested and U. S. Approved flocks. Hatches each Wednesday throughout year. Leading Commercial Breeds. Registered Cocker Spaniels. Circular and prices.
KENYON POULTRY FARM, MARCELLUS, N. Y.

"QUAKER STATE

*adds profits
to farming"*

THAT'S the record experience of John L. Johnston, farmer, truckman and custom plowman of Chariton, Lucas County, Iowa. He has two trucks, a tractor-operated threshing rig, and a heavy-duty tractor. He has shaped his work schedule to spend part of his time doing truck work on the county roads, and several weeks each year at tractor-plowing and grain-threshing for farm neighbors.

"To operate trucks and tractors at a profit, the first thing you have got to consider is overhead and repair costs. What you can save on these items is

apt to be your real profit.

"In my work, I know positively that Quaker State saves ten times its price in repair bills. I do most of my own repair work and; therefore, I can prove that Quaker State saves rings, rods and tightening work. What is still more important, it insures me against expensive breakdown on rush jobs."

Aside from repair saving, worth many times the initial cost of the product, Mr. Johnston believes that "Quaker State gives from 25% to 40% extra lubrication value." Quaker State Oil Refining Corporation, Oil City, Pa.

WE LEFT THE FARM ... —and Lost a Home

How often farmers and their wives, grown old on the farm, and worrying about the hard work and short finances, have sold out, only to regret it bitterly all the rest of their lives. Right out of the heart and life of a farm woman comes the true story printed on this page.—The Editors.

IT HAS been twelve years since we locked the side door of the empty living room on the farm. Empty after the farm sale except for a few pieces to be taken by an antique dealer. Fertilizer, seed and machinery bills were paid; mortgages adjusted; and we had an equity in a city property for which we had exchanged the farm.

I had stored with a neighbor my drop-leaf mahogany table that had been half of my grandmother's dining-room table from Loudoun County, Virginia; also, the long mahogany sofa, and the old cherry, hooded cradle in which four little boys had slept and two little girls had rocked their dolls. That is all that is left of a home that is calling me, calling me to come back.

Today, in a furnished room on the East side of New York, in a dingy old brown stone house that may once have been a home of refinement and hospitality, I look out my rear window at a dust covered alanthus tree, clothes-lines and window boxes filled with food. On the street in front, children run in and out of traffic and play on dirty sidewalks. Boys crowd in vestibules and play cards and craps.

To me, the memory of the beauty of summer and winter, the comfort and abundance, the simple realities of farm living are crying aloud. Disappointing and uncertain as farming may be as big business, it affords security and independence. It is the place for homes. And there is one less home in the world because we abandoned ours. We, who had weathered so many storms, went seeking fair weather and easy living at just the time we should have stayed safe in port.

* * *

The two-hundred-and-fifty acre farm which we bought thirty-five years ago, was run down and forlorn when we discovered it, the buildings neglected, the house one hundred years old with no improvements. But we were young and not afraid of work.

Because I was a city woman who had never lived on a farm, my neighbors looked for my reactions. They were curious about what I would say and how I would take it. I learned to make sausage and scrapple, to put away hams and bacon and lard for the winter, to corn and dry beef. I made soap, dried vegetables, canned and preserved fruits. I whitewashed and painted and papered walls and ceilings. I raised chickens and children at the same time, which is hard to do. And my garden grew to be a common ground of understanding with the women of the neighborhood, who at first were critical of me. Some years later I was selected as the representative farm woman of my state.

There was no cellar under the kitchen and the first winter I frosted my feet, and my dish towels hung frozen in the kitchen all day. I gave the children baths in wooden tubs until we had a bathroom. We had the bathroom before we had a car, which wasn't the usual procedure in the neighborhood.

Definite high points stand out in my memory. When we snapped on the lights, and they worked, from the electric plant installed by my husband and the boys. When we opened the corner fireplace that had been plastered up for years and found the hooks for a crane. When the old iron sink and hand pump in the darkest corner of the kitchen

gave place to the big white enamel one with a long window above it, where I could look out at the rolling stretches of the farm as I worked. And when I got the three burner oil stove that the children saved for and gave me on a Mother's day.

It was a very happy home.

Each year for twenty-five years the farm grew more fertile, the house more comfortable, the sod deeper, the trees bigger, my roses and my garden more beautiful. That is the way a homestead grows.

But the children grew up also, and went away. We did not discourage them from going. It was we who ought to have stayed. We did not think of the grandchildren who might want to find us there. We had three successive bad years. Farm labor was motoring to the city to work for high union wages. Taxes were high with small benefit to the farmer. My husband had worked in vain for three years to get an appropriation to cinder the old dirt road past the farm, which in the spring hauling season was hub deep in mud. Poles and Hungarians began buying up neighboring farms. Few of them were citizens. Almost all of them ran stills. We decided to follow the example of the other American farmers in the neighborhood. We sold out . . . and shut the door.

But we can't shut the door on the memories of a house where four sons were born. Where two daughters were married. One in June among roses and lilies and late iris. The other in December with snow on the ground and on the pine trees. Deeply glowing fires in living-room and parlor. Groundpine and holly everywhere. "Such perfect weddings," they said, when they kissed us good-by.

Through a mist of tears, I look back on those twenty-five years on the farm and know them to have been good.

Happy they certainly were for the children. Forty acres of woodland. Five running streams. A creek with a swimming hole. The boys up at dawn on gunning day to spot rabbits in the hedgerows before the gunning party came. Stealing out with lanterns before daylight to look at traps. Horseback to High school four miles away. Watermelon parties and fights and exciting vigils at night to catch watermelon thieves. The annual fishing party to the shore after harvest. And as they grew older, there were house-parties and visits, for we managed to give each child a year away from home at Prep school or college.

Economically, I have no memory of "hard times" on the farm until after the war. We would have good years and bad years. Nights of peace and nights when we worried. One year, a

"Eddie never has forgot the time that big fish pulled him in the river."

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Rain in Spring

Down the pane on silver toes,
A joyful, dancing raindrop goes.

Upon the roof a million more
Have improvised a dancing floor.

And everywhere they trip and sing,
The while they work at making Spring!

—Alice Crowell Hoffman,
York, Pa.

mysterious blight, about which even the state experiment station had no data, wiped out our melons. Another year the crop was so huge and the melons so fine that people came from miles around to buy them.

One year we sent to Rochester for a new variety of cantaloupe that had never been grown in our neighborhood. It was very large, very attractive in appearance, with extremely deep yellow texture and delicious flavor. In the market they had to call in the police to keep the crowd of buyers in order. We had two acres of them and grossed four hundred dollars an acre. Next year we planted ten acres of the same variety, only to discover that neighboring farmers had bought the melons for seed and planted the same strain, with the result that the ten acres yielded a net profit less than the two acres the year before.

For three successive years we made big hits raising bantam corn when it was still a novelty. We increased our acreage from forty acres to a hundred. We bought carloads of young pigs to eat the nubbins and sold the hogs, when grown, at an average of fourteen cents a pound live weight. The third year we took a trip to California.

A later year we planted a hundred acres of sugar corn, and a five-inch rain in three hours, that broke all records for a hundred years wiped out seventy per cent of the crop.

One year we had a most marvelous crop of potatoes. Two hundred bushels to the acre, my husband estimated, and we had thirty acres of them. We would walk over the fields in the evening and dig up a hill here and there and talk of what it was going to mean to us. Improvements to the house, or more years at college for the children. Perhaps a trip south in the winter. The price per sack of two and a half bushels was ten dollars in July. It would have been shrewd if we had dug them half grown and sold them then. But a real farmer is too creative to be shrewd. He must watch his crop mature as a mother watches her child. When the potatoes were ready to be dug in August, the price had dropped to seventy cents a bushel and by Christmas they were a dollar a sack. Right weather conditions and a big crop over the whole country, and they were coming in by shiploads from Belgium and Holland without tariff. This was about the year 1920.

Yes, farming is a gamble. And so is life.

The economic conditions on the farm during and after the world war were abnormal. We had had four years of expansion as a direct result of the call to farmers to produce to the limit, and after the war to meet the demands of devastated Europe. Farmers yielded to

the hysteria of Wall Street and of industry, and were buying more farms, operating them with tractors and on borrowed money, experiencing the excitement and rivalry of "big business". Farmers in our section who had been comfortably off on one hundred or two hundred acre farms, with diversified crops and small orchards and producing feed and fertilizer for animals and crops, were now operating six hundred to a thousand acres or setting out twenty-five thousand fruit trees a year, and buying all their feed and fertilizer.

And they met exactly the same disaster as did the Wall Street brokers.

* * *

When we left the farm, we took a two-room apartment in New York, my husband and I. In twelve years we have moved twelve times, as bugs or smells or noise have driven us out. The apartment had a dinette and a kitchenette. I abhor those names now as I abhor luncheonettes and cafeterias and dableds. I smiled when I remembered my old rule on the farm, "Only six boys in the kitchen at once". For we had kept open house in the summer for city relatives and I had a soft heart for small boy cousins.

Deep down in my sub-consciousness I had a brooding fear of the city's cruelty and aloofness. But I would not let myself be daunted. Within a week my husband had a job in his old profession, and I was taking a course in the city college to teach English to foreigners. That was in 1928.

A year later, following the depression, we had lost the property for which we had exchanged the farm. Work in the city for people over fifty was getting increasingly difficult to obtain and to hold. Had we stayed on the farm, no matter how hard the times were, there would have been food and warmth and shelter; spacious and dignified living; a home for the children to come to if they were ill or discouraged. Harder work and longer hours, yes. Fewer luxuries and some hardships. But never again shall I fear work as much as I have feared, and watched others fear, having no work to do.

We took a larger apartment and I rented rooms. It paid our rent and we had space for a "dabled" when any of the children came home. They called it home wherever we were. I wasn't smiling now when I remembered the old attic that we had fixed over for house-parties when we enlarged the house. It had big casement windows at each end and room for five beds.

Renting rooms, in its turn, grew harder, as with increased unemployment, families doubled up and rent received grew less. In my desire to "Keep my end up", I tried many kinds of work. Addressing envelopes, selling magazine subscriptions, promotion work for laundries, and preparing foreign-born for citizenship. I answered many advertisements, I even inserted one: "Do you need the services of a grandmother in your home?" I felt that I was being wasted as a grandmother, with four little grandchildren far away and no grandparents' home to visit. But I only received one answer, offering a home without salary.

In this huge city I am a spectator and not a participant. There is no renewal of inspiration or vitality. Breathing coal dust has dulled my alertness. Traveling underground has made me forget there are stars to look up to. My roots have been pulled up from the good earth and will not take "a-holt" in city streets.

* * *

The children stood by, as they always had, with loyalty and devotion. We would have been happily welcomed in each home. But we clung to our independence. We could not be reconciled to the reversal of the conditions of the past, when parents gave helping hands to their children when they started out in life to found new homes. It was

handing the torch backward instead of lighting the way ahead.

* * *

I long to "belong" some place again. I am acquiring the city habit of looking at people without seeing them, averting my eyes in the subway. Maintaining a mental detachment from human bodies crowded against mine. On the farm, the "Mrs." was always being called upon. I miss neighbors and friends who shared old memories and jokes, joys and sorrows. So many people have been happy in our home, and now I realize that a home has ever-widening circles of influence. And that the basic reason for this long and heart-rending depression may be that so many homes, both in city and country, have been abandoned. For it is the essence and

core of America that her people find, maintain and defend their own homes.

Today, our old farm is owned by a syndicate. It is operated commercially. It is no longer a home-place. Profitably operated, probably, with subsidies and compensations. Political influence has brought a wide state road to the end of the lane. There is small chance of the farm ever coming back to us.

When I close my eyes, the cordwood stick burns in the fireplace again. Tall candles are lit in the deep window ledges. Dear voices call, "Hi-Mom! . . . Grandmother! . . . Grandfather!" An arm is across my shoulder . . . "Gee, but it's good to be home again." And I dream that Grandfather and Grandmother are where grandparents belong, "Down on the farm."

See the 1940 PERFECTION OIL RANGES ... before you buy any range!

A Perfection gives you so many time-and-worry-saving conveniences that you'll be more and more pleased every time you use it! All operations are handy at the front. The High-Power Burners give clean, fast, easily-regulated heat that *stays set*—no fading or flaring.

The famous "Live Heat" oven makes baking better than ever—and the removable oven burner set can be used with a portable frame as an *extra stove*! You save on fuel, too. For Perfection burns kerosene, the modern economy fuel, at amazingly low cost.

MODERNIZE Your Living Room

By MRS. GRACE
WATKINS HUCKETT

At the New York State Fair last year, Cattaraugus County Home Bureau's exhibit (pictured above) was a living room before and after being improved at small cost. Although part of the picture is obscured by the railing in the foreground, it is easy to see the great difference made by the clever, inexpensive changes described on this page. Total cost of the improvement was less than \$25.00.

A LONG with Spring and housecleaning rites usually comes the urge to make some needed changes in the house, particularly in the living-room. Somehow all the green freshness and newness of the outdoors call for a corresponding show of life and vigor indoors. "If I had the money," said a friend of mine to me the other day, "I would throw out all of this shabby old furniture and get something new. I'm awfully sick of it."

Well, anyone can modernize her home if she has plenty of money, but it can also be done at little or no cost. That money isn't the big essential is proved by the interesting picture on this page, showing Cattaraugus County (N. Y.) Home Bureau's state fair exhibit of a living-room "before and after" being improved. Here are the details of what was done:

The old chair in room 1 (to the left) was badly worn, hence was torn down to the frame and completely reupholstered. The cover on davenport was badly worn but springs and padding were still good, so a slip cover was made for it. A sectional glass-doored bookcase stuck back in the corner was brought into the center of things, had its glass doors removed, and was painted to match the woodwork in the room. Useful books, clock and flowers were put in it instead of its former useless bric-a-brac and photographs.

A stiff-legged radio, out of everybody's reach, had its legs sawed off to bring it down to convenient table height. Then when placed at the end of the davenport with father's pipe and paper on top of it, he could sit or lie comfortably and still turn the dials. The ordinary lace curtains pulled tightly together in the first room were replaced by colorful striped curtains hung properly and pulled back to reveal the beauties of the outdoors. The table was refinished and lamps were remodeled. Details of cost were:

9 yds. (at 69c per yd.) of sunfast, tubfast, twilled cretonne to cover davenport.

Chair, copied from one costing \$69.50, cost about \$10 to remake.

5 yds. (at 79c a yd.) of dustite window fabric curtaining was split, making cost per window about \$2.00.

Do's in Room Arrangement

When you tackle your own living-room, here are some "Do's and Don'ts" that will help you:

1—Try to imagine yourself a stranger seeing your living room for the first time.

2—Draw the large furniture into the center of the

room and take out all small pieces in order to make room as bare as possible.

3—Plan an arrangement which you think will look well.

4—Consider family activities which normally occur in the living room. Then group the furniture by units for reading, for music, either piano or radio, for conversation, for children's activities, or for games or work.

5—Give the room a sense of balance by distributing large pieces; having them all on one side or end would make that part of room heavy in feeling. Use enough smaller light pieces to add variety and interest as well as usefulness.

6—Maintain proportion by grouping heavy or light pieces together respectively; for instance, a large overstuffed chair with a large sturdy table; a tall floor lamp beside a tall rather than low piece of furniture.

7—Try each piece in more than one place and at different angles.

8—Have a light background with enough warmth to offset the many dark days of this climate.

9—Use enough bright colors to lend interest and accent. Repeat the accent color in order to tie the whole scheme together. Pillows, vases, flowers, footstools, magazine covers, bookbindings, wall hanging, and scatter rugs can be utilized for this purpose.

10—Place pieces used while reading or working where they get good daylight; also provide abundant artificial light beside them at night.

11—Consider views seen through windows when placing chairs and davenport.

Don'ts

1—Don't clutter—better store many small objects and use them when wanted to carry out a color scheme, or when needed.

2—Don't be monotonous by having too many things in a room which are alike in color, size or kind.

3—Don't have too many pieces the same height—if you already have such pieces, break the horizontal lines with pictures, books, bouquets and lamps.

4—Don't make the room look stiff and unfriendly by having all groups exactly centered in a wall-space, or by keeping piano, desk and book case closed, or by having an unused look about the room.

5—Don't overdo the dull blues, browns, grays or taupes. They lend a cold, dull look.

6—Don't have too many patterned surfaces in walls, drapes, rugs and upholstery. Have some plain or indistinct all-over patterns which are not obtrusive.

7—Don't place large pieces or rugs cater-cornered. They look better parallel to walls, and make the room look bigger.

8—Don't place furniture in center of room unless room is very large.

9—Don't feel guilty if you store in the attic some of the stuff you took out. Most living rooms are overcrowded.

10—And don't be discouraged if Dad and the family razz you. They will enjoy and appreciate the result of your efforts.

More Music for Rural Churches

MORE AND BETTER music for rural churches of our land is possible in every county where there is the will to work on a cooperative music program. If rural choir leaders and public school music teachers will join together to promote actively such a program, truly amazing results may be achieved.

In Tompkins County, New York, for example, the past twelve years has seen a remarkable development of musical activities in the county under the leadership of the county council of churches. A big factor in this has been the consolidated rural schools, which have brought more musical leadership into the county and have organized children's glee clubs, orchestras, bands, and dramatic clubs.

Two music festivals are now held annually by the county, one for the public school singers and instrument players, another for the rural choirs and dramatics groups. The rural choirs' festival is planned by an active committee of the county council of churches. For several weeks previous to it, each choir rehearses separately the numbers they are to sing; also, the massed choirs practice some numbers together, led by a local director. Given with the program of music is a religious drama or pageant.

Rural choirs are encouraged to purchase inexpensive collections of music, such as the Twice 55 Book. "Something old and something new" has been the basis of selection of numbers for the festival program, keeping them within the abilities of rural choir members but also giving them the opportunity to attempt new and increasingly difficult music.

As a result of these annual festivals, rural choirs in Tompkins County have increased the quantity and improved the quality of music for their churches. Children, our "singers of tomorrow", are made use of as choir singers wherever possible, and encouraged to join together as groups in cooperative programs. For further information on how to organize and improve the church music in your county, address Hugh F. Williams, Pres., Tompkins County Council of Churches, Ithaca, N. Y.

One Church for Four

(Continued from Page 1)

petty local wrangles held up progress, but these were frankly faced and finally overcome by plain common sense and the application of the Christian spirit. Finally the desired result was accomplished by mutual concessions and patient determination.

Our Church membership is now 130, with about the same number in the Sunday School. The recent record for attendance was 132.

The latest organization is a Sunday School Class for young married people, college students, teachers in our centralized school, and other young people. This group fills the gaps for those between 18 and 40—a gap which is so painfully evident in many Churches. This organization, called the Triple-M Class (Misters, Misses and Misses), promises to be one of the most valuable groups in the Church.

The entire set-up is an outstanding example of the infinite superiority of one well organized and active Church in a farming community as compared to four or five pitifully small sectarian groups, all starving to death and each blaming its troubles on the others.

Compared with the pitiful and unpardonable situation found today in many rural communities, it is, to cite Dante, as "Paradise to Purgatory." I choose Purgatory rather than the Inferno because Purgatory does claim to offer a chance for improvement. I have seen some communities that deliberately prefer the sectarian Inferno type. Compared to that sort of thing, McLean is "A little heaven below."

The chief problem of a federated Church is the cultivation and handling of missionary and other benevolent interests which are so largely administered by denominational agencies. We are earnestly seeking an adequate so-

lution to that problem. Otherwise, the McLean Federated Church is by far the most interesting and stimulating rural Church its pastor has ever known.

The influence of its Federated Church is not confined to the little town of McLean. About ten years ago, a large community men's supper was held there. The idea spread to neighboring villages, and four years ago what is called the "Seven Town Men's Brotherhood" was organized. It meets regularly four times a year in different towns, bringing together men of all sects and no sects, for feasting, fellowship, entertainment, instruction and inspiration. Fine programs are given, with competent speakers presenting topics of vital interest. Its first meeting was held in McLean, and it is steadily growing in influence.

Anyone desiring more information on the McLean Federated Church system is invited to correspond with the writer.

Use SPRING'S Charming Colors

PRINTS lend variety to one's wardrobe; this year their tiny motifs of color on color, and the monotonies—different shades of the same color—are outstanding. The pastels, heralded as summer colors, belong to spring also. The rose tones are flattering to most people, while the soft tones of aqua and muted greens with an olive cast add great interest.

FROCK PATTERN No. 2859 is ideal for the larger woman because every line is designed to flatter. Sizes are 36 to 50. Size 36 requires 3½ yards of 39-inch material, ¾ yard of 39-inch contrasting.

DRESS AND JACKET ENSEMBLE No. 3143 is the maiden's answer to her prayer for a charming, youthful outfit. Make skirt and jacket of sheer wool or silk, the blouse of candy stripe woolen challis or spun rayon. It gives the effect of a suit but really is a one-piece dress and extra jacket. Pattern sizes are 12 to 20. Size 16 requires 3½ yards of 39-inch material for skirt and bolero; 1½ yards 39-inch contrasting for bodice.

TURBANS No. 2567 and No. 3082, which can be made of matching materials, come in one size adaptable to any headsize and must be ordered separately.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Spring fashion catalog.

BOY-WHAT A WINTER! I'M STILL SHIVERING

Banish Chilly Rooms FOREVER

with a

UTICA HEATING SYSTEM

And Don't Pay a Penny Until Fall*

1 Jim struggled all winter to keep our house warm and comfortable but with the severe weather our old heater just couldn't do the job in spite of the extra coal we burned—and our fuel bills were terrific!

***2** We talked to an Authorized Utica Dealer and we learned that we could replace our worn-out heater with a Utica Radiator Heating System for as low as \$10 a month, and we need make no down payment, and no payment until Fall!

3 Now we have comfortable, radiant heat in every room . . . and best of all—Jim doesn't have to spend hours trying to keep the fire roaring hot even on the coldest days. We've banished cold, drafty rooms and the cost was surprisingly low.

Guarantee Bond

All Utica Products are Guaranteed—your protection for reliable heating comfort.

Utica Boilers are economical and efficient.

**NO DOWN PAYMENT
AS LOW AS
\$10 A MONTH**

A CRAWLER TRACTOR

DELIVERED AT YOUR FARM

FOR

\$965

CLETRAC MODEL HG

20 H. P. on Belt 2-3 Plow Power on Draw Bar

42 in. Tread, 6 in. Track .. \$965.00

68 in. Tread, 6 in. Track .. \$985.00

42 in. Tread, 10 in. Track .. \$995.00

Here is a tractor that asks no favors. You can plow under adverse conditions. You can plant, cultivate and harvest on time. You can run a mill or feed grinder; you can saw wood; you can pull stumps; you can dig ditches and do other miscellaneous work — whenever you want.

IT PLOWS—2-3 plow capacity for any soil.

IT PLANTS—Accurate steering, positive traction mean straight, uniform rows.

IT CULTIVATES—With "full view" mounted cultivator for all row crop cultivation.

IT MOWS—"Full view" mower has cutter bar ahead of tractor.

The General "Full View"

The New Low-priced rubber tired wheel tractor that does ALL farm work. Delivered on your farm \$650.

1-2 PLOW, 2-row planting, 2-4 row cultivating

The General "Full View" tractor is the wheel tractor that thousands of farmers have sought—a 1-2 plow tractor that plants two rows; cultivates two, four or six rows; that mows a six foot swath; runs the average sprayer or duster; saws wood and does hauling. It is a general purpose tractor of the best construction and at a price to fit your pocket book. The General meets the demands of "one team" farmers yet will handle large acreage as well—and do both jobs efficiently.

TRY the "Cletrac" or the "General" on Your own farm —under your own conditions.

Cletrac Crawlers
for better work at lower cost

from Skeff's Notebook

A SELF-STUDY of the apple industry that promises far-reaching results was begun in Rochester with organization of the Joint Fruit Committee of the State Farm Bureau Federation and the Horticultural Society.

Earl W. Merrill of Webster, a former county agricultural agent, was elected chairman and Dr. G. W. Hedlund of the Cornell economics department was elected secretary. The committee spent the first day of its sessions in informal discussion of various problems and agreed that one of the first matters needing solution was obtaining uniformity in sizes of apple boxes. "Other problems will be tackled as soon as they present themselves," Mr. Merrill said, emphasizing that the committee had no preconceived notions, that it did not expect to solve anything by mere "resolving", and that a long, hard task was being laid out for the committeemen.

Members of the committee include: Horticultural Society—John A. Hall, Lockport; George LaMont, Albion; George A. Morse, Williamson; Bruce P. Jones, Hall, and Merrill.

Farm Bureau Federation — Jean Butts, Cato; Frank W. Beneway, Ontario; George Collamer, Hilton; Fred J. Nesbitt, Albion, and William J. Hall, Lockport.

Invited to the first meeting and asked to work with the committee were Harry H. Duncan, State Department of Agriculture and Markets; Prof. M. B. Hoffman, Cornell pomologist; Richard Fricke, assistant county agent leader; Herbert King, federation president; Roy P. McPherson, Horticultural Society, secretary; Carl Wooster, State Soil Conservation Committee.

The box problem was put at the head of the list because for several years it has resulted in growing confusion. It is claimed that some so-called "standard" containers will not load in railroad cars or trucks; that the number, size and shape constantly becomes more confusing.

Odd Boxes Make Trouble

Several growers reported to the committee that after they had sold apples already packed in one type of box they found they had to repack them in other boxes to comply with buyers' ideas. The extra cost and extra handling were condemned.

Fundamentally, the box presents another problem which was aired before the committee. It will be recalled that a practice was to pack the bushel basket with a "bulge" on top. Receivers claimed this was essential to provide against shrinkage. In due course the bulge was accepted as part of the bushel, and was especially important to retailers who resold by the pound or specimen.

When the box came in it was decided it should contain the equivalent of bulged bushel, but that it should be packed without a bulge. This at first meant the box contained a bushel and one-eighth. Next it was demanded that boxes be filled to the top of the ends, rather than the sides. Result: One and one-fifths bushels. More recently there has been demand that the box be bulged. Result: A very "out-size" bushel for which the grower receives only bushel price. Many growers find it necessary to pack the out-size in order to make sales, but there is much dissatisfaction and a growing desire for uniformity of measure as well as shape in the boxes.

Precedent in Committee

The committee is patterned after a similar joint committee set up by the two state organizations in 1929. Previ-

ously, in 1926, a Western New York Farm Bureau conference had set up a fruit survey committee. It made numerous recommendations and asked to be discharged in 1929. The industry received its report so favorably that it asked the two state organizations to continue the work. The same committee was named a joint body by the organizations, under the chairmanship of Harry Wellman.

It proceeded to draft a program that time proved to be sound. It was discharged after two years, when the county Farm Bureaus undertook to put its recommendations into effect. Sentiment has been developing for several years for appointing another such committee. Conjecture is that it probably will continue to sit for about two years.

* * *

"Growers Raise Hob"

After the Legislature had adopted a bill to assess charges for farm products inspection and certification on a new basis—said to have been intended to raise state revenues by about \$35,000—the report came back from Albany that growers were "raising hob". In the absence of any official statement it was reported that the bill was "killed" in the closing days of the Legislature.

Information is that this bill originated in the budget bureau. Objection was taken by growers, shippers and farm organizations on the ground that the inspection service was practically self-supporting, that fees charged were higher than in some other states, that farmers could not afford to pay more in view of low prices they received, and that any increase in fees would make the service less useful.

* * *

To Study Apple Tax

A joint resolution introduced in the Legislature by Senator William Bewley of Lockport calls for appointment of a legislative commission to study a proposed advertising tax for apples. The bill was introduced at the request of some growers. There is divided sentiment in the apple industry as to whether or not there should be an apple advertising tax.

Two years ago the State Grange expressed itself in favor of such a measure, "if the apple industry wanted it." Last year the State Grange adopted a resolution sponsored by the Niagara County Pomona Grange favoring an apple advertising tax to be administered by an industry commission.

The Apple Institute has been operating for five years upon voluntary assessments and contributions by growers. There is general feeling that it has done a good job, but its support has been limited. Some growers pay their voluntary assessment of one cent a bushel, some make a contribution and others choose to be what has been dubbed "free riders."

Many growers have said that they would be willing to pay "if everybody else did," and others have queried "why should we pay when the other fellow does not." This has focused attention on state-levied assessments as in Washington and Michigan. At a number of meetings I have heard it emphasized that if and when there is such a state tax it should be administered by a commission nominated by growers who pay the tax. There appears to be no sentiment whatever for handing such a fund over to a departmental or political bureau. Personally, I remain neutral, believing that it is a matter which growers should weigh and decide.

Family Incomes and Milk Consumption

By LELAND SPENCER

ONE OF my associates, Dr. Charles Blanford, has compiled some very interesting facts about consumers' purchases of milk, cream, and evaporated milk in New York City. The quantities purchased at stores were determined by a survey of retail food stores last June. The quantities purchased from milk

Leland Spencer

dealers were determined by a check of the drivers' books for all retail routes in Manhattan and the Bronx.

In addition to the facts about milk purchases, Dr. Blanford also obtained the information necessary to classify different sections of the city according to the size of family incomes. The two boroughs of Man-

hattan and the Bronx were divided into 118 districts or census tracts, each having about 25,000 people. About 40 per cent of these districts were classified as low-income areas, about 50 per cent as medium-income areas, and 10 per cent as high-income areas.

Striking differences were found in the quantities and grades of milk and cream purchased by the families in these various districts. These are shown in the accompanying table.

CONSUMERS' PURCHASES OF MILK AND CREAM IN AREAS OF LOW, MEDIUM, AND HIGH FAMILY INCOMES, BOROUGH OF MANHATTAN AND THE BRONX, NEW YORK CITY, JUNE 1939.

Product	Family income level		
	Low	Medium	High
Quantity per person, daily			
Grade A milk (pints)			
Route	.048	.095	.207
Store	.028	.024	.060
Total	.076	.119	.267
Grade B milk (pints)			
Route	.058	.116	.191
Store	.020	.028	.059
Total	.078	.144	.250
All milk (pints)	.754	.863	1.038
Cream (1/2 pints)	.033	.074	.152

These figures show that families in the high-income areas used about one-third more fresh milk per person than those in the low-income areas. The families in the low-income areas not only used less milk, but most of what they used was Grade B milk bought at the store. This is to be expected, of course, because in New York City the prices of Grade B milk at stores are from 2 to 5 cents a quart lower than the prices for home delivery, and on the retail routes, Grade A costs 3 cents a quart more than Grade B. In the poorer districts, Grade A made up only 10 per cent of the total purchases of fresh milk, while in the well-to-do areas, 38 per cent was Grade A.

Evidently most of the people who have to get along on small incomes are economizing, as we would expect

them to do, by purchasing the cheaper grade of milk, by getting their milk at stores, and going without such luxuries as cream. The elimination of Grade A milk will affect consumers in the low-income areas very little, but will deprive the more well-to-do consumers of the choice of grades which has brought several million dollars of extra income to New York dairymen each year.

Eggs and Poultry

The egg-feed ratio continues high. Along the last of March it took 10 dozen eggs to buy 100 pounds of poultry feed. For the same week a year ago it took 8.8 dozen.

Reports continue to show fewer baby chicks hatched than a year ago. For the two-week period of March 1 to 15, commercial hatcheries reported 7 per cent fewer eggs set. Hatcheries in the New England States reported a reduction of 6 per cent, and in the Middle Atlantic States a reduction of 1 per cent.

On March 1 cold storage holdings of eggs in the United States were below last year and below the five-year average. Total holdings of shell and frozen eggs were equivalent to 1,152,000 cases, compared to 1,436,000 cases on March 1 a year ago and a five-year average of 1,611,000 cases. Dealers are reluctant to store at present prices.

Cold storage holdings of poultry are high. Including chickens, turkeys, and ducks, holdings on March 1 amounted to 144,743,000 lbs., compared to 116,229,000 lbs. a year ago and a five-year average of 113,431,000.

A government report indicates an intention on the part of turkey growers to raise between 4 and 5 per cent more turkeys this year than they did last. From some quarters have come protests against publishing these figures, stating that they are too indefinite to be of value. Figures show an intended increase of 6 per cent in the North Atlantic States. Looking at past history, we find in round figures a rather steady increase from 16,000,000 turkeys growing in the United States in 1929 to 32,000,000 in 1939. In New York State the increase for this period was from 167,000 to 368,000.

The Potato Market In Up-State New York

All potato markets are steady and have been showing a little strength during the past week or so. Factors influencing this healthy turn in the market are severe weather conditions in the northeastern states which hindered both rail and truck movement and enabled markets to clean up, and the light early crop from southern states which is of rather poor quality. How long this firm turn in the market will continue depends on how fast the remaining supplies go to market. An increase in price stimulates the flow of potatoes causing one extreme to follow another. It is thought that there are not too many old potatoes in many sections of the Northeast except perhaps Aroostook County, Maine, and the extended season this spring should give those growers a good chance to market their crop.

Prices have advanced so that good, well graded potatoes are now selling on the basis of \$1.60 per cwt. at the farm in new bags or around 85c to 90c bare. Pecks packed under the State Trade Mark are wholesaling in central New York cities at 32c with U. S. 1's in pecks bringing from 27c to 29c. The central New York wholesale markets on bulk potatoes range from \$1.60 to \$1.80.

WINS 11 BAKING PRIZES!

SAYS, "ALL MY PRIZE-WINNING BREAD WAS MADE WITH MACA YEAST"

Mrs. F. W. Zelle of Chestnut, Illinois Won 4 Baking Prizes At Her County Fair and 7 More At the Big Illinois State Fair Using Maca Yeast Exclusively.

New Fast-Acting Yeast That Keeps Without Refrigeration Chosen by Prize-Winner and Thousands of Other Home Bakers

THE double triumph of Mrs. F. W. Zelle in winning prizes at both her County and State Fairs with bread raised with MACA, is another "feather in the cap" of this new yeast. Her letter, telling her prize-winning experiences, is now in our files with thousands of other letters from home bakers telling that they have tried MACA, like it and depend on it!

Women are switching to MACA Yeast because they want the advantages it offers: (1) MACA acts fast. (2) MACA keeps on the pantry shelf. Yet there's nothing new to learn when you use it! You just dissolve

MACA in a cup of warm water and use it in your regular straight dough recipe.

We Think You'll Like Maca So Much That We'll Gladly Send A Package FREE!

Because we think you'll continue to use MACA, once you've tried it, we'll gladly send you a package free. Simply mail the coupon. Or if you want to use it tomorrow, buy it at your grocer's now. (Or send dime for three packages, postpaid.)

FREE OFFER COUPON

Answers to Questions About Maca Yeast

In addition to its baking use of course Maca can be eaten. It contains vitamins B₁ and G and the other vitamin factors of yeast, all naturally present.

NORTHWESTERN YEAST COMPANY
1750 N. Ashland Avenue, Chicago, Ill.

SICK, NERVOUS CRANKY "EVERY MONTH"?

Read WHY Lydia E. Pinkham's Vegetable Compound Is Real "Woman's Friend"

Some women suffer severe monthly pain (cramps, backache) due to female functional disorders while others' nerves tend to become upset and they get cross, restless, jittery and moody. Why not take Lydia E. Pinkham's Vegetable Compound made especially to help tired, rundown, nervous women to go smiling thru "difficult days." Pinkham's Compound contains no opiates or habit-forming ingredients. It is made from nature's own beneficial roots and herbs—each with its own special purpose to HELP WOMEN. Famous for over half a century. Try it!

Kernels, Screenings and Chaff

By H. E. BABCOCK.

ABOUT this time every year I get a bunch of letters from farmers who are planning on building new barns or repairing and improving what they have.

Typical Barn Questions

The questions asked in these letters show all of these farmers to be wrestling with the same problems. They have to do with the type of dairy barn to build. As one farmer puts it, he wonders whether he should rely more on silage in the new setup he is contemplating and build a proportionately smaller barn so far as haymow space is concerned or build the type of barn which provides plenty of storage of long hay and straw.

Results of Experience

I presume that the farmers mentioned above write their questions to me because I have been foolish enough during the last few years to refer repeatedly on this page to my experience in chopping hay and straw and in making grass silage. When I built my big barn at Sunnygables I had some of this experience behind me and as a result I designed my barn so that I was able to build laying pens for 2,000 hens in space which, normally, would have been reserved for long hay and straw storage.

Eight years experience operating my barn has convinced me of the soundness of the design I followed. I have ample storage space for hay and bedding in chopped form for all of the livestock I can house in the basement of a barn 240 feet by 36 feet. In between the livestock and the hay and straw storage I have warm, dry living quarters for 2,000 laying hens. My chopped hay and straw are in the top of the barn and are easily moved by gravity to where they are wanted. There is not a single major change in the setup that I would make today if I had to rebuild the barn.

Grass or Corn Silage

We have had splendid feeding success on our farms for five or six years with grass silage. We have made grass

silage with both molasses and phosphoric acid, and I defy even the expert to tell the two products apart. Very careful feeding trials may prove a technical superiority of one product over the other but in farm practice I know from experience that the net cost of the molasses or the phosphoric acid is the most important consideration for us in determining which one to buy.

My own personal interest now is focused not on which material, molasses or phosphoric acid, to use in making grass silage, but on what I can grow on the farm that will serve as a substitute for both. As I have said here before, I have high hopes of winter barley, winter oats, wheat, and even rye, as crops which can be mixed with clover and alfalfa to make grass silage. Despite my own experience with grass silage, which has been satisfactory, I still believe that for the average dairyman grass silage will be for a long time only a supplement to corn silage.

I also feel sure that the most dairy-men in the Northeast should do with it for the present is to make some in the silos they are using for corn silage and try it out.

Summary

Chopping hay and straw saves about two-thirds on storage space; field baling of hay and straw saves even more. Chopped hay and straw in the top of a barn where they can be fed down by gravity are easy to handle. Chopped straw in particular goes farther as bedding and makes manure which is better for top-dressing winter grain or meadows. Caution must be taken to have hay dry enough before it is chopped. Big piles of chopped hay should not be built up too rapidly. Grass silage is a practical feed for all classes of livestock. It puts more of a strain on a silo than does corn silage; more tons can be stored in the same sized silo. On the basis of present recommendations, purchased molasses or phosphoric acid makes grass silage expensive. The carbohydrates to mix with the clover and alfalfa which go into

In the December 23, 1939 issue I ran the above picture of Lady and stated that she seemed to me to be a most desirable foundation type for a line of old-fashioned farm dogs. Lady has now done her part in founding such a line. Two of her puppies, which very closely resemble her, are shown at the right. Lady belongs to Frank Naegely of Ithaca, New York, who has very generously contributed the choice of her puppies to Sunnygables.

grass silage should, if possible, be grown on the farm. The substitution of grass silage for corn silage should be tried out in the Northeast by practical farmers on a small scale until they get their own answers. They will be different for different farms and different localities.

* * *

Down Mexico Way

As I have previously stated, H. E. Babcock, Jr., is on leave of absence from our Sunnygables and Larchmont operations for the summer. He is located in Roswell, New Mexico where he is assisting the Superintendent in charge of the operation of approximately 750 acres of irrigated land used to grow cotton, alfalfa, wheatland maize and some oats and wheat.

I am, personally, thoroughly familiar with this farm and keep track of it through weekly letters which Howard writes me. On the chance that there may be some readers of Kernels, Screenings and Chaff who would be interested in following the seasonal operations and getting an insight into the problems of an irrigated farm growing a large acreage of cotton, I shall occasionally run excerpts from Howard's letters under the heading, "DOWN MEXICO WAY."

Howard writes reporting in part what he observed on his drive of eighteen hundred odd miles from Ithaca, New York, to Roswell, New Mexico, the last of March, and on what he found when he got to the farm, as follows:

"On the trip down I was surprised to find that our section and I suppose, all of New York State, is not the only part of the country that is behind in its spring work. In Ohio, although the snow was gone, there was about a foot of frost. I didn't strike any really green looking country until I got into Oklahoma. In Missouri they were drilling oats, however.

"Winter wheat on the whole looked pretty tough. Across the Texas Pan-

handle it was especially patchy. Reports came over the car radio of dust storms in that section, but they were one day ahead of me. It was quite windy all across Missouri, Oklahoma, and on down to Roswell. The last two days here have been exceptionally warm.

"The farm work at the ranch is in excellent shape. Everything now hinges around timely irrigation so that all work will coordinate. The only plowing left is the big cotton field. The largest section of this is over half plowed and sheep manure is being applied to the so-called hilly part.

"All of the planted fields and hay fields have been watered at least once. The one hundred acre alfalfa field has had its second water and been fertilized so it is coming along nicely. The field of volunteer oats is largely oats but shows some alfalfa. At the present time, it is being used as horse pasture, and the plan is to cut it for horse hay. After the oats are off it will be reseeded to alfalfa before watering.

"Lamb returns will not be in until Wednesday and we will ship another car Thursday. There will be about one carload of cut-backs left after this shipment."—H. E. Babcock, Jr.

Our home quick freezing and cold storage of foods continues to be a great money saver and a most useful means of setting a better farm table. Above is pictured a meal of products all raised at Sunnygables which can be assembled from our box at a minute's notice; turkey, peas, broccoli and strawberries for shortcake. Some day, home quick freezing of farm foods will replace home canning in the Northeast.

"Sympathy Cost Me Money"

SOME YEARS ago a man came into my store and put up a hard luck story of being a discharged Erie fireman. He had a watch, for which he showed a receipted bill (paid), on which he wanted a loan of \$28.00. He said he wanted to get back as quickly as possible to a job that was waiting for him in St. Paul, Minnesota, where his family lived. He also showed the pictures of his wife and two children.

I was very indifferent until he showed the pictures of his wife and children. I asked him if he could not do with less. He said the least he could use was \$26.00; so after some more talk, we agreed on \$26.00. The watch was sealed in a large envelope to be redeemed in thirty days. If not redeemed, it was to be opened and the \$60.00 watch was mine. You know a railroad watch is good, and the one he showed me was an Elgin.

I gave him the money, and he said he was going to jump a freight and start right back. However, I found out accidentally some days later that he went to a nearby town and did the same thing there and in other places. I opened the package, sent the watch to be appraised, and the jeweler said this watch retailed at \$4.95.—J. C., New York.

Crates Carry Disease

"I have 500 hens with bronchitis or colds, and 100 of them have died. I believe that they caught the disease from crates which a chicken buyer brought which we took into the poultry house."

It is entirely probable that our subscriber is right. It is a very dangerous procedure to take a poultry buyer's crates into a chicken house. Another thing to watch are scales and checks from men you do not know. There are a lot of honest poultry buyers, but a lot of them have been known to chisel on weights in a very clever way. On occasion, also, they have stopped payment on a check after it was given, on some flimsy excuse, and then have tried to persuade the seller to accept pay at a lower price.

Gas Tax Refunds

The New York State Tax Commission has made a new ruling on the refund of gasoline tax money where gas is used on the farm. Claims based on estimated consumption will not be approved. This means that, to get a refund, you must keep a record of the hours the gas engine was in use and the gallons of gas put into the fuel tank each day. This record should be attached to the application for refund. This ruling is in addition to other requirements. For example refund claims should be sent in every three months and will not be paid if over a year old. Claims must be accompanied by slips from dealers for all gas purchased.

Cobb Promises Restitution

In a recent issue we reported that Harry Wood Cobb and the Glen Rock Nursery of Ridgewood, New Jersey are out of business. Cobb was indicted for fraudulent use of the U. S. Mails about a year ago, was arrested, and on February 23, 1940, pleaded guilty. Judge Philip Forman of the United States District Court, Trenton, N. J. gave him a suspended sentence of a year and a day, and placed him on probation for three years, with the provision that restitution be made to customers for amounts due them.

It develops that Cobb had claims against him of over \$3,000. The Court directed the U. S. Probation Officer of Trenton to supervise the refunds to be made by Cobb.

A subscriber writes us the following letter:

"I would like a position in a Christian motherless home as housekeeper. I am a widow with a daughter 13 whom I would wish to have with me. I also have two other children, 18 and 21 years old, but they would not be with me."

If anyone would like to get in touch with the writer of this request, address the letter to L. C. P., American Agriculturist, P. O. Box 367, Ithaca, New York, and we will forward it.

Subscriber Wins \$25.00 Reward

Bellvale, N. Y.

AMERICAN AGRICULTURIST Inc.

L. Quackenbush
TREAS.

Arthur Quackenbush of Bellvale, Orange County, N. Y., is the latest winner of the \$25.00 reward which is offered by American Agriculturist under the following rules:

First, information must be given which leads to the arrest, conviction, and imprisonment of anyone who defrauds or attempts to defraud one of our subscribers. Second, there must be actual imprisonment for at least thirty days. Third, the subscriber who is defrauded, or on whom the attempt to defraud was made, must have an American Agriculturist Service Bureau sign prominently posted on his premises.

Mr. Quackenbush cashed a check for \$5.00, and when it was deposited in the bank, it was found to be a forgery.

He furnished the information that led to the arrest of the man who passed the check, and this information also led indirectly to the arrest of three other men. One received a thirty-day sentence, two 6 months, and the fourth was held for action of the Grand Jury. After checking to see that all requirements had been met, a \$25.00 check was mailed to Mr. Quackenbush; and along with this account you will find a reproduction of it.

We have two reasons for offering this reward. First, we wish to encourage our subscribers to follow up and prosecute cases of fraud. Second, we wish to make the yellow Service Bureau sign a warning to crooks that it is not safe to defraud an American Agriculturist subscriber.

The basis of a sound business cooperative is voluntary use by fully informed patrons

Market Quality

WHAT THE CANDLE TELLS ABOUT YOUR EGGS

ALTHOUGH a few buyers, such as ice cream plants and bakeries, judge eggs by their appearance when broken out of the shell, in most cases the price tag is put on an egg when it is candled on the market.

Apart from size, these are the things the candler looks for—

1. Small air cell
2. Light yolk shadow
3. Clear white
4. Clean, sound shell

As the egg ages and dries out, the air cell increases in size due to evaporation through the pores of the shell. The higher the temperature and the thinner the shell, the faster the evaporation.

Some hens do not inherit the ability to lay thick-shelled eggs, but most hens will lay eggs with good shells if they get enough oyster shells (or limestone grit) and cod liver oil.

The Yolk Shadow

The yolk has to be deep orange or red before it will appear dark in candling, providing the egg is fresh and has a good, thick egg white. What usually makes a yolk more or less visible is the thickness or thinness of the "envelope" which surrounds the yolk. This envelope can be plainly seen in a fresh egg when it is broken out into a saucer.

As an egg ages, the fibers in this envelope soften, and quite a bit of the material which gives it strength may be dissolved. When the egg is twirled before a candling light, the yolk will swing through it close to the shell and will cast a darker shadow if the envelope and the surrounding egg white are weakened.

Seeding Rates for Meadows

THESE SEEDING RATES are based on the use of seed which inherits the ability to produce a crop in this climate. Such hardy legume seed is protected by a thick seed coat which is practically waterproof. Unless water can get in and reach the germ, the seed will not sprout.

The G.L.F. Kem-Fee process thins down the coat of these hard seeds so that moisture can get in and start germination. It is a gentle process which does not injure the seed but does result in quick, strong germination, producing plants that get ahead of the weeds.

Depth of Planting Important

Grass and legume seed is small. When it is sown too deep the seedlings may never reach the surface. The ideal depth for a hay seeding is one-half inch to one inch. If grass seed is sown with a grain drill it may be necessary to make adjustments in order to avoid covering the seed too deep.

Producing quality eggs is an old story to Elmer Stone of Clyde, New York, who won three First Premiums for mediums and one Second Premium for large eggs at the 1939 New York State Fair. Mr. Stone puts his eggs in a humid cooling chamber as soon as they are gathered. He cleans, packs, and grades them carefully and ships to G.L.F. Marketing Service at Newark, N. Y. Mr. Stone feeds Super Laying & Breeding Mash, which contains 120 lbs. alfalfa meal and 529¾ lbs. yellow corn meal per ton. His eggs have been spoken of by several market men and at least two federal inspectors as the nearest thing to perfection they have seen.

Steps That Improve Quality

The things which speed up the softening of the egg white are age, heat, cold, and drying out. In order to keep up the strength of the egg white, eggs should be gathered at least three times a day in pails which allow for circulation of air through them and around each egg.

They should be immediately taken to the cellar or egg room, which should be kept moist and cool—as near 50° as possible, although no harm is done if it goes up to 60° Fahrenheit. The room should have just enough ventilation so that the air always smells clean and no mould develops. The quicker the eggs are cooled, the better they will hold up in quality.

Feed and Market Quality

Experiments conducted at Cornell by Wilgus and VanWagenen, at California by Almquist, and at Penn State by Hunter, all indicate that feed has very little to do with candling quality. About the only exception to this is that hens

eating a lot of green grass might produce eggs with yolks that would show up dark under the candle.

Practically all cooperative and commercial rations on the market produce eggs of good quality. Five to seven per cent of alfalfa meal in the mash will not darken yolks sufficiently so that any difference can be detected in candling.

Passing the Candling Test

To produce eggs that will pass the candling test, then, the following steps are necessary:

1. Hens must be healthy and well cared for.
2. Eggs must be gathered at least three times a day.
3. They must be cooled under humid conditions as quickly as possible.
4. They must be protected against high and extremely low temperatures on their way to market.
5. They must be shipped off to market frequently.

Fence That Lasts a Lifetime

IN INDIANA, there is a saying that you can tell if a man's note is good at the bank by looking at his fence. The best farmers out there use No. 9 wire for fencing. They call it "railroad specification" fence and it is good for about forty years.

Most of the woven wire fence sold to farmers here in the East is No. 12½, which figures to last about fifteen years. The Standard Unico grade is No. 11, which steel men consider about a twenty-five-year fence.

But the farmer who wants to put up a fence that will last his lifetime should ask his G.L.F. Service Agency to get him the No. 9 fence. The fence itself costs more; the posts and the labor are just the same. The cost per year of service will be far lower.

THE FARM PAPER OF THE NORTHEAST

"DEMOCRACY *In Action*"

I Observe a Vermont Town Meeting

By JARED VAN WAGENEN, JR.

IT IS VERY easy for me to chant the praises of Vermont because I have for the state something more than a casual tourist acquaintance. A good many years ago—in 1914 to be exact—I was so fortunate as to be a recruit in a barn-storming Farmer's Institute campaign which carried me into every county of the state. Since then almost every year I have gone back once or twice for some sort of a meeting, and so it is that when Vermonters foregather to discuss their State I can listen with some degree of understanding.

It is sometimes the fashion to accuse the rural Yankee of being a sour, dour individual, economical of everything including conversation. I insist that this statement is gross libel. As I have met the Vermont farmer, he has displayed a quiet, cordial friendliness which has seemed most delightful.

The state is more predominately rural than any other region in northeastern America. The two largest cities are hardly more than big villages. Every town, no matter how small the population, sends a member to the lower house of the State Legislature.

Vermont has approximately a third of a million people—a number that has fluctuated within only very narrow limits during the past seventy-five years. Formerly the state had two members of Congress but by a recent reapportionment this is reduced to only one. I am told, however, that this lone Congressman represents a more numerous constituency than any other member of the House.

In its annual Town-Meeting, rural New England has an institution which is absolutely unique in America. I once heard a University Professor of American History declare that the New England Town-Meeting was the purest democratic institution remaining in the world, and this in a world where we sometimes fear that democracy is on its way out. The Town-Meeting is a survival of Colonial days and in the remote towns where there are no cities or overgrown villages, its form and spirit have not greatly changed during the lifetime of this Republic.

Each year on the first Tuesday after the first Monday in March, the qualified electors

Town. It has an area of 26,387 acres and about 600 inhabitants. Seventy-five years ago, in what were its halycon days, it had probably double its present population. I do not know what proportion of its land may be considered tillable but perhaps one quarter would be a fair estimate. Driving up the valley of West River, walled in by high, semi-precipitous hills, one would be led to believe that there could be no agriculture outside of the narrow ribbon of flats that skirt the stream. Hidden away among the hills, however, are some very good farms. A lister ("lister" is the Vermont word for what we call an "assessor") told me there was no farm in the town valued at as much as \$8,000.00.

Townshend village, population 196, looks

The Town Hall at Townshend, Vermont, where each year, on the first Tuesday after the first Monday in March, the voters of the town gather to transact such town business as may properly come before them.

of the 246 towns of Vermont gather in their respective Town Halls to settle such matters of business as may properly come before them. On March 5 I journeyed to that state specifically that I might observe the procedure of one of these township Parliaments, and out of what I saw and learned make a little story for *American Agriculturist*.

I went to Townshend, primarily I suppose because I am fortunate enough to know a man who lives there and who was in my class in college more than fifty years ago. Homer J. Heath was a New York state farm boy but he has now lived in Vermont for thirty years and has become almost as good a Green Mountain man as if he had been to the manor born. Then, too, I think there can be no doubt that Townshend is a very typical Vermont Hill

distinctly well kept with attractive business places and plenty of fresh paint. Emphatically it has not that unkempt, run-down-at-the-heel air which characterizes so many little rural villages. Its most noteworthy land mark is the ancient Congregational Church. Built in 1793, it still stands in simple dignity as a worthy example of the ecclesiastical architecture of New England.

The town has its claim to distinction in the character of men it has sent out into the world. A mile and a half up the stream lies the farm where was born the father of Liberty Hyde Bailey. In Townshend village lived, also, the grandfather and father of President Taft, and out of the hills came a boy who eventually became President of the Wabash railroad. The Hill Towns of New Eng- (Turn to Page 24)

MOST people would answer that question by saying, "The Interstate Commerce Commission"—and that answer is right, as far as it goes.

But when you get right down to it, the thing that governs freight rates *as a whole* is the fact that railroads must take in more money than they pay out. No business can keep on operating unless it does that.

Now tracks have to be kept up and trains have to run—whether they have a big load or a small one. When the total volume is small, therefore, it costs more to haul every ton of freight.

So one thing that governs railroad rates is volume of business—the total amount of freight shipped by rail year after year.

And what interests you as a shipper is this:

Anything that takes freight away from the railroads increases their cost of hauling each

ton they handle and makes it harder for them to keep their rates down to their present low level.

This subject was thoroughly discussed in a recent report by Mr. J. J. Deuel, Director, Law and Utilities Department, California Farm Bureau Federation, and the conclusion Mr. Deuel reached was this:

"The conditions under which the railroads compete for the traffic they require to sustain them, are a matter of utmost concern to farmers. The smaller the proportion of such competitive traffic the railroads attract, the larger the proportion of total cost of sustaining rail service the farmer will be compelled to shoulder."

That's one important reason why farmers have a vital interest in seeing that the railroads get a fair deal in regulation, and a chance to compete for business on equal terms.

"SEE AMERICA" FOR \$90

Start from your home town now on a Grand Circle Tour of the United States—east coast, west coast, border to border—go by one route, return by another—liberal stopovers—for \$90 railroad fare in coaches—\$135 in Pullmans (plus \$45 for one or two passengers in a lower berth). Get the full facts from your ticket agent about the greatest travel bargain in history!

ASSOCIATION OF AMERICAN RAILROADS

WASHINGTON, D. C.

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

AGAIN THIS YEAR the National Grange has joined with other safety groups and automobile organizations in offering a series of prizes to the subordinate Granges of the United States for outstanding accomplishments in highway safety. The cash prizes offered from the same sources during recent years have been vigorously competed for and similar inducements will lead many subordinate Granges to exert their utmost efforts for 1940.

Last year an Oregon Grange won first place; Hebron Grange, No. 111, at Andover, Connecticut, second; with third award divided between Wisconsin and Minnesota contestants. The first prize is \$100 in cash. Beyond the first three awards, \$10 and \$5 inducements go to Granges according to work done. The latter includes marking danger points, clearing obstructive views of highway, meetings and local safety campaigns, awakening interest among school children, etc.

SUNDAY, MAY 19, marks the annual state-wide Church-Grange Sunday in Connecticut, held at the State College in Storrs. The guest speaker this year will be National Master Louis J. Taber. Some years practically every one of the 150 subordinate Granges in Connecticut is represented at the service and attendance has often exceeded 3,000 Patrons and friends. A regular morning church service with basket lunch at noon is followed by a high-class afternoon program of music, speaking and other inspiring features.

THE ANNUAL state-wide Bird Day of Massachusetts Granges is scheduled for Saturday, May 18, and will be held this year at Upton, near the center of the state. Bird walks, planting of trees, addresses and other appropriate features will be carried out under the direction of the State Grange committee on Conservation and Birds, whose chairman is Henry N. Jenks, of Cheshire, former State Master.

RHODE ISLAND Granges are working up lots of interest over a potato growing contest this season. High-class seed is being distributed by the State College at Kingston and subordinates will vie with each other as to which can raise the largest yield and best quality from such seed. The potatoes will be judged in October.

ONE OF THE BEST meetings held in any Vermont Grange this season was a "Know Your State" program, recently staged by Williamstown Grange. It brought out many important facts concerning the Green Mountain State, expressed in essays, a "quiz", roll calls, etc. By means of a large map the audience was taken on a "Vermont trip," visiting the principal points of interest, including mines, quarries, factories and beauty spots. As the climax of the "trip" all were served generously with maple sugar, doughnuts and pickles.

CONNECTICUT PATRONS are very proud of the fact that their popular Governor, Raymond E. Baldwin, and Mrs. Baldwin have just been initiated

American Agriculturist, April 27, 1940

as members of Housatonic Grange in Stratford, which is their home. Both the Governor and Mrs. Baldwin received their degrees in full form. The occasion was a great rally evening for the Granges of Fairfield County. Governor Baldwin has spoken before many large Grange gatherings in Connecticut, including two annual sessions of the State Grange.

24 MAINE GRANGERS were presented with Golden Sheaf certificates during the month of March. These certificates attest the completion of at least 50 years of continuous Grange membership and service. In the country as a whole nearly 3500 such certificates have been awarded to veteran Patrons.

SEVERAL MASSACHUSETTS Granges have initiated classes of upwards of 30 members since the beginning of the new year. The high mark goes to Shrewsbury, near Worcester, which recently initiated 50 new members in a single class. There is also likelihood of two or three new subordinate Granges being organized in Massachusetts before hot weather.

CONNECTICUT has another new subordinate Grange, located at Madison, with a fine charter membership enrolled on April 8. On the same evening in Fairfield County a new Juvenile unit was organized.

NEW HAMPSHIRE Granges have done an astounding amount of community service in the past 12 months. Generous gifts of money have been made to the American Red Cross, New Hampshire Society for the Care of Crippled Children, Golden Rule Farm Home, the State Educational Loan Fund and the New England Grange Building; also cash contributions to hospitals, churches and Sunday schools; for dental clinics, cancer control and similar worthy objects. Real help has been given to several families who have lost homes and furnishings by fire and innumerable gifts of clothing, especially to aid needy children, who would otherwise have been prevented from attending school. Several free beds in hospitals are maintained by New Hampshire Granges and gifts of radios to shut-ins and aged have been almost without number.

DURING MAINE'S Farm and Home Week this year the list of outstanding men and women who were honored with certificate awards included two well-known farmers, Frank B. Day of Durham and Fred J. Nutter of Corinna. These two alert farmers were indicated as having made distinctive contributions to the agriculture of Maine, as well as for valuable service to the upbuilding of the Grange in the Pine Tree State.

"I don't mind staying after school again, teacher, but I think you should know that half the town thinks we're going steady!"

HILL COUNTRY . . .

By
John P. Willman*

Sheep Production

SHOULD much of our typical hill lands of New York State be allowed to go back to trees or are some of these areas suited to large-scale sheep production? To obtain answers to this and other important questions is the chief object of an experimental sheep farm located in Livingston and Ontario counties, a few miles from Springwater, New York. The farm, known as the Kenwood Sheep Farm, purchased during the fall of 1937 by Kenwood Mills, F. C. Huyck and Sons, Albany, New York, is operated in cooperation with the

This included oat hay, soybean hay, soybean and sudan grass hay and wild hay cut from this farm and 35 acres of mixed grass hay from a neighboring farm. A total of two acres of potatoes and 900 bushels of oats and barley grain were harvested. About 35 tons of peavine silage were purchased for feeding during the winter of 1938-39.

In spite of the drought conditions prevailing in that section of the state in 1939, the farm produced 1250 bushels of rye, 1150 bushels of oats and barley, and about 105 tons of hay. The

lamb feeders and were delivered at the farm in April 1938. Their average purchase weight when less than a year of age was a little more than 90 pounds. They were sheared soon after delivery and produced fleeces with an average weight of 8.3 pounds. The farm was purchased too late in the fall of 1937 to harvest feed for wintering a ewe flock.

These ewes are medium to large in size and yield fleeces that are not as fine as those produced by the average flock of western ewes found in this state. Kenwood Mills prefer to produce as much quarter blood and low quarter blood wool as possible because these coarser grades of wool are not produced in large quantities in this country. They use large quantities of this wool in their manufacturing business. This original flock of ewes appear to be sired by Cotswold rams and probably are out of grade Rambouillet ewes.

During the breeding season for the 1939 lamb crop, about 100 of the ewes that had produced the heavier and finer fleeces were mated with Cotswold rams, about 60 of the best ewes that produced three-eighth and quarter blood fleeces were mated with two

lambs and weaning time and all sheep and lambs were drenched again after the weaning date. The flock was moved from one pasture to another every two or three weeks throughout the summer.

Twenty-eight of the best ewe lambs sired by the Cotswold rams and seven sired by the best Shropshire rams were saved for breeding purposes. On November 27 a total of 63 lambs with an average sale weight of 82 pounds sold for ten cents per pound on the Buffalo market. The following day 64 lambs with an average sale weight of 83 pounds also brought ten cents per pound. A month later 65 lambs with an average weight of 80 pounds each and 47 lambs with an average weight of 72 pounds each sold for nine and one-half cents a pound while only five lambs brought eight and one-half cents per pound liveweight.

Late in the fall of 1939 the size of the flock was increased by the purchase of 200 head of white-faced Wyoming yearling ewes. These ewes are large for their age and are sired by purebred Cotswold rams and are out of grade Rambouillet ewes. We have been informed that the mothers of these yearlings sheared fleeces in 1939

▲ Part of the 200 head of white-faced western yearling ewes purchased in November, 1939. In the background is a straw shed 24' x 110' in which these ewes were housed.

New York State College of Agriculture. The experiment is to be run for ten years.

This 600 acre farm lies at an elevation of 2,000 feet. Most of the land had not been farmed for several years and was in a low state of fertility. There were no tools or livestock on the farm and the few fences that remained were in poor condition. There was on this farm a large barn and a large farm house each in fair condition and two other houses of little value. One of the houses was torn down, nothing was done to the other, and the third was prepared for occupancy. The barn was given a few repairs and now contains space for a cow, a few pigs, four horses, and enough room for 450 or more sheep. In 1938 about 1600 rods of woven wire fence was erected, and in 1939 another large shed with a floor area of 24 x 110 feet was built chiefly from poles cut on the farm and from material obtained from old barns located in the neighborhood. Rye straw grown on the farm serves as a roof.

Even though there are 300 or more acres of land on this farm that may be plowed, only about 85 tons of all kinds of hay were harvested in 1938.

average yield per acre was 17.7 bushels of rye and 41 bushels of oats and barley. These amounts of grain were in excess of the needs of the flock wintered during the winter of 1939-40. Some surplus grain was sold, but some additional hay was bought.

Oats, barley and rye have served as nurse crops to the new seedings. Applications of manure, limestone and superphosphate have been made to the cropland and some permanent pasture areas have been improved. Two small test areas were sown to a pasture mixture. Past experience indicates that it is possible to raise very satisfactory feed for sheep on this farm. The plans for the future involve the use of 200 to 250 acres of the better fields for grain and hay production, while the remainder will be used for pasture. There are numerous areas of brushy land that may be cleared as more pasture is needed. Some of these brushlots formerly were used for growing potatoes or other crops.

The original flock consisted chiefly of crossbred longwool-finewool ewes that originated in Wyoming. A total of 302 head of ewe lambs were selected from the feedlots of Genesee County

▲ A general view of the buildings at Kenwood Sheep Farm.

specially selected Shropshire rams; and the remaining ewes were mated also with Shropshires. Nine rams were used and breeding season began on December 1, 1938.

The flock was shorn on April 15, 16 and 17, 1939. The average weight of fleece for 308 ewes and rams was 8.7 pounds. The first lamb was born on April 19 and only five ewes lambed after May 30. Only six ewes failed to produce lambs in 1939, and 285 lambs were weaned. Drought conditions in that section of the state prevented normal pasture growth but the lambs weighed a little more than 60 pounds each at weaning time in early September.

Sheepmen who saw these lambs were much impressed by the absence of culls. Their condition seems to show that it pays to control internal parasites. The lambs were drenched three times and the ewes four times between

which averaged 14 pounds each. The total sheep population on this farm on January 1, 1940 included 15 purebred rams, 35 grade ewe lambs, and about 495 ewes. The ewes have been bred to lamb in May.

The farm power consists of three medium-sized horses and a tractor. A used truck has been acquired and most of the necessary tools have been purchased. The farmer grew his home pork supply, keeps one cow, and a small flock of chickens.

More ewes will be added to the flock as soon as the farm produces sufficient pasture and winter feed to justify this addition. The farm should provide feed for 700 ewes and their lambs. The present plans call for a four-year crop rotation. Perhaps a special crop such as potatoes, beans or some other cash crop will be added.

The farm is financed by F. C. Huyck
(Continued on Page 15)

Evening red and morning gray
Helps the traveller on his way;
Evening gray and morning red,
Brings the rain down on his head.

—Old Country Saying.

Corn Hoarding Helps No One

MORE THAN 500,000,000 bushels of corn are now sealed and held by the United States government against loans of 57c a bushel. For the long-time welfare of either corn growers or feeders this great hoard of corn is a menace. From the corn grower's standpoint, it hangs over his head as a great market uncertainty and a constant drag upon prices. Even corn growers who now favor it will be up in arms when this tremendous volume of corn is released.

From the standpoint of eastern dairymen, poultrymen and other feeders throughout the country, this hold-up of the natural flow of grain is utterly unfair and unjustified. Past experience with government crop hoarding has always been disastrous to everybody concerned.

Don't Do It!

HOLTON V. NOYES, Commissioner of Agriculture and Markets for New York, is right when he continues to emphasize that a big surplus of milk will surely result in too low prices to farmers. Grain fed to dairy cows is the highest in years. Both dairy cows and milk production are on the increase. Only so much milk can be sold in Class I. Every pound beyond this beats down the classified price. Says Commissioner Noyes:

"During February of this year 73 per cent of all milk marketed under the marketing order was used in the upper or fluid classes. This left a balance of 27 per cent which had to be used in the manufacturing classes, at prices determined by world-wide competition. Should production in June have increased 50 per cent, and the same amount of milk used in the fluid classes as was used in February, more than half of it would bring to producers only the low manufacturing prices, and this would inevitably drive down the blend price."

"I hope," concludes Commissioner Noyes, "that farmers will not stimulate additional over-production."

Let's Raise a Little Hell

WE ARE nearing the time again when farmers will have to begin contending with the Daylight Saving nuisance. It was bad enough when Daylight Saving first started, when it was confined to the larger cities, but in recent years even many of the smaller towns and cities have gone on fool time.

There has been in the last few years much sincere effort on the part of Chambers of Commerce and other groups of town and city business men to try to understand farm problems and to cooperate with the farmer for better social and business relations. That is a move in the right direction. But much of it is offset when a city or town, largely dependent upon rural patronage and cooperation, will have so little consideration or understanding as to pass a Daylight Saving ordinance. City and village men may be able to kid themselves by setting the clock back but the farmer knows he can't fool the sun. Business such as haying is regulated and determined by the sun and not by the clock. No matter what is done with the clock, he cannot start haying until the morning dew is off, and, Daylight Saving or no, the farmer cannot stop many

of his farm operations in the middle of the afternoon.

If the farmer attempts to run his business on Standard Time, then he is constantly inconvenienced and irritated because his time conflicts with that of the nearby town and city.

I am beginning to wonder recently if farm folks don't take too many things lying down? Do you friends in the cities and villages know how you feel about Daylight Saving and on other problems? If not, you are to blame and not they! What have the farm organizations done in effective resistance to Daylight Saving? If a majority of you want Daylight Saving, that is one thing; if you don't, why don't you do something about it as an organized group?

Last Chance This Year

IN THE big rush of spring work let us not forget some of the newer farm practices you decided last winter to try. Just to remind you, here is a list for your consideration. Remember that when the spring is over you have lost a chance on most of these for another year:

1. A Bigger, Better Garden

(a) It should be laid out in rows so it can be cultivated by machinery, and should contain a wide variety of vegetables, at least some flowers—for one does not live by bread alone—and a new plantation of strawberries, raspberries and blackberries.

2. Home-Grown Meat

(a) At least enough hogs for family use, with preparations to grow them on pasture.

(b) At least one fat calf and possibly a fat cow, with arrangements to exchange meat with a neighbor or neighbors so as to provide a steady supply of fresh meat.

3. Pasture Improvement.

Thousands of the best farmers are doing it. It is not difficult. Now is the time to get started.

4. Grass Silage.

A new practice that is rapidly growing.

5. Emergency Hay.

If hay was short last year, and seeding this spring poor, better be prepared.

6. More Grain for Home Feeding.

7. Double-crossed Silage Corn.

The variety known as 29-3 gets big results.

8. Calfhood Vaccination.

This is the best known control for Bang's Disease. It works. Talk with your county agent or veterinarian or write *American Agriculturist*.

A Book You Will Like to Read

"THE MAP of western New York", says Samuel T. Williamson, author of the biography *Frank Gannett*, just off the press, "looks as though someone had dipped his fingers in bright blue ink and then streaked them across the page. One of these Finger Lakes is Canandaigua, which is rimmed at its southern end by high hills, and one of these hills is the highest in western central New York. The early settlers avoided it. To it after the Civil War came four brothers named Gannett. They cleared it of blackberry and blueberry bushes, and on it Frank Ernest Gannett was born in 1876. Heredity, environment, and circumstances surrounding him were those of our most primitive pioneering days."

If you can read those opening sentences and then not finish the book, you are indeed hard to interest, for this biography is a rare example of a skilled and interesting writer recording the life and work of a great man in such a way as to

"The great rural interests are human interests, and good crops are of little value to the farmer unless they open the door to a good kind of life on the farm."

—THEODORE ROOSEVELT.

make that life sound like what it really was and is, a wonderful adventure. It beats all the best selling novels, because truth properly recorded is always stranger and more interesting than fiction.

Frank Gannett's life, from poor boy to newspaper publisher, is another example of what American opportunities when properly used can mean to boys and girls. *Nothing is so important as preserving those opportunities.* One of the effects of reading a good biography, and this one is no exception, is the inspiration it gives to do bigger and better things ourselves. As Kipling said:

"Go and look behind the Ranges,
Something lost behind the Ranges,
Lost and waiting for you. Go!"

Copies of the biography should be on every reading table. It can be had beautifully cloth-bound from any book store at \$2, or may be purchased in paper covers direct from Leaders and Events Syndicate, 210 East 43rd Street, New York City, at \$1.

Eastman's Chestnut

IN RECENT issues I have had a lot of fun kidding Arthur Deering, Dean of the Maine State College of Agriculture, about the hard winters and the deep snows of the State of Maine. I even printed a cartoon showing a railroad engine lost in the snowdrifts in a farmer's barnyard "somewhere in Maine", with the engineer leaning out of his cab and saying to the farmer, who was shoveling a path through the snow: "If this ain't the railroad, where is it?"

Since then Arthur has been bidding his time to get even, and believe me, the terrible winter we have just had in New York State gave him his chance, and he didn't miss it. He came over to Ithaca to attend the *American Agriculturist* Master Farmer Banquet during Farmers' Week, and the day he was due to arrive not a single train ran in or out of Ithaca because of the snow. Naturally, I have not had much to say about winters in Maine lately!

Now Arthur comes through with a letter, which reads as follows:

"While reading Carman's *American Husbandry* the other night I came across an historical fact of mutual interest. It was in regard to winters TYPTICAL of New York State, and about them Dr. John Mitchell wrote:

"In winter the snow lies deep, and for two or three months; and they travel on it in sledges (when they are able to go about at all—A.L.D.). Sometimes indeed the cold is extraordinary great; . . . in January 1765 . . . thermometer fell 6 degrees below 0, which is 21 degrees below 15, the greatest cold in England. Water then froze instantly, and even strong liquors in a very short time. And we are told it is not uncommon there to see a glass of water set upon the table in a warm room freeze before you can drink it."

"Never mind, Ed, it won't be long now before you can crawl out from your igloo and shed your red flannels for a few short weeks, at least."

All I have got to say to this is that I don't have to go back to 1765 for examples of hard winters in Maine! Also, Arthur, never kid an editor, because he always has the last word!!!

With Outstretched Hand—

*“Easy” Relief is Killing Thrift and Initiative,
and Encouraging Chronic Need.*

— By EDA MANN —

EDITOR'S NOTE: The following emphatic article on this page by Mrs. Mann is not meant to be any reflection on those unfortunate persons who, because of hard times, and through no fault of their own, are unable to care for themselves. Every good citizen expects to do his part to help take care of them. But in the vast army on relief the worthy ones are in the minority. Every farmer, and all the thousands of other workers who are struggling to make both ends meet and to pay their own bills and stand on their own feet, will approve Mrs. Mann's outspoken statements.

The remedy for this situation is to decentralize relief back to local control, cut out the politics with which relief is now cursed, and let the dead-beats work or starve.

EACH YEAR we are asked by social workers to contribute to this or that charity and we give half-heartedly. After all, we pay taxes to help defray the expenses of the needy. However, if we could feel that our contributions would help to rehabilitate the shiftless, we would be more eager to give.

In one little town of six hundred population, in upstate New York, relief is causing the working citizens much concern. The shiftless men of that village stretch out their arms for charity and then sitting back, smoke their pipes. Without physical effort on their parts, warmth and food are provided them. Back in the hills, a dairy farmer cuts his own fuel for warmth and, depriving himself of every luxury, he eats as a daily diet, yellow turnips and plain boiled potatoes raised by the sweat of his brow. This farmer seems foolish even to himself, because it is he who labors from sunrise to sunset to earn enough money to pay the taxes that help support the shiftless. Should a farmer need additional help and try to find someone among the unemployed to assist him, none are available. Excuse? Work is too hard!

With dozens upon dozens of families on relief in his town and surrounding territory, the dairy farmer can get no help. One farmer grown too old to work his farm alone, built a tenant house of five rooms, including every possible modern convenience, even a shower bath. The house was a temptation to each man he approached with the offer of a job. Not one lived in such a clean, modern little house and each was anxious for the opportunity. None, however, was anxious to do a bit of work. Suitable wages, free housing, electricity and milk, as well as the opportunity to make a garden, held no interest for them for two reasons. One, the farm was located three miles away from the town's movie house and, second, it seemed silly to work as strenuously as a dairy farmer must, when they could get provisions without exertion.

That dairy farmer has had eight charity-supported families in his tenant house in the last two years, and not one of the men worked more than two weeks before declaring that it was “damn foolishness to work so hard when there are organizations so willing to provide for one!”

“Interest in what Mrs. ‘On Relief’ is getting.”

In another town, somewhat larger and more industrial, the head of one family “on relief” received a sizeable bonus for his world war duties. He cashed the check, spent every cent of it on flimsy decorative furniture and a vacation trip, and then settled back to being supported.

A fourteen year old boy with more ambition than the usual off-spring of this type of family accepted a job of mowing lawn for a widow. His pay was to be \$2.00 a day, but his father refused to allow the boy to report for work. “My boy is gonna git \$3.00 a day like a man or he ain't gonna work for nobody.” And the boy spent his summer in idleness.

Their eyes are greedy with interest on what Mrs. On Relief next door is getting. A school physician prescribed a pair of glasses for a needy youngster, the glasses to be donated by charity. For weeks every family on relief swamped this doctor with demands for glasses for every one of their many children, with eyes good or bad. Likewise when Mrs. On Relief was rushed to a hospital to part with her appendix, every man and woman on relief for miles around developed symptoms of appendicitis!

I gave a “lift” to a gaudily dressed woman hitch-hiker one day shortly before Christmas. She was on her way to the city nine miles distant to buy a doll carriage for one of her little girls. True, organizations did provide her youngsters with toys, but none had given a doll carriage. She discussed her personal affairs freely. She had nine young children; each had had his or her adenoids and tonsils removed with public aid footing the bill; the children's clothing as well as her own and also their food was free to them through public aid. Her husband was a stone cutter by trade, but there was little call for a stone cutter, so he was almost steadily out of work. I asked why he didn't accept any job as long as it paid him a wage.

“Well, you see, stone cutting is really his trade,” was the quick rejoinder.

Organized Hitch Hiking

Similar to that case was one that amused my husband and me last July while we were traveling through the States. In talking with farmers, we found them lamenting the shortage of help for the haying season. Later, driving

along one of the main highways of Ohio, we stopped to pick up a man and a woman, who were hitch hiking. They did organized hitch hiking—planning their routes carefully; having listed towns and the various free accommodations each provided as to shelter and food. The man was equipped with his honorable discharge from the army, his marriage

certificate, and a letter from his last employer stating that he had been “laid off” rather than “fired”. They also had a small dog with them.

As they climbed into the rear seat of our car, the woman pulled a compact and lipstick from her pocket and proceeded to repair her face, remarking: “My goodness, we look as bad as farmers!” To that I found myself replying truthfully, but somewhat mischievously, “We are farmers.”

Our passengers were talkative. The man told us that he was a telephone lineman who had been out of work for more than a year and that he

Three dollars a day or nothing.

traveled from town to town in hope of locating a telephone job. My husband suggested to him, that inasmuch as there seemed to be no shortage of telephone linemen, perhaps a temporary farm job with its free lodging and food as well as its wage, might tide him over. The lineman and his wife were both heartily amused and pooh-poohed the idea.

During part of our ride together, they discussed the various charity organizations that accommodated them from time to time. One of this country's most famous ones, the Salvation Army, disgruntled them considerably. That organization had the audacity on one occasion, it seems, to suggest that they leave their dog at the pound since they really couldn't afford to care for the animal; and then to add insult to injury had, despite the couple's marriage certificate, “put them up” in separate quarters for the night.

A State of Mind

Only about twenty-five families out of every one hundred accepting public aid are charity cases by circumstance. The other seventy-five families are charity cases by temperament. Yes, the majority are chronically needy, each being able to look back along a procession of forefathers as lazy, uncouth and delinquent as they themselves now are. And each as clever. Each having at his or her finger tips the committees to get in touch with if help is needed. Mrs. Chronically Needy knows just where to go for aid at the slightest provocation, and she sends out an S.O.S. to the nearest charitable organization the instant a cloud appears on her horizon, be it only a cottony tuft that would disappear at the least breeze. But she is too lazy to pucker up her lips and blow!

Should one of her numerous youngsters have only a minor ailment, she cries out to the district nurse that she has so much house work to do that she can't care for her sick child. Subsequently, while the nurse bathes the child, feeds it and empties the chamber that has gone unemptied for days,

the mother pretends to be busy. Yes, pretends. For her home shows no sign of tidiness, her children no sign of cleanliness, and no substantial food is cooking. The relief money buys bread, canned fruits, ice cream and penny candy. There's always money for movies and gaudy shades of fingernail polish and permanent waves for even the twelve-year-olds! What a distorted sense of values!

One of my neighbors, while traveling during the holidays last winter, was stranded in a town in the mountains because of a snow storm. She offered her services to the local charity organization, where an official informed her that it was customary for those interested to “adopt” a family during the Christmas season. By “adopting”, they explained, was meant providing completely the needs of one family. My neighbor fell in with the plan and from a list of needy families, she chose a family of three considered extremely poverty stricken. She called on them to investigate their needs and then took them to the local stores to outfit them.

In selecting footwear, my neighbor suggested sport oxfords with sturdy soles and low heels for the woman, because she felt that the weather warranted them. The woman giggled nervously in response and stated flatly that they were clumsy and selected for herself patent leather pumps with 2½” Louis heels. The most practical thing my neighbor admits buying was a ton of coal.

Cleanliness Costs Little

When you see a group of children on the street, you can easily single out those belonging to the shiftless families. They are the dirtiest ones,—the ones with faces smeared with cheap candy; and there is always dirty underwear showing forth, as though it cost money to be clean! And always, too, they are the boldest, most brazen of the lot, and in them at an early age one sees the making of another wasted citizen because children imitate their parents. They are shown by example, as well as teaching, that the Lord in the guise of their working neighbor will provide; and thus they loaf and through idleness drift into crime.

Let him cut his own wood.

A rural community lends itself to a rehabilitation program. Instead of delivering coal to a relief client's cellar, could he not be expected to expend a little effort for fuel?

If the money covering the fuel allotment was used to purchase a woodlot and necessary tools, and those in need of fuel put to work at hewing out their own, the hard working citizens would feel less disgruntled.

In many instances, it wouldn't be necessary to purchase a woodlot. Farmers would be glad to turn over their woods to be cleaned of dead trees and underbrush.

This practice would not lessen the tax burden particularly, if at all, but it would help to rehabilitate the rural shiftless.

LOOK for this SIGN when you need that spark plug cleaning service that saves 1 gallon of gas in 10

More than 70,000 garages, service stations, and dealers clean and regap spark plugs by the famous "AC Method." They give this service because all plugs need cleaning and adjusting every 4,000 miles. Today's fuels and modern driving habits cause plugs to get dirty quickly. Dirty plugs misfire intermittently, especially under load. Then gas is wasted, power is cut, and starting ease is lost. So, have your plugs cleaned every 4,000 miles "the AC way." It costs only 5c a plug.

There's a Registered AC Cleaning Station NEAR YOU

AC SPARK PLUG DIVISION • General Motors Corporation • FLINT, MICH.

Look for this Trade-Mark when you need those spark plugs that assure best engine performance

More cars and trucks are factory-equipped with AC Spark Plugs than with any other brand. This has been true for years. Of the cars built in the last ten years which are still in use, 55% were originally AC equipped. The spark plugs that satisfy the men who build cars and trucks are safe for you to buy, and sure to satisfy you, too. They are also easy to get, because automotive retailers of every kind, everywhere, stock and sell AC Quality Spark Plugs.

Get a set—and GET THE DIFFERENCE

A good start toward a bumper crop. There are no weeds, and the corn is not too thick.

A TON OF SILAGE— What Does It Cost?

HOW MANY dairymen know what it costs them to grow a ton of silage? Men who study feeding claim that a ton of silage is worth about one-third as much as the price of hay at the farm. A cow is not particularly interested in what it costs to produce silage; she will produce just as much milk with a ton that cost \$5.00 as on one that cost \$10.00. But regardless of what silage is actually worth for feeding, careful accounts kept on many different farms show that the cost per ton of producing it varies widely. One man may grow it for as low as \$4 a ton; it may cost his neighbor \$8. What is the difference?

Two things are necessary to get cheap silage. It is essential to have a high yield per acre, and it is important to do it with as little work as possible.

To get a heavy yield, you should:

1. Choose the right variety for your section, which you can do either by checking to see what your most successful neighbors are growing or by inquiring of *American Agriculturist*, your County Agent, or state college of agriculture. One question you will have to decide for yourself is this: Do you want a big, succulent corn that will give you the most tons per acre without regard to ears, or do you want corn that will mature ears to the dough stage by average frost date in your section?

2. Make or have made a germination test. Most state seed laws require that seed exposed for sale be tagged to show the percentage of germination and the date the test was made. However you do it, be sure that the seed you put in will grow.

3. Use a crow repellent. This is particularly important if you have had trouble with crows or blackbirds in the past, but it is good insurance anyway. Some use tar; some use a commercial repellent. In either case, it adds little to the cost.

4. Do not plant the corn too thick. The man who takes a chance, who does not know the germination test of the corn, and who figures on planting one out of five for the crows, plants thicker than need be. If the germination is good and the crows stay away, the crop is too thick for best results.

You can get just about maximum yield by having a good corn plant every foot in the row. Thicker than that, the corn plants compete with each other and none attains full growth. By the way, better check the drill or planter for accuracy before you start planting.

5. Provide plant food. The natural fertility of some soil is higher than others, but you can help things along by a good application of farm manure plus superphosphate, or by using a complete fertilizer. One thing is sure, you cannot grow corn silage at a low cost per ton on land that will not grow a good crop, even with excellent care.

6. Weeds must be controlled. They not only must be controlled, but you must do it with the least possible labor. You cannot save much work on plowing or planting, and there are limits to what you can do on harvesting, but you can save time in controlling weeds. The best time to kill weeds is before you can see them and so far as possible before the corn is planted. Plowing some time before the crop is planted (in some sections plowing in the fall is common), then harrowing a number of times at intervals of a few days will not only put the seed bed into a friable condition, but will kill thousands of weed seeds that otherwise would compete with the corn. Then after the corn is planted, but before it comes up, frequent harrowings will continue the good work of weed control. You can go over a field with a spike tooth harrow or weeder before the corn is up in a fraction of the time it will take to go over it with a cultivator later. What you are really trying to do is to give the corn a head start over the weeds. If you can keep the weeds down until the corn gets knee high, you won't have to worry much after that.

Years ago a good farmer thought he was neglecting corn if he did not hoe it at least once. These days hoeing is too costly. Moreover it is unnecessary because careful following out of good cultivation practices makes it unnecessary. If, when next fall rolls around, you have a corn crop that will give you ten tons or better to the acre, you can be pretty sure, even though you haven't the figures, that the cost per ton is below average.

New Wrinkles for FRUIT GROWERS

HAILED as being more effective in controlling borers in peach trees than the standard materials now used, as being easier to apply and with less danger of injury to the tree, and above all as being less expensive, a chemical widely used in grain fumigation is now advocated for use by peach growers by Dr. D. M. Daniel, entomologist at the State Experiment Station at Geneva, N. Y.

The new material is an emulsion of a chemical known as ethylene dichloride and potash fish-oil soap diluted with water and applied directly to the tree regardless of age. It can be poured or sprayed about the base of the tree with equally good results, and can be applied at a time when other orchard work is not pressing. The last two weeks of April and the first week in May generally prove best for spring treatment, although the dates vary according to the season.

The new treatment is more effective in cool weather than in hot weather, and can therefore be used early in the season or later in the fall than can the old treatment with paradichlorobenzene which requires a soil temperature of 60 degrees or above to be effective. Ethylene dichloride emulsion has given excellent control in western New York when applied as late as the middle of November. It appears to be safer on young trees as well as more effective than the so-called "crystal ring" treatment with "P. D. B."

Detailed directions on the preparation and use of ethylene dichloride emulsion for the peach borer may be obtained upon request to the New York Experiment Station, Geneva, N. Y.

Go Slow on Plant Vitamins

Judging from the letters I've been getting lately, many amateur gardeners are interested in Vitamin B-1, largely on account of the newspaper advertising this material has had of late. Unfortunately, many of the claims made for the materials are exaggerations.

Vitamin B-1 is commercially extracted from urine. Its close relatives, known as growth promoting substances, are all products of plant growth and plant decay. B-1, for example, is plentiful in young plants. It is made in the leaves and later on transported to the roots. Under certain circumstances, and particularly when Vitamin B-1 is lacking in plants, they will thrive and grow much faster when it is added to the soil.

There is, however, a much cheaper way of applying B-1 than buying it in small bottles at the rate of \$1.00 per bottle. Some years ago a worker in Arizona was studying manure. He came to the conclusion that the benefit obtained from it, in addition to its content of nitrogen, phosphorus and potash, was almost entirely due to certain materials in the brownish liquids. These materials have since been identified as growth promoting substances. The easiest and best way for most of us to obtain Vitamin B-1 and other growth promoting substances is to apply manure or manure water, or even decaying peat.—*J. R. Hepler, New Hampshire College of Agriculture.*

According to recent report of U.S. D.A., over five million elm trees have been destroyed by state and Federal authorities in the Northeast in order to control Dutch Elm disease. Owing to this good work, the disease is said not to be spreading so rapidly.

FORD'S ALWAYS BEEN A GREAT FARM CAR BUT THIS FORD BEATS 'EM ALL!

It doesn't take you long to find out that in the 1940 Ford V-8,
you get the biggest money's worth so little money ever bought!

TRY THE RIDE! The surprising big-car ride that's one of 1940's big motoring events!

SEE THE ROOM! Extra knee-room, leg-room, head-room . . . you'll find a Ford surprisingly big inside . . . where bigness counts most!

FEEL THE POWER! The only 8-cylinder engine in any low-price car. Smooth, responsive power fewer cylinders don't give!

CHECK ON ECONOMY! The 85 h.p. Ford's 24.92 miles per gallon in the famous Gilmore-Yosemite economy test was best of all standard-equipped cars at its price!

COMPARE FEATURES! Biggest hydraulic brakes at low price! Semi-centrifugal clutch! Hardened valve seat inserts for all engine valves!

Come in today! Drive a Ford V-8 . . . before you choose any new car!

FORD V-8 A GREAT FARM CAR!

This year talk "Trade" with your Ford Dealer first!

Also Makes Most Perfect Concrete Silo for Corn

Possessing every perfected feature known to modern engineering, Marietta's 1940 Super-Construction Concrete Stave Silo is built **ESPECIALLY** for Hay—making also World's No. 1 Silo for Corn. No gamble with this proven, time-tested type of construction. . . . Every stave “drop-forged” of only washed and graded sand and gravel (No quarry refuse.) Safest investment against FIRE, STORM, severe climates, depreciation and content pressure. . . . Air-tight, refrigerator-type Redwood hinged doors. Special hooping, with patented wing spreader. Marietta's own metal dome roof—“It fits our silo.” Complete installation, by experienced erectors, and **GUARANTEED** to **ENDURE**. . . . Ask for **FREE** literature.

MARIETTA CONCRETE SILOS
Fire and Storm Proof — Lock-joint Concrete Staves — Air Tight Sealed Inside — Solid Redwood Doors — Built for Hay — Makes Most Perfect Silo for Corn.

Lavin Gerblis and the “air mail” calf.

An “AIR MAIL” Calf

ORDINARILY the birth of a Holstein calf is not a matter of national interest, but one born at the University of Nebraska, Lincoln, on February 4, 1940, is of vast significance to the entire livestock industry of the world. On that date a purebred cow in the University herd, Lavim Gerblis of U Neb, gave birth to a bouncing young son through artificial insemination from a bull owned by H. F. duPont, Winterthur Farms, Winterthur, Delaware, shipped 1500 miles to Lincoln by air mail.

While the technique of artificial insemination is not new, the long distance shipment of cattle semen is rare. A shipment made to the Argentine by the U. S. Department of Agriculture

was inseminated first at 1 P. M., using 1.8 c.c. of the fluid semen. She was treated again at 10 P. M. that night, and on May 5th was given a third injection.

Professor H. P. Davis, head of the Dairy Department of the University, states that originally the percentage of motility of the sperms was reported as 80 per cent and on examination upon arrival at Lincoln was down to 40 per cent. It had not decreased at the time of the inseminations. Temperature of the semen during shipment ranged from 40 to 60 degrees F.

Lavim Gerblis of U Neb, dam of the air mail calf, was second on the national Holstein Honor List in 1937 with a record of 859.7 lbs. of butterfat. She has produced a daily average of 54 lbs. of milk and over 2 lbs. of butterfat during her four yearly lactations.

The sire, Winterthur Posch Great Select, one of the young bulls in service at Winterthur Farms, is a son of the leading Honor List Sire (for siring the high producing cows) of 1936, for which Mr. duPont paid \$10,000 at a public sale in 1929. The dam of “Select” is one of the great producers of the Holstein breed, two of her records standing third in the United States in their respective age classifications. It seems likely, therefore, that the young bull born from this long distance mating should develop into a breeding animal of exceptionally high value.

Winterthur Posch Great Select, the calf's “long distance” sire.

was reported successful, but there appear to be doubts in the minds of many as to its true results. Shipments have been made successfully from England to Holland, and the reverse, that have brought about conception and calves. Recently a shipment was made across this country, but so far no offspring have been born.

It is believed that this calf represents the longest successful shipment of cattle semen anywhere in the world which has brought about conception and resulted in birth of a calf.

20 Hours From Bull to Cow

The semen was collected by means of an artificial vagina by Mr. William Reed, herdsman at Winterthur Farms, at about 5 P. M. the afternoon of May 3rd, 1939. It was carefully cooled, placed in a specially designed thermos bottle furnished by the American Dairy Cattle Club and put on the plane at Wilmington, Delaware, about 6 P. M. that afternoon.

The shipment arrived in Lincoln at noon on May 4th, 1939, and the cow

“I allus do my butcherin' on Saturday—that way I kill two birds with one stone.”

99 OUT OF EVERY 100 FARMER MEMBERS

Stood Firm!

... Others Are Re-Joining Every Day!

The Dairymen's League is a non-stock, non-profit organization of dairy farmers. It has two cornerstones. One is that it must be member managed and controlled. Two is that it must be member owned and financed.

In order to achieve those two ends in an orderly manner—and still give members the right to withdraw whenever they see fit—the period from February 12 to 28 of each year has been set aside as the “withdrawal period.”

True—a few members always withdraw. Just as a few men always change their politics every year. But that's only the working out of a healthy democratic system. Under the

constitution of the League, as under the Constitution of the United States, every farmer has a free and unhampered right to think and act for himself.

And yet today's membership figures show that fewer than 1 man out of every 100 withdrew from the League this year. Many of those who did withdraw have already been reinstated. Farmers stay in the League because they believe in the League . . . and because experience proves to them that the League protects their interests better than any other means they have been able to devise. It is their organization and they stand by it!

6 REASONS WHY THE DAIRYMEN'S LEAGUE is Going “Ever Forward”

1 MEMBERS REALIZE MORE THAN EVER THE TREMENDOUS POWER THE LEAGUE HAS WIELDED IN STABILIZING THE MARKET...

2 FARMERS EVERYWHERE ARE MORE CONSCIOUS OF THEIR UNITED POWER AND THEY DON'T WANT TO GIVE IT UP...

3 MEMBERS NOW KNOW THE VALUE OF A CONSTANT & STABLE MARKET FOR THEIR MILK...

4 EVERY MEMBER KNOWS HE WILL RECEIVE HIS CHECK EVERY MONTH

5 EVERY MEMBER KNOWS HE WILL BENEFIT FROM HONEST WEIGHTS & TESTS

6 THE LEAGUE STANDS FOUR-SQUARE FOR THE “AMERICAN WAY”... FOR THE ANCIENT RIGHTS OF ALL FARMERS, EXPRESSED IN THE WORDS “LIFE, LIBERTY & THE PURSUIT OF HAPPINESS”

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

from SKEFF'S NOTEBOOK

By L. B.
SKEFFINGTON

SUMMARIES of results of potato rotation experiments conducted by the State College of Agriculture emphasize the wide diversity of soil types to be found in New York. These experiments have been under way for four years at Ithaca and in Genesee, Steuben, and Franklin counties. Recently, results to date were reviewed by the college workers at the April meeting of the Central-Western New York Potato Improvement Committee.

While the research work will be continued, the committee now plans to prepare a progress report or summary on results to date to submit to its sponsor organizations, the State Farm Bureau Federation and the Empire State Potato Club, and to the Governor and Legislature.

Varying Rotations Studied

In Steuben County it was found that where potatoes have been grown every year in the same soil and received 12 tons of manure per acre plus commercial fertilizer, the yields have been higher than from any other rotations. The manure applications resulted in average increases in three years of from 68 to 88 bushels of U. S. 1 size over acreage without manure. No apparent benefits were indicated from seeding rye following a potato crop when it was plowed under the following spring for potatoes again.

Because many growers now are using two-year rotations, results with these are of interest. Potatoes, with rye cover followed by timothy and clover for green manure, produced highest yields. Next in order were potatoes with rye cover followed by corn for green manure and rye cover, and potatoes followed by dry shell beans with rye cover.

Results Vary

In Franklin County yields on many of the plots were somewhat similar to Steuben County, but Genesee County varied more widely from the other two. Some of the reasons are not yet known, but one of the factors apparently is the limestone soil. In attempting to explain some of the reasons, the college workers have been conducting numerous fertilizer experiments.

Discussion by committee members raised the question of whether the soil can be properly restored in two-year rotations. Another point raised was the effect of certain cover crops in drought years. It was indicated that structure of the organic matter in the soil may be more important than the amount of organic matter. Dr. Richard Bradford of the agronomy department said the trouble with many of the two-year rotations was too much tillage.

He mentioned how Lewis A. Toan, Perry grower, was working in this direction. Toan, said he, is planting rye following potatoes, combining the rye and leaving the straw. Some of the rye shattered, so that he also got a seeding, he said. He found this practice lessens puddling of the soil and a good mulch helps intake of water.

Saving Water

Dr. H. C. Thompson of the vegetable crops department said that coarse organic matter in the soil definitely increases its intake of water, as well as providing aeration. In Genesee County where corn was plowed under, it

was found potato roots were growing around the corn. Where soil contained less organic matter, or where it was too fine or compacted, the run-off of rainfall was greater.

Daniel Dean said that since 1918 he had been using the Maine rotation, two years of potatoes, one year of oats and one year of clover.

Considerable discussion centered around varieties. H. J. Evans said seed stock demand showed increasing popularity of Katahdins and Chippewas, with New York State definitely "going for round white potatoes."

Dr. E. V. Hardenburg reported 30 or 40 old and new varieties were being tested in 15 to 18 counties annually. These field tests enabled growers to study their behaviour, yield, disease-resistance, etc. He also said one of the needs of the industry was to reduce mechanical injury. Recommendations have shown how most of the mechanical injury on the farm may be reduced by minor changes in equipment at practically no cost to growers.

Prof. Donald Reddick told of efforts to develop a blight-immune potato. Last fall he thought he had a promising sort and planned to distribute a considerable amount for test plantings this year. The plant did well in a dry year and the tubers looked good, but now it is found they developed brown rot in storage. Thousands of plants have been grown since experiments were begun to combine the characteristics of a wild Mexican blight-free potato to the good qualities of the commercial types.

Most of the commercial types do not produce pollen, so the breeding job has been complicated. Some varieties do produce pollen, but not much else.

Cull Apple Question Debated

The Joint Fruit Committee of the State Farm Bureau Federation and the State Horticultural Society gave the cull apple question a workout, without taking action other than to commit it for further study. In principle, members of the committee and others attending the meeting found themselves not so far apart, but concerned with practical aspects of the situation.

One group proposed the committee ought to make recommendations about barring cull and low-grade apples from the fresh fruit market. Another group thought the situation might be handled satisfactorily by enforcement of present grade laws. One thought expressed was that because of low prices many farmers are forced to sell everything for which they can get any money. Whether this is short-sighted and results in a lowering of the whole price structure was another point.

While the question remains to be studied, a slant is something like this: Growers would like to see some regulation of culls and low-grade fruit which would permit them to sell them, if need be, and at the same time not compete with high-class fresh fruit. It is recognized there is or may be definite markets for considerable low-grade fruit. Growers feel that hasty action to bar a lot of this low-grade stuff might merely result in its being replaced in consuming markets by

an equal amount of low-grade oranges or other competing products.

Oppose Bewley Bill

The committee wired Governor Lehman requesting his veto of the Bewley bill which would appropriate \$10,000 for investigation of the apple industry by a joint legislative committee. The understood purpose of this probe by a legislative committee is to see what can be done by promoting apple sales, developing markets and levying a tax for advertising and promotion. The committee advised the Governor it felt itself competent to undertake such a study without cost to the state. It further suggested that the money might be used more satisfactorily for research purposes.

The committee is neither for nor against such a proposed tax, because it has not yet studied the matter.

The National Apple Institute selected me to tell its members "What Is Right with the Apple Industry." I liked the topic because I get so sick and tired of hearing so many negative-minded persons telling what is wrong with the apple industry and everything else. But in the interests of brevity I decided to hold down the number of "rights" to an even dozen, as follows:

1—The apple is known as the King of Fruits. It is backed by a wealth of sentiment and lore. It is the only fruit or vegetable which traditionally has a day or week dedicated to it over a wide part of the country.

2—The apple lends itself to eating, either raw or cooked. Probably there is no fruit or vegetable which can be prepared in so many ways.

3—The apple is famous as an aid to good health. The old adage about "an apple a day keeps the doctor away" may not be literally true, but it is worth a million dollars in advertising value.

4—Production of high-grade fruit per capita is by no means excessive. There is less than a bushel per capita even in years of high production.

5—About two-thirds of the apples are produced fairly close to centers of population. This gives growers great competitive advantage over products that are grown in distant areas, such as oranges, grapefruit, pineapples.

6—The apple is one of the few fruits or vegetables which is not increasing in production. A steady decline has been noted, largely as old trees and doubtful varieties are removed.

7—Apple production has become a specialized business, with the advantage that acreage cannot be stepped up from year to year as with annual crops.

8—The marketing season for apples is being lengthened. The apple is not highly perishable, like the peach or strawberry. Current research indicates we will be able to hold apples on the trees longer to develop higher quality and then keep them better in storage for longer periods.

9—Increasing attention is being given to utilizing inferior grades of fruit in by-products, so as to keep them off the fresh fruit market.

10—The trade, dietitians, and the public seem receptive to apple promotion. Some growers are beginning to realize they must take a more active part in merchandising their product, because in that direction lies solution of many of their problems.

11—Enough has been done to show that distribution, prices, and net returns may be improved by advertising, salesmanship, and trade promotion.

12—The apple industry is beginning to appreciate the value of education and self-help to solve its problem. It has been a hard lesson to learn, and I am sorry to say it has not yet been fully absorbed, but the cold fact is that the apple grower must do for himself what no one else will do for him.

There are a lot of other "rights" I might add about the apple industry,

98 Per Cent for Milk Amendments

The vote on the amendments of the Federal-State Milk Marketing Order for the New York City milk shed, has been announced as follows: 36,942 ballots were counted. Of these 36,371 were "yes" and 571 were "no". Cooperative associations qualified to vote for their members cast 29,830 votes for the amendments and 164 against. Individuals who voted cast 6,541 ballots for the amendments and 407 against.

The amendments, designed to prevent a serious drop in prices to producers for May and succeeding months, will doubtless become effective May 1, although at this writing no definite date has been set.

but enough have been listed here to indicate the opportunities that lie within the grasp of the industry. There are some things I have not mentioned, notably surplus purchases by the government. I can hardly conceive that it is a right state of affairs for growers to have to go begging to the government to buy their apples for 85 cents a bushel. This is especially true when almost any day one may see so much "junk" rotting in stores and discouraging the public from buying apples.

Personally, I believe an excellent emergency job has been done in handling surplus purchases. Probably the need will remain until something happens to raise the general price level.

I know it is hard to start self-help programs in times of depressed prices. But the point is that when everything is booming you don't need them. Any kind of a self-help or educational process is slow in getting started. Results must be cumulative rather than spectacular. I am convinced that because such organizations as the Apple Institute have been able to stay in business and pay their bills, despite low prices, this self-help process is taking form.

I believe that what the apple industry needs is faith in its ability to go forward, and an action program that will enable it to go forward. I don't think the problem is too great, if there is organized cooperation. I think the job is tough because there is too little cooperation—too many free riders who want to share all the benefits without giving any help.

Your problem, as I see it, is not so much selling apples as it is to sell your own people to participating in and supporting a sound program.

The Veterans of Foreign Wars are holding their usual sale of Buddy Poppies Memorial Day. These are made by disabled American soldiers, and the money received for them is used for aid of these men.

Did the Depression Reduce Consumption of Dairy Products?

By LELAND SPENCER

WHENEVER we run into a tailspin of deflation and unemployment, consumers have to cut down on what they spend for nearly everything. The worst deflation of prices this country has ever had began in 1929. The estimated earnings of industrial workers were less than half as much in 1932 as in 1929.

It is interesting to see what happened to the sales and consumption of dairy products under these conditions.

In the low year of the depression, American consumers spent about 60 per cent as much per capita for dairy products as in 1929. The reduced expenditures were entirely due to lower prices paid, as there was no significant change in the milk equivalent of all products purchased.

The deflation had very different effects upon the consumption and prices of the several products. This is shown in the accompanying table. For example, consumers reduced their purchases of fluid milk about 12 per cent, but increased their use of evaporated milk by 11 per cent. Ice cream suffered the greatest loss of consumption, about 45 per cent. It will come as a

surprise to many that the consumption of oleo was reduced sharply during the depression, while the consumption of butter actually increased a little.

CHANGES IN CONSUMPTION AND PRICES OF DAIRY PRODUCTS AND OLEOMARGARINE IN THE UNITED STATES DURING THE PERIOD OF DEFLATION AND DEPRESSION, 1929-1934

Product	Year of smallest consumption per capita	Change in consumption from 1929	Decline in retail price for same period	Decrease in consumer expenditure per capita for same period
Fluid milk	1934	-12%	20%	29%
Evaporated milk	1933	+11	33	26
Butter	1933	+3	50	49
Cheese	1932	-5	39	43
Ice cream	1933	-45	17*	54
Oleo	1932	-44	44	69

*Estimated.

Probably the main reason that butter consumption was maintained so well during the depression is that retail prices of butter were drastically reduced. Free distribution of butter by government and local welfare agencies helped, but low prices were the main factor in holding up consumption. In 1933, retail prices of butter averaged only 27 cents a pound, or one-half the 1929 price. On the other hand, retail prices of fluid milk were reduced only 20 per cent, and ice cream even less.

These facts suggest that it is of great importance to dairymen, first, to restore and maintain a high level of industrial prosperity in the United States; and second, to keep the prices of fluid milk at a fair level in comparison with the price of evaporated milk and other foods.

The Milk Price for April

THE uniform or blended price to milk producers in the New York Milk Shed for the Month of April was recently announced by Administrator Harmon as \$1.92 a hundred. The price is for 3.5 milk in the 201-210 mile zone. It is 18c less than the February price.

There are three reasons for the decline. First, the price of most manufactured products under which surplus milk goes dropped during March in amounts varying from 4c a hundred for milk used for butter to 14c a hundred for milk used for cheese. Second is the increased milk production. Approximately 44.2 per cent of the milk delivered during March was used as fluid milk, compared with 50.5 per cent during February. For March the amount of milk on which the price was computed was 475,405,106 lbs., while February production was 388,545,532, representing an increase of nearly two million pounds a day. The third reason is the drop in Class II-A milk from \$2.05 to \$1.90. During March about 60,000 producers delivered milk to 491 plants approved for the Metropolitan area.

Class prices on which the March uniform price was figured are as follows: Class I (fluid milk), \$2.82; Class II-A (fluid cream), \$1.90; Class II-B, \$1.828; Class III-A, \$1.428; Class III-B, \$1.534; Class III-C, \$1.134; Class III-D, \$1.109; Class IV-A, \$1.034; and Class IV-B, \$1.076.

Amendments Generally Approved

Recent meetings of dairymen indicate general approval of the amendments expected to go into effect on May 1. General opinion is that amendments improve the order in spite of the fact that some things were included for which dairymen did not specifically ask and some things for which they asked were omitted. Among the latter was a provision that dealers should pay into the equalization fund on a weekly basis rather than once a month. As you remember, the amendments set a minimum Class 1 price of

\$2.45 for May, June and July; and a minimum Class I price of \$2.65 for November and December. These prices are designed to put a floor under the price structure.

There is considerable sentiment among producers that a move should be started to secure an amendment also to set a minimum price for Class I milk for the months of August, September and October. On the other hand, there are some dairymen who feel that it would not be wise to attempt to get further amendments at this time.

An Interesting Experiment

The New Bedford Milk Producers' Association, New Bedford, Massachusetts, has decided that it can maintain a stable market without federal aid. For six years New Bedford has had a federal marketing agreement which has been successful. The terms of the agreement are to be continued without federal assistance.

This development will be watched with interest, in view of the strong feeling in the New York Milk Shed that government assistance in maintaining a stable milk market should be temporary and that eventually dairymen should become well enough organized to handle the situation.

Milk Prices in Other Markets

During the month of April several city markets in eastern states reported declines in the prices of Class I milk, ranging from 14c to 30c a hundred. In Buffalo the Class I price was reduced 35c a hundred, with retail prices unchanged. In Pittsburgh and McKeesport markets in Pennsylvania the Class I price was lowered 30c a hundred, and the retail price went down a cent a quart. On March 18 Class I price in Cleveland was reduced 30c, and retail price was reduced 1c a quart. Only market to show increase during April was Baltimore where milk delivered at homes went up 1c a quart. Increase marked a more stable adjustment of prices following unsettled conditions.

A CRAWLER TRACTOR

DELIVERED AT YOUR FARM

FOR

\$965

CLETRAC MODEL HG

20 H. P. on Belt 2-3 Plow Power on Draw Bar

42 in. Tread, 6 in. Track . . \$965.00

68 in. Tread, 6 in. Track . . \$985.00

42 in. Tread, 10 in. Track . . \$995.00

Here is a tractor that asks no favors. You can plow under adverse conditions. You can plant, cultivate and harvest on time. You can run a mill or feed grinder; you can saw wood; you can pull stumps; you can dig ditches and do other miscellaneous work — whenever you want.

IT PLOWS — 2-3 plow capacity for any soil.

IT PLANTS — Accurate steering, positive traction mean straight, uniform rows.

IT CULTIVATES — With "full view" mounted cultivator for all row crop cultivation.

IT MOWS — "Full view" mower has cutter bar ahead of tractor.

The General "Full View"

The New Low-priced rubber tired wheel tractor that does ALL farm work. Delivered on your farm \$650.

1-2 PLOW, 2-row planting, 2-4 row cultivating

The General "Full View" tractor is the wheel tractor that thousands of farmers have sought—a 1-2 plow tractor that plants two rows; cultivates two, four or six rows; that mows a six foot swath; runs the average sprayer or duster; saws wood and does hauling. It is a general purpose tractor of the best construction and at a price to fit your pocket book. The General meets the demands of "one team" farmers yet will handle large acreage as well—and do both jobs efficiently.

TRY the "Cletrac" or the "General" on Your own farm —under your own conditions.

■ Farm Leaders Oppose Chain Store Tax

HEARINGS of vital interest to farmers are being held this month in Washington by a subcommittee of House Ways and Means Committee. Under consideration is Patman chain store tax bill which would impose excessive taxes on chain stores and force the breaking up of largest chain systems.

Several farm leaders from various sections of United States spoke vigorously against this tax bill, arguing that it would penalize efficiency in distribution and cut consumption of farm produce. John Rice, representing Massachusetts Fruit Growers Ass'n., said that enactment of Patman bill would completely disorganize fruit growing industry. He pointed to good work of chains in helping New England apple growers to move their apples following 1938 hurricane, which felled thousands of New England apple trees and made quick handling of crop imperative. Apple selling campaign which Great Atlantic and Pacific Tea Company and other chain groups put on at that time, he declared, saved many a farmer from bankruptcy.

Another speaker against the bill was American Farm Bureau Federation President, Edward O'Neal. He testified that in recent years chains have cooperated with farmers very effectively in purchase and sale of surplus farm commodities, and made possible the consumption of large quantities of farm commodities which otherwise might rot in the fields. In addition to farmers' interest as producers in chains, Mr. O'Neal said that they have a further interest in them as consumers who are anxious to retain the savings made possible through chain store purchases.

Mr. O'Neal concluded his testimony by saying that the Farm Bureau believes each type of distributor—the independent, the chain and the cooperative—should be given an open field limited only to fair competition, and that "any sound legitimate way of distributing goods to consumers at lower costs should be encouraged instead of penalized."

It's THRIFTY to be a CAREFUL DRIVER

New York State rates for automobile insurance, based on driving records and use of car, are lower than in many years. New York State motorists have never received less than 20% annual dividend with Utica Mutual. Combine the two, and you'll agree that, "It's Thrifty to be a Careful Driver."

■ Cotton Stamp Plan To Get First Test

COTTON STAMPS, as well as food stamps, are soon to be made available to relief families in a few cities. First to get them will be Memphis, Tennessee, one of largest cotton markets in United States.

Purpose of both food and cotton stamp programs is to help move farm surpluses, and at same time enable needy families to be better clothed and fed. Food stamp plan, now in operation in 30 cities, is said to be very successful in increasing consumption of fruits, vegetables, and other foods which are from time to time listed by Department of Agriculture as "surplus" foods.

Cotton stamps to be sold by government to Memphis relief families will permit them to buy twice as much in way of cotton goods as formerly, without it costing any more than they have been in habit of spending. Retail dry-goods stores will take the stamps in trade only for cotton goods which have been made entirely in United States and from cotton produced here.

■ U. S. Acts To Guard Neutrality

AT THREE o'clock in the morning, April 9, a telephone message from Washington brought to President Roosevelt at his Hyde Park country home the shocking news of Germany's swift invasion of democracies of Denmark and Norway. Following day, President hurried to Washington and acted with Secretary of State Hull to take steps to safeguard United States' neutrality.

Under Neutrality Act, President shut off further American travel and shipping to and from Scandinavia and Northern Russia. Money and credits in this country belonging to Norway and Denmark were placed under government control, to prevent their use by Germany. Also, government loans scheduled for Norway, Sweden, and Denmark have been held up.

Living in Scandinavia are 3,371 Americans, who have been informed that government will aid them to quit new war area as soon as possible. Those who can afford to pay their way home will be expected to do so. Those who can't will be aided by special fund created for the purpose by Congress.

Germany's ruthless seizure of Norway and Denmark brings Europe's war closer to United States because of nearness of Danish colony, Greenland, to America. Island is only 300 miles from Canada and 1,300 miles from United States. Should Germany ever try to occupy Greenland as well as the mother country, Denmark, question arises whether United States would feel that its own defense and Monroe Doctrine were involved.

Although northern Greenland was discovered by Peary, United States gave up its claim to it when we bought Virgin Islands from Denmark in 1916. Greenland has an area of 736,518 square miles, but all except about 31,000 square miles is ice capped. Population numbers only 17,000, of whom 400 are Danes and the rest Eskimos.

SLANT: In formal statement issued last week, President condemned Germany's attack upon peaceful Denmark

and Norway and declared that if civilization is to survive, "powerful neighbors must respect the independence of small nations." As long as a great country like Germany is ruled by a gangster government, no nation is safe. America must keep out of this futile Old World struggle at all cost, but we must at same time prepare to take care of ourselves should our own freedom be threatened. In view of events abroad, there seems no doubt that our surest road to peace is to have an adequate defense program.

■ \$28,000,000 a Day

WHEN FIGURES get into billion class, it is hard to make them mean much to those of us who think in terms of pennies and hundreds of dollars, so here are some that will make your head swim, as they did ours:

From July 1 to Dec. 31 of this year, Federal Government is expected to spend \$5,000,000,000, an average of \$28,000,000 a day. This is \$3,000,000 a day more than the British are now spending on their war.

Four years ago, when another presidential election was on the calendar, Federal government spent \$4,400,000,000, but that sum included a big chunk of cash for soldiers' bonus. This year there is no soldiers' bonus for an excuse, but Federal Government spending will beat 1936 figure by several hundred million. Checks will flow latter this year to large and growing groups of our population, including 2,000,000 WPA workers, 1,500,000 old

people, and 4,000,000 farmers.

Millions of voters, nearly one-third of them, now have a stake in government spending.

■ Farm Credit Battle Continues

YOU CAN'T MIX farm credit and relief in the same institution, said Frank E. Boice, of American National Livestock Association, who took up the cudgels for an independent Farm Credit Administration at a hearing held this month by House Committee on Agriculture.

"It is so easy to extend relief by easing up on collections that we are convinced that the department of agriculture will not long resist the temptation to grant relief through a credit institution which it controls," and when that happens, added Mr. Boice, it inevitably becomes all relief.

Wheeler-Jones bill, which has been subject of hearings for a month, has been called a brazen attempt to destroy farmer-controlled cooperative credit, and to use soft farm credit to farmers as a political bait. A. S. Goss, Land Bank Commissioner who was forced out of Farm Credit Administration after Secretary Wallace decided to manage FCA, has described Wheeler-Jones bill as a "complete abandonment of the principle of a farm-owned cooperative credit system in favor of straight government lending, with a widespread operating organization entirely under the control and domination of one man located in Washington. The political possibilities of such an organization

WAR SPREADS.—This map shows scene of new theatre of war, following Nazi Germany's ruthless seizure of Denmark and Norway on April 9. Fate of Norway still hangs in the balance while Britain and France fight along with Norway to push back the Germans.

are practically unlimited."

Secretary Wallace recently announced that he is preparing to "take to the country" his side of the Farm Credit argument, claiming that opponents of his program have "misrepresented" policies adopted by FCA since President Roosevelt turned the agency over to Department of Agriculture last July.

Secretary Wallace did not mention by name his opponents, but farmers know that his opponents include practically all of the major farm organizations, including the National Grange, the American Farm Bureau Federation, and the National Council of Cooperatives, to which belong most of the successful farmers' cooperatives in this country. All of these organizations are bitterly opposed to Wheeler-Jones bill, and are fighting for passage of the Gillette-Kleberg bill which aims to restore FCA to independent status under a bi-partisan board.

War Spurs New Uses For Farm Products

EUROPE'S WAR is doing one good thing for American farmers. By shutting off imports of certain supplies we get from Europe, it has put more steam behind drive to find new uses for farm products in industry.

Recent new developments were announced at meeting of Sixth Annual Chemurgic Conference held last month in Chicago, where more than 250 new industrial products, which can or have been made from farm products, were discussed. Among these were starches such as arrowroot, which waxy corn and starch sweet potatoes can supply; fibers like jute, which may be replaced in part by hemp; drying oils like tung and perilla, for which dehydrated castor oil can be substituted; and a non-crystallizing corn syrup that is replacing cane sugar in many uses and building up new uses of its own. Other substitutes developed from corn and exhibited at meeting included plastic buttons, paper, wallboard, varnish, and cloth.

Cotton was there with its share of new offspring, including the new cotton stockings, cotton plastic spoons, and an icecream made from cottonseed meal and lint extract. This icecream is said to be highly nutritious as well as good to the taste.

Minnesota and California flax growers are happy about the development of a new United States made cigarette paper which will use the flax from 100,000 acres this year. Before the war, practically all cigarette paper had to be imported from France and Italy.

Government now has four great regional laboratories under construction to aid in finding new uses for farm products. Congress has appropriated over seven million dollars in the past two years and next year will add another three million. Laboratories are to be located in Philadelphia, Peoria, San Francisco, and New Orleans. Each will have a staff of 250 persons eventually, and a program of research which it is hoped and confidently expected will do much during the next ten years to solve the problem of surplus farm crops.

SLANT: Education and research like the above are best answers to farm and other problems.

Co-Ops. Help Woodlot Owners

IF YOU want more money from your woodlot, join or organize a woodlot marketing cooperative, advises James D. Pond of Cornell University forestry department.

Such co-ops, says Mr. Pond, promote

careful cutting in woodlots, so that owner has continuous income from faster growth on higher quality trees; they work to get a higher income for members through sales of larger logs and quality timber, better markets, accurate scaling of logs and measurement of other products, and the opening up of new markets. They keep accounts for their members, give work to local people, and often result in establishment of new local woodworking industries or reviving of an old one.

Pointing to Tioga Woodland Owners' Cooperative, at Owego, N. Y., as a successful example, Mr. Pond states that it expects to cut about half-a-million board feet of logs this year.

New Hog Cholera Vaccine

UNIVERSITY of California has announced a new hog cholera vaccine which it says will prevent loss of millions of dollars worth of swine every year. It differs from other vaccines

which have been in common use in that it does not produce the disease, and therefore does away with possibility of newly vaccinated pigs spreading the infection to hogs which have not been inoculated.

Credit for the new preparation goes to Dr. William H. Boynton and Gladys M. Woods of veterinary science division of University of California, and to Dr. F. W. Wood of Cutter laboratories. Announcement states that the new vaccine has been made available to all veterinarians in United States.

Good Books to Read

TO THE END OF THE WORLD, Helen C. White. From boyhood, Michel de la Tour d'Auvergne loved the Abbey of Cluny, and dreamed that in his own generation, as in the Middle Ages, it might again reawaken the spiritual life of France. But when he gets to Cluny he discovers that in the turbulent conditions of his day his dream cannot be realized. He turns from role to role, trying the life of a parish priest in a small fishing village,

till the peasant feeling proves too strong; going to Paris to face the Revolution and help as opportunity offers; devoting himself to a hidden ministry in the mountains of Auvergne. The whole story glows with rich pageantry.—*The Macmillan Company, New York. \$2.50.*

Good Movies to See

REBECCA. A bleak old manor on the rocky coast of Cornwall fired the imagination of Daphne du Maurier, and against this gloomy pile she concocted an ingenious melodrama, which has now been transferred to the screen. Although the story is told by a girl whose name is never mentioned, the real heroine is the flaming, sinister Rebecca, who long after her death continues to dominate the lives of those she touched, turning their happiness to bitter sorrow. Laurence Olivier plays the part of Max De Winter, Joan Fontaine the shy second wife.

THE BLUE BIRD. Fantasy of happiness and its attainment, based on Maeterlinck's well-known play. Shirley Temple as Mytyl. Fine music. Good family entertainment. Technicolor.

Play Safe. Choose a Genuine FARMALL

Nearly 500,000 FARMALLS delivered to farmers—that's the solid foundation on which we've built today's great new line of FARMALLS. At right: the 2-plow FARMALL-H with Hi-Speed Cultivator. This model has 5-speed transmission—up to 16 miles an hour on rubber.

NEW comfort, new speed, new power, new beauty, and new economy are all yours when you choose a new FARMALL. These zippy beauties are genuine FARMALLS, through and through, built on a solid foundation of success earned in 17 years of all-purpose tractor pioneering. During those 17 years the whole tractor farming system was transformed. FARMALL design did it. It led the way, and it leads the parade today. You get all the advantages of genuine Farmall design in any of the four new FARMALLS.

A new tractor is a lot of fun; and it's the life-blood of your farm. Choose the right trac-

tor partner to help you win. Be sure you get the benefits of FARMALL experience.

In this busy season, each day proves the value of FARMALL balanced power and equipment. Visit the International Harvester dealer and ask him about the four new FARMALL sizes and the efficient machines that work with them. Pick power and machine to fit your farm. Insist on FARMALL quality, comfort, and economy. Remember, the farmer's proudest boast, "I OWN A FARMALL."

By J. F. (DOC.) ROBERTS

THE value of various State Agricul-
tural College experiments, exten-
sion services, and just practical live-
stock feeding is perfectly demon-
strated by the western lamb feeding project
at Ithaca, N. Y., this season. These
lambs, fed under the direction of Dr.
John Willman, were part of a band of
about 4,000 lambs which I bought in
New Mexico, most of the balance go-
ing to other New York State Farmers.
They were fed no differently and hand-
led under no better conditions than al-
most any of our feeders could handle
them, yet here are the results.

They gained better than three-tenths
of a pound a day or about a pound
every three days on feed. This is 20 or
30% better than the average feeder is
doing. They brought on the Buffalo
market 25c a hundred more than any
other State lambs sold that day. They
dressed, for the packers that bought
them, almost four pounds more of edi-
ble meat per hundred pounds live
weight than average, and cost the
packer 53c a hundred weight less, live
basis, than average New York State
fed lambs cost them.

This means that just on the hundred
thousand Western lambs fed in New
York State, the farmer should and
could be getting over forty thousand
dollars more every year than he is get-
ting.

Export of food products of all kinds
has fallen off in the last few months,
but developments of the past few days
in Europe would indicate again that no
early peace is in sight, that we are in
for a long war. This will have a tre-
mendous influence on all our plans,
probably affecting agriculture more
next Spring than it will this Summer
or Fall. Therefore, I believe plans
should be long term rather than short.
This places livestock directly in the
picture: a flock of ewes for long term
production, light feeding cattle, a few
sows (they are sure cheap now), and
horses. This means barns full of fodder
of all kinds this Fall, and plans to con-
tinue to fill them each Fall for at least
the next few years.

This seems to be a war of and for
gasoline and oil. If the situation ever
gets around to where our supply of
these products is available to either
the warring or neutral countries, no
one knows how much farm power will
cost. Horses are still cheap—too cheap.

Hill Country Sheep Production

George L. Brown, Secretary of the
committee and purchasing agent of
Kenwood Mills, Albany, New York.

In addition there is an advisory com-
mittee consisting of F. H. Eldridge,
Harry Eldridge and W. S. Wooster, all
members of the Albany firm; E. H.
Thomson, president of the Federal
Land Bank, Springfield, Massachusetts;
Dr. J. F. Roberts, sheep salesman for
the Producer's Cooperative Commission
Association, Buffalo; and S. B. Whit-
aker, secretary of the New York State
Sheep Growers' Cooperative Associa-
tion, Penn Yan.

A large percentage of the flocks in
New York State are found on the bet-
ter farms. It is fortunate that the
Kenwood Sheep Farm has been estab-
lished to learn something about the
advisability of raising larger than av-
erage flocks on such submarginal or
abandoned hilly farms. Since detailed
records are being kept, much valuable
information on both sheep and crop
production will be obtained. Plans are
being made to hold a sheep field day at
the farm some time during the summer.

* John Willman is a member of the staff
of the Department of Animal Husbandry,
New York State College of Agriculture.

Horses affected with BOWEL
CATARRH, minor KIDNEY or LIVER
disturbance require more grain . . . can
do less work. Dr. Naylor's Tonic For
Horses is an effective aid in correcting
these conditions.

NEARBY MARKETS for NEARBY POULTRYMEN

A Silver Lining

Eat Eggs—Talk Eggs—Sell Eggs

By J. C. HUTTAR

SOMEbody once said, "It's always darkest before the dawn." I must confess that I don't get up before day-break often enough to know this from experience. When I do I'm too sleepy to try to figure out how dark it is.

J. C. Huttar

Anyway, it reminds me of the poultry situation right now.

Things, haven't looked so good in the chicken business. Here I am spending just about all my time buying eggs for the United States Government in New York City. I bought 140,000 cases in the month of March and the Federal Surplus

Commodities Corporation had other agents buying that many more in other parts of the country.

This means two things to me. Firstly, if the government hadn't bought these eggs, prices would have dropped quite a bit lower. And, secondly, before the government buying is finished it should take more than a half million cases of eggs off the market and out of the way. These would otherwise go into storage warehouses and be brought out for sale next fall.

In spite of this buying, egg prices have been lower than in the winter and spring of 1939. This together with higher feed prices has taken a lot of the joy out of egg production.

So it has been dark for the poultryman the last few months. The only question now is, "Will there be a dawn? And, if so, how soon?"

The Gray Streaks

I may be mistaken, but I think I see some gray streaks in the eastern sky.

For one thing, I see by all reports that the marketing of old hens from last fall to date was heavier than common. This has apparently reduced the total number of layers in the country nearly down to a level with a year ago, when egg production wasn't too heavy.

Then, if you have come across the hatching reports which the federal government publishes monthly, you already know that chick hatchings and sales are from 1/4 to 1/2 below last year and even below 1938.

I don't expect hatchings to continue to run so low for the whole season. In fact the preliminary report for April first shows only an 8% decrease in orders for baby chicks to be delivered after that date. But still the total hatch is bound to be well below last year and possibly as small as 1938. In that year the hatch was not big enough to give us a distressed marketing problem.

The other ray of light which I see is in the cold storage picture.

I just got the Government report for April first. It showed the total storage holdings of eggs, unbroken and in the shell, to be 250,000 cases less than on April first last year and 375,000 less than the past five years average for that date. This means a drop of 23% from last year and 30% from the five year average.

Besides the unbroken, or shell, eggs in storage one has to watch the storage of eggs in cans too. This means

eggs which were broken out of the shell and either separated into yolks and whites before canning and freezing or put in unseparated. These frozen eggs go to bakeries, ice cream plants and candy manufacturers, who use them the year round. They are mostly canned in the spring and put in storage. They are used every month in the year. They make up quite a bit of the total production of eggs. A case of eggs will average to yield nearly 40 pounds of this canned product.

Now if we take the total of the canned or frozen eggs in storage and add it to the shell eggs we'll find that the total holdings are now 750,000 cases below last year and 800,000 cases under the past five years average.

While there is still lots of time left to store eggs this year it begins to look like fewer eggs will be put away to compete with fresh egg prices the last half of this year.

Too Many Losses

Spring prices depend quite a bit on the man who finances the storage eggs.

In the last 25 years there have been two years that storage eggs have lost money for their owners for every one when they've shown a profit. Last year was a particularly bad year.

So the speculators and storers are getting poorer and more cautious. That's why the surplus eggs have so few friends this spring.

I guess it is a good thing the Government is buying some of these surplus eggs and giving them to folks who would normally eat very few if any eggs. This gets them out of the way.

The Big Problem

The answer to all these tough times in the chicken business still lies (as Editor Ed pointed out a month ago) in getting folks to eat more eggs than they do.

Every poultryman with 200 hens or more, every poultry breeder and hatcheryman, every feed dealer and manufacturer and every maker and dealer in poultry equipment has to realize this before it can be corrected.

We all have to eat eggs, talk eggs and sell eggs to other folks. To keep you reminded of it, I'm heading my column with this statement—

EAT EGGS—TALK EGGS—SELL EGGS!

Eat More Eggs

I cannot tell you how deeply I appreciate the fine issue of March 16 and all that it has done in the interest of fresh eggs. As an officer of one of the organizations which was instrumental in getting the spring egg festival started in conjunction with the Associated Food Chains and Independent Stores, I cannot help expressing my deep appreciation for the wonderful issue that you have devoted so fully to egg consumption. I believe that in the whole country *American Agriculturist* ranks first in the spring egg drive on the matter of publicity. I certainly congratulate you and thank you for so urgently taking up the cause of our poultry people.—L. Harris Hiscock, President of International Baby Chick Association, Skaneateles, N. Y.

Your article "How Can I Stay in the Poultry Business" which appeared in the March 16 issue of *American Agriculturist* is a plain statement of (Continued on Page 19)

Say you saw it in AMERICAN AGRICULTURIST.

Raising Baby Chicks

A brooder house all ready for the chicks. The fire has been going for three days, and the thermometer at the edge of the hover registers 90°. The floor is covered with a thin layer of ground corn cobs, which this poultryman has found very satisfactory.

In each corner is some straw to keep the chicks from crowding. On this farm this method is preferred. When the chicks get to the corners, they may work up the hill of straw gradually, but it is rather slippery and it prevents their congregating in the corners.

On the floor are several clean egg flats that have not been used for shipping eggs. These are covered with mash.

Putting baby chicks in a brooder house. Drinking fountains have just been disinfected with a coal tar disinfectant, rinsed thoroughly, and filled with lukewarm water. This is an important step sometimes overlooked. A day-old chick can be very easily chilled by drinking cold water.

In this house, measuring 8 by 14 feet, there are 300 chicks, which is about the maximum that this poultryman feels should be put in one house. The program here differs from that commonly followed in one respect in that no fence is used to keep the chicks close to the heat. The house is warm, and no trouble has been experienced because of wandering away from the stove.

In a day or two several chick hoppers will be placed in the space between the hover and the door. Fountains the size of those shown in the picture are left about a week. Then larger ones are substituted. These fountains are washed daily and disinfected thoroughly once a week.

Another brooder house on the same farm, showing chicks well started on the way to becoming profitable producers. The feed hoppers shown here replace the smaller type as soon as the chicks are large enough to use them.

Chickens Can't Read!

—but they can tell you unmistakably whether their feed contains *milk* and enough of it for real milk *results*. Chickens can't read the printing on the tag or on the bag—what's *in* the bag is what counts!

Lack of enough milk in the breeder mash has been responsible for much of the trouble with poor hatchability this season—a high price to pay for false economy.

Curly toe paralysis in young chicks has been troublesome this year—the result, in too many cases, of the lack of enough milk in the starting mash.

No real substitute has yet been found for all the known and yet-unknown nutrients of dry skim milk. The careful feed maker is not satisfied with makeshifts. He uses high grade dry skim milk—7½ to 10% in chick starter and in breeder mash—5% in egg mash and growing mash.

Insist on dry skim milk in your feeds and *enough* to do the job. Remember, there is no substitute!

Stick to the Rules and Avoid Trouble

By DONALD RUSHMORE

IF YOU ARE starting a poultry farm and using your head, that is, using information obtainable from your Farm Bureau, farm paper or State College of Agriculture, you will, in all probability, have excellent results for the first couple of years. Beginner's luck, you may call it, but actually it will be due to various causes. If you are starting on a farm where no poultry has been kept before, you will be free from disease on the place; being ignorant of methods of rearing and managing chickens yourself you will get reliable books and follow instructions carefully; you will, of course, have purchased your baby chicks from a hatcheryman who has a disease-free breeding flock and who has bred for high production and livability. You will be highly enthusiastic about poultry and consider yourself quite an authority after a year or two.

A Confession

About then you will begin to see ways in which the books, bulletins and County Agricultural Agents are wrong and you'll set out to improve their recommendations. While you're breaking away from the "book of rules" which you've followed so strictly—and successfully—have your eye peeled for a new job, because you stand a good chance of going broke within a year or so. I know! I just missed it by the skin of my teeth. It is in the hope that I can steer others away from the pitfalls into which I fell that I am writing this.

We can skip the first year or two, when you're following instructions of specialists. About then you will decide that, if your 500 hens have made you a profit of \$500 to \$750 over their feed cost, 1000 will make \$1000 to \$1500. You will, of course, need more laying quarters and you will build them, but you started 250 chicks in each 10x12 brooder house for two years and they seemed to have lots of room around the hover so you'll just try 350 this year. This will enable you to get by with only one additional house.

During the course of raising your chicks under more crowded conditions they may or may not show any ill effects. They may reach maturity looking just as healthy as in the past—but when you put them in the laying house—ouch! You suddenly find yourself with 1000 savage cannibals on your hands, and if you don't lose a third of your flock before you get them cured you'll be lucky.

Or they may not even look good to you by the time they are six to eight weeks old. You dodged coccidiosis for two years when the chicks were not crowded but now you have it in the flock—not acute, perhaps, but duodenal coccidiosis, which will kill hundreds of your birds after they reach maturity and weaken the whole flock.

Give Them Room

All of this because you've decided that after two years you know more than men who have spent their entire lives studying poultry. Think how much wiser it would have been to have studied your first two years' records, then, in expanding, follow identical

methods in every way, even if it required so much building that you had to cut down on the number of hens you expected to keep in order to give the baby chicks a better chance.

I am starting my fifth year in poultry raising and I am going into it with the "book of rules" in my mind at all times. I have spent two years learning by experience what I hope any beginner who happens to read this will learn from me. Crowd your family if you must but DON'T crowd your chicks!

Danger of Infection Among Baby Chicks

Success in raising baby chicks largely depends upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Use preventive methods. Give Walko Tablets in all drinking water from the time chicks are out of the shell and you won't lose one where you have lost dozens.

Remarkable Success Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I tried Walko Tablets. I used two 50c boxes, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens were larger and healthier than ever before."—Mrs. C. M. Bradshaw, Diagonal, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

Sales Service

Livestock breeders who are subscribers of A.A. have a special and distinctive sales service at their command, NORTHEAST MARKETS FOR NORTHEAST PRODUCERS. It is made available to readers of A.A. in an effort to open markets for surplus that otherwise may have to be sacrificed. For details and rates, write the Advertising Dept. of American Agriculturist, Savings Bank Bldg., Ithaca, N. Y.

TIME WELL SPENT

Time taken to read the advertisements in AMERICAN AGRICULTURIST is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad", be sure to mention the name of

AMERICAN AGRICULTURIST

Fred Bush, R. I, High Falls, N. Y.

Eat More Eggs

(Continued from Page 16)
facts which should arouse our industry to support vigorously any campaign designed to increase demand for eggs and poultry meats. I want to commend you for taking this opportunity of calling a "spade a spade" and of placing the responsibility for improving the poultry situation squarely in the lap of the industry itself.

Our program here in New England is making definite progress, and it is encouraging to note that consumers in general are intensely interested in learning more about the nutritive value and many uses of eggs. We sincerely hope that you will continue to hammer away at our producers for cooperation.
—Homer I. Huntington, Executive Manager of New England Fresh Egg Institute, Inc., Worcester, Massachusetts.

Selling Eggs at Retail

If, as a poultryman, you have had experience with selling eggs on a retail route, or if you have been successful in selling by parcel post, why not pass along your experience to help others who have problems similar to yours?

Send a letter of about 300 words to the Poultry Department, *American Agriculturist*, P. O. Box 367, Ithaca, New York, on "My Experience Selling Eggs at Retail," and we will pay \$1.00 for every one printed.

Flock Improvement

I have a flock of about 400 hens. I have my eggs custom hatched. What practical method can I follow to improve my flock?

Whatever you do is going to cost you some money. My suggestion is that you make a careful study of some of our best breeding establishments and that you buy either enough pedigreed cockerels to head your breeding flock, or if that costs too much, that you pick out a few of your best hens and buy some cockerels to mate with them. That will get as quick results as anything you could do in your own flock. If it is too late to do that this year, you could buy a few baby chicks from known high producers with the idea of saving some of the cockerels for your breeding pen next year.

"Umpire Dolan's getting in shape for the baseball season!"

WENE EXTRA PROFIT CHICKS

DRASTIC PRICE REDUCTIONS ON CHICKS OF SUPER-QUALITY!
Year by year, WENE quality advances steadily, impelled by our rigid Breeder-Selection Program, reinforced by double testing. Yet giant-scale production, 6,000,000 in 1939, makes possible sensational price slashes, especially on Super and Super-X Matings.

Oven Dinners

By
MRS. GRACE
WATKINS
LUCKETT

—PHOTO
COURTESY OF
CORNING
GLASS WORKS

A CASSEROLE dish is almost a complete meal within itself, combining as it does a meat or meat substitute with a starchy food and usually some vegetables. Other advantages which make it popular with busy homemakers are: It saves both cooking and serving dishes; the baking dish keeps the food hot throughout the meal; it is useful for using up odd tidbits of food; it needs little watching while cooking and may be kept warm even if the meal is somewhat delayed; the oven may be used for other purposes while the casserole dish is cooking.

Oftentimes the "makings" of a casserole dish may be prepared ahead of time, then combined and baked quickly after you come home from an afternoon meeting or visit to town. Also, it is a good "company" dish, because once in the oven it leaves the hostess free to welcome guests without that last minute flurry of gravy to make, etc.

Meals featuring casserole dishes need salads and fruit desserts to complement the main dish. Pickles, celery, carrot strips, shredded cabbage or lettuce offer contrast in texture and flavor. With the fruit dessert, crisp cookies or the flaky crust of a fruit pie provide contrast of another sort. Strips of crisp bacon or browned bread crumbs do their bit toward dressing up the casserole itself.

When using up leftovers in casserole dishes, seasonings are very important because the cooked foods will have lost some of their original flavor. Onions, garlic, peppers of all kinds and curry are valuable aids to this end. Slow cooking develops and blends flavors, and in dishes where uncooked meat is a main ingredient, low temperature must be the rule; but when combining foods already cooked, a quick rather than a slow oven is more often used.

Casserole of Chicken Noodles

2 cups cooked chicken, finely cut
2 cups medium white sauce
1 small package noodles
½ cup buttered bread or cracker crumbs

Heat chicken in white sauce. Cook noodles in boiling salted water, drain and rinse in cold water. Pour into shallow dish, cover with creamed chicken, top with buttered crumbs and brown in oven.

Tuna fish may be substituted for the chicken and elbow macaroni for the noodles if more convenient.

Casserole of Rice and Liver (8 servings)

1 cup rice
2 quarts water
2 tablespoons butter
1 pound liver (lamb's or calf's)
1 teaspoon caramel
2 tablespoons browned flour
2 tablespoons bread crumbs
Salt and pepper
2 cups stock

Wash rice thoroughly. Boil rice in the water, drain and mash rice smooth with the butter; pepper to taste. Line a well-greased casserole with the mix-

ture pressing the paste firmly against bottom and sides, leaving a large hollow in the center. Chill until firm. Meanwhile boil liver, drain, chop fine and season with salt. Heat the soup stock, seasoned with caramel. Make a brown sauce with the fat, brown flour and soup stock. Add minced liver. Fill the hollow in the center of the rice with the liver mixture. Sprinkle with crumbs and brown in the oven, 400° F.

Rice and Vegetable Casserole

2 cups cooked rice
1 cup cooked peas
1 cup cooked corn
2 tablespoons minced onion
2 strips bacon
1½ cups milk
¼ teaspoon pepper
1 teaspoon salt

Place in layers in greased baking dish. When casserole is filled, add milk. Place bacon strips on top and bake until brown.

Lima Beans au Gratin

3 slices bacon, chopped
4 teaspoons flour
1 No. 2 can lima beans (2½ cups)
½ cup grated cheese
¼ teaspoon salt
½ cup buttered bread crumbs

Cook bacon until crisp, blend with flour. Add beans and cheese. Season. Cook until smooth and thickened. Place in baking dish (individual dishes may be used) and top with buttered crumbs. Brown in a hot oven.

Baconized Egg Rings with Potatoes (serves six)

4 cups mashed potatoes
Salt and pepper
Milk or cream
2 well beaten eggs
6 whole eggs
12 bacon strips

Season potatoes well with salt, pepper, milk or cream, and butter. Mix into them the two eggs. Pile lightly into well-greased casserole, making six holes in the surface with the back of a spoon, each large enough to hold one egg. Partially cook bacon and wind a strip or two around each depression. Break an egg into each. Bake in a moderate oven (350° F.) until eggs are set and the bacon browned. Season the top. Grated cheese may be sprinkled over the top towards the end of the cooking, just long enough to melt the cheese.

Corn Souffle (serves six)

3 tablespoons butter
3 tablespoons flour
1 cup milk
½ teaspoon salt
4 eggs separated
2½ cups cooked corn
1 tablespoon chopped green pepper

Make a white sauce of the butter, flour and milk. Season and pour over beaten egg yolk. Add corn and chopped green pepper. Fold in stiffly beaten egg whites and pile lightly in buttered baking dish. Set in pan of warm water and bake at 375° F. for about 35 min. until center is firm.

Scalloped Potatoes and Ham

Place layers of sliced uncooked potatoes in a buttered baking dish. Top each layer with a light sprinkle of flour, dot with butter and season with

salt and pepper. Add milk to just reach the surface of the sliced potatoes. Top with a 1 inch slice of ham. Bake in a moderate oven, 350° F., for one hour or until ham and potatoes are tender.

Baked Creamed Salmon with Spaghetti

1 can salmon
½ pound spaghetti broken fine
3 tablespoons butter
1 pint milk
2 eggs

Boil spaghetti in salted water until tender. Drain in a colander and pour cold water through it. Into greased baking dish put layer of spaghetti, a layer of salmon, bits of butter and pepper; continue until all is used. Beat eggs, add milk and pour over mixture and bake 45 min. Serve with or without white sauce.

Cod Fish and Tomatoes en Casserole

1 No. 1 can tomato soup
2 cups cooked spaghetti, rice or macaroni
1 onion sliced
¼ teaspoon pepper
½ cup flaked codfish
½ cup buttered crumbs

Simmer tomato soup and onion with seasonings until onion is tender, adding a little water if necessary. In a buttered casserole place a layer of fish, one of spaghetti, then one of sauce until ingredients are used up. Cover with buttered crumbs and bake in a moderate oven for 15 min.

Spaghetti Milanaise

1 cup spaghetti
½ cup carrots
½ cup turnip
½ cup cabbage
½ cup onion
½ cup celery
1½ cups milk
3 tablespoons butter
2 tablespoons flour
1 teaspoon salt
3 egg yolks

Brown the flour. Make a sauce of flour, butter, milk and salt, and stir constantly. Cook vegetables, uncov-

ered, in boiling, salted water until they are tender; drain. Cook spaghetti in rapidly boiling water until soft enough to crush easily between thumb and finger. Turn into a colander and dash cold water over it. Combine spaghetti and cooked vegetables; add chopped yolks of hard-cooked eggs and 1 teaspoon salt. Add sauce and toss all lightly together. Bake in a moderate oven for 30 min.

Tamale Pie (serves six)

2 cups corn meal
6 cups water
1 tablespoon fat
1 onion
2 cups tomatoes
1 lb. hamburger steak

Make a mush by stirring the cornmeal and 1½ tsp. salt into boiling water. Cook 45 min. Brown onion in fat, add hamburger and stir until red color disappears. Add salt, pepper and tomatoes. A chopped sweet pepper is an addition. Into greased baking dish put a layer of cornmeal mush, one of seasoned meat and another of mush. Bake 40 min. in 350° F. oven.

Shepherd's Pie

Into a greased baking dish put a layer of mashed potatoes, another layer of cooked minced meat or fish, seasoned well, and mixed with meatstock or gravy and two tablespoons minced onion (if liked). Cover with mashed potatoes, bake long enough to heat through—20 to 30 min., in a moderate oven. Leftover bits of vegetables, carrot, green peas, and boiled onions add interest and flavor if mixed with the meat.

Russian Cabbage Rolls (serves six)

½ lb. pork sausage
½ lb. ground beef
2 tbs. chopped onion
1 egg
1½ teaspoons salt
1½ tbs. melted shortening
½ teaspoon pepper
1 cup corn flakes
Paprika

Mix thoroughly meat, onion, beaten egg, shortening, salt and pepper. Fold in corn flakes. Form into six small rolls, place each in the center of a cabbage leaf and fold over, pinning with a toothpick. These may either be steamed in a covered kettle or baked in a moderate oven, 375° F. for 40 min. Sprinkle with paprika.

Hunter's Pie

½ lb. round steak, cut in cubes
Suet, or 2 tablespoons fat
1 medium sized carrot, diced
2 medium sized potatoes
¾ teaspoon salt
Pepper
2 tablespoons flour
Baking powder biscuit dough (2 cups flour recipe)

Brown round steak in frying pan with fat, add to vegetables which have been covered with water and cooked for 20 min. Make a sauce using the fat left in frying pan, flour and liquid from vegetables. Place all in buttered casserole. Cover with biscuit dough about 1" to 2" thick and bake in hot oven, 400° F. for 20 min.

I Shall Remember

By ROBERTA SYMMES.

I think I shall remember when I'm old
The dance of April on the emerald hills,
The scent of apple boughs in some far May,
The joyous march of golden daffodils.

I think I shall remember when I'm old,
The shining splendor of some summer moon,
A broken dream, a kiss — perhaps a sigh —
The madness and the ecstasy of June.

These things I shall remember when I'm old
And Spring for me forevermore has set;
Then I shall smile to see you sitting near,
And know content and harbor no regret.

cludes a floor length version which is grand for a housecoat. Sizes are 12 to 20. Size 16 requires 3 1/4 yards of 39-inch material, 3 yards ribbon.

LITTLE GIRL'S DRESS PATTERN No. 3218 is just the thing for her slim young figure. Round white collar, buttons down the front and sash for trim fitting at the waist belong to active youth. A washable fabric decorated with intriguing buttons would make the prized frock of her wardrobe. Sizes are 6 to 14. Size 8 requires 2 1/4 yards of 39-inch material, 1/2 yard 39-inch contrasting.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Spring fashion catalog.

Rock Gardens Are Fun

ON MOST home grounds there is at least one place where creeping or dwarf plants could be used to advantage. If the land is sloping enough that rocks may be made to look at home, and not as if just placed there, that would be an ideal place for a rock garden. Even on a level lot with a small grade, often a ledge is possible.

Our own ledge is from 6" to 15" high and 66 ft. long; the number and varieties of plants that this small ledge can accommodate is amazing. Many of these plants I have grown myself; others I have bought or have had as gifts from friends and the result is that from beginning to end of the growing season there is always something of interest in that ledge. Of course, the best show of flowers comes in May and June. Yet there are many plants which I should like to introduce there, some to replace others that I feel I could do without.

In choosing rock garden or ledge plants I have tried to bear in mind they they will be viewed at close range, in contrast to borders which are seen as a mass. Consequently bulbs tend to the smaller daffodils and jonquils, plants to the dwarf forms. Many of the plants shape themselves to the rocks, which makes them look more as if they "belonged".

Usually a beginner at rock gardening starts with golden alyssum, snow-in-summer (cerastium), and phlox subulata in some form or other. While all have their places in such a garden, they need to be used with discretion, color of the alyssum and of some of the phloxes subulata being hard to reconcile with others, and the spreading habit of the snow-in-summer requiring constant control. But all are easy to grow and that is something!

With winter appearance in mind,

the small evergreen, or almost evergreen, plants are important. Among these are perennial candytuft which now comes in other colors besides white, the various thymes (if you can keep them alive), rock cress (arabis) also in other colors, aubretia sometimes called rainbow rock cress, many sedums and the sempervivums (hens and chickens). Many of the two latter classes take on beautiful bronze or red tints during cold weather, besides varying from bluish gray to dark green in milder temperatures. More difficult subjects to grow but delightfully charming are the shrubby daphne cneorum (garland flower) and the Christmas rose (helleboreus niger). None of these will give trouble by spreading too fast.

For shady or slightly moist locations these probably will be happiest: polyantha primroses, hepaticas, trilliums, violets, dwarf bleeding heart, Virginia bluebells, globe flower, dwarf lilies, lilies-of-the-valley and anemones, and many of our native woods plants which come from similar locations.

Other plants which are not so particular, thriving in ordinary sunlight and garden soil are dwarf lavender, thrift, creeping baby's breath, creeping veronicas, pinks, coral bells, geum, dwarf roses, carpathian bell flower in

My Soul Shall Rise on Wings

By EDITH SHAW BUTLER.

My hands must guide the ploughshare
Across this rugged field;
For man must sweat and beast must toil
To reap a goodly yield.

But though my feet must tread the sod
The while a robin sings,
My soul shall take flight with the bird
And rise on shining wings.

blue and white forms, perennial forget-me-not, columbine, wallflower, creeping geraniums, rock rose, iceland poppy, vincas, minor and major, and the violas.

For the hot dry spots in rock garden or perennial borders, these plants are particularly useful: petunias, dwarf zinnias, portulaca, nasturtiums, verbenas, iceplant, bearded iris, gaillardia and cerastiums.

Home Decoration

Anyone who can use a needle and thread, and a hammer and nails, will enjoy Ruth Wyeth Spears' new book, "HOME DECORATION WITH FABRIC AND THREAD." This book gives step-by-step directions for making everything from slip covers to doll clothes. Each idea is illustrated by one or more sketches which show exactly how to proceed.

One whole section of the book is devoted to "Things the Children Will Like"; another tells how to plot a color scheme for the living room, how to modernize an old couch and discarded chairs, how to make a footstool; a third chapter gives easy directions for making all types of curtains. There are clever suggestions for re-modelling furniture; designs for braided, hooked, knitted, crocheted and felt rugs; directions for making colorful table linens, bed linens, embroidery and drawn work, comforters and crazy patch quilts. And so on.

One of the best things about the book is that it makes home decoration a lot of fun—and inexpensive. Miss Spears has a magic way of producing a beautiful dressing table from some old boxes, and of transforming all sorts of odds and ends into useful and charming things. The book is published by M. Barrow and Co., 286 Fifth Ave., New York City, and costs \$2.50.

YOUNG GIRLS ENTERING WOMANHOOD

Lydia E. Pinkham's Vegetable Compound Has Helped THOUSANDS!

Thousands of young girls entering womanhood have found a "real friend" in Lydia E. Pinkham's Vegetable Compound to help them go "smiling thru" restless, moody, nervous spells, and relieve cramps, headache, backache and embarrassing fainting spells due to female functional irregularities.

Taking Pinkham's Compound at "this time" may prove just what health and happiness may need. Famous for over 60 years—Pinkham's Compound is the best known and one of the most effective tonics made to help "women's" functional complaints. Over 1,000,000 women have reported remarkable benefits. WORTH TRYING!

"This is our special family model."

The Napoleon Watch

THAT WATCH was one of the keepsakes which Theodora brought with her when she came to live at the old squire's farm with the rest of us young people in 1865. It was a very old watch, and had come into Theodora's family by way of her mother's great-uncle, who, away back in 1808, had lived in Paris for a number of years, and afterward at Tangier, Morocco.

At that time it was the fashion to engrave the portraits of celebrated men on the backs of French watches, and this watch had on it the likeness of no less a person than Napoleon Bonaparte, but rather as he looked as a young man, and not much like the Napoleon of later years.

The watch-guard, or chain, was not nearly so old as the watch, being what was then termed a hair chain, woven from her mother's long brown hair, and having a pretty gold clasp midway between the watch and the gold hook at the end of the guard. And to a little link inside the clasp there was attached a Moorish charm of very white silver in the form of a girl's hand and having fine Arabic characters engraved on it.

I suppose it was a trinket such as the people there set value upon as charms or amulets to bring good fortune. This great-uncle had told Theodora's mother that the words or signs on the hand meant, "All good things be thine."

The watch did not keep very good time, however, and often stopped; for it must have been nearly seventy years old. I suppose the works were worn out. But after we began attending school at the village academy, Theodora economized for two years, and had the works replaced by a very good new American movement, which kept accurate time.

Afterward, while at the academy, she nearly always carried it. For much of the time we boarded at home, driving back and forth from the farm night and morning, and that Napoleon watch was our mainstay for punctuality at morning services and recitations. In fact, we all had a kind of family interest in the watch. When, therefore, it was missing one afternoon at the old academy, not only was Theodora grief-stricken, but our whole class was much exercised in efforts to learn what had become of it.

OUR class, indeed, was more like a family of brothers and sisters than anything I have ever known at schools elsewhere. There were eleven of us, and a part of the time thirteen, who had begun Latin and Greek together in 1868 under Mr. Kennard. We were congenial spirits, and were all keenly interested in our new studies.

Not very often is a whole class so ambitious to get on rapidly that it will put in an extra hour each day; and not very often, either, is a principal found who will meet them regularly to hear recitations for which he is not paid. But that was what Mr. Kennard did. All that autumn he met us every day but Saturday at five o'clock for an extra recitation in Virgil's Aeneid.

We took fifty lines a day. It was our first attempt at scanning Latin heroic verse. Scanning Latin verse is like singing—it is largely a matter of the ear. One of the girls, Lucia Scribner, appeared to scan at sight, without marking off the number of feet or making the least mental effort.

But Lucia was naturally musical and poetic—a dreamy, imaginative girl, who sometimes acted impulsively. Afterward she was our class poet, and

By C. A. STEPHENS

later in life won a considerable literary reputation. Theodora was a hard student, but she was one of the kind who never think that they have studied enough.

"I haven't half this lesson," she was always saying at the last minute. "Oh, I wish there were just a few minutes more!" she would exclaim, and look at her watch.

The boys often joked Theodora about that little white hand on her watch-guard. She pretended that only by virtue of that charm could she get her lessons. Sometimes, as we heard Mr. Kennard coming in, she would catch it up in her fingers and murmur in jest:

"Id, zad, kullom, zee!
Make all good things come to me.
Make me re-cite perfect-lee."

BASEBALL was then just come into popularity; and that afternoon—the day Theodora's watch disappeared—the village boys were playing the new game at the fairgrounds. A number of the students went over to see it.

This was in September. The afternoon was windy. The girls wore their thick wraps, and Theodora, who did not wish to be late for the Virgil recitation, had her watch in an outside pocket of her jacket so that she could easily look at it.

When she and Lucia went back to the academy at five, she hung her jacket up in the anteroom, and left it there. Mr. Kennard came in and locked the outer door after him. He was an observant man, and as he passed through the anteroom, he noticed the girls' wraps hanging there, and saw the guard of Theodora's watch, with the little white hand on it, showing outside her jacket pocket.

The recitation passed as usual. Another lesson of fifty lines was assigned, and we had started to go out. Bronson, who was in a hurry about

something that night, had already reached the anteroom, seized his hat, and gone out; but recollecting that he had forgotten his Latin grammar, turned back to get it. Lucia, too, had reached the anteroom.

The rest of us were a little behind them, when Mr. Kennard spoke to say that he had recently seen a new book concerning ancient Ilium, which he thought would interest us. He told us about it for a minute or two, and we then went out.

In the anteroom Theodora noticed that her jacket had slipped off the peg and dropped to the floor. Of that, however, she thought nothing, for she had hung it up hastily; but while putting it on she remembered her watch, and then discovered it was missing. She spoke to Ellen. They looked around hastily, but no watch was to be seen.

They then went back to the recitation room, where Mr. Kennard was still sitting and reported the loss.

"That is very strange indeed," Mr. Kennard said. "I am positive that I saw that little white hand hanging outside your jacket. I had just locked the door. I am certain no one has been in the building besides ourselves."

Mr. Kennard then noticed that Lucia and Bronson were not there. "We had better find them and learn if the door was unlocked when they went out," he said. "It is possible, that some light-fingered person was lurking indoors and has taken the watch and gone."

Out on the street we saw Bronson at a distance. Addison hailed him, and he crossed over to us. "Bronse, Mr. Kennard wants to know if the academy door was locked when you and Lucia went out?" Addison said.

"Yes," said Bronson. "I unlocked it to get out. Lucia wasn't with me; she was behind in the anteroom putting on her things."

"Doad's watch disappeared while we were reciting," said Addison.

Bronson was astonished. "That's too bad!" he exclaimed. "But didn't she lose it at the ball game?"

We told him that Mr. Kennard had seen it in the anteroom.

"That's mighty strange!" Bronson suddenly turned very thoughtful and did not say another word about it.

Mr. Kennard considered it a serious

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Spring's Design

Soaked lawns and purple violets
Shyly observing me from golden eyes;
Trees with shiny baby leaflets;
Hyacinth ladies, in blue, rise
In front of yellow crocus dames;
A row of crimson tulips stare
As pulpit preachers call their names,
Reminding them to kneel in prayer
To ask that gentle Spring might stay
And finish out her plans for May.

—Eleanore Randall Lamkin.
Detroit, Michigan.

matter, and at algebra recitation the next morning he spoke of it, asking Bronson and Lucia if they were sure the outer door was locked when they went out.

Bronson repeated to Mr. Kennard what he had told us. As for Lucia, she seemed as distressed as Theodora, and looked quite pale.

ON Saturday, Addison and I were at home, picking apples. Somewhat to our surprise, Bronson walked up from the village and came into the orchard, where we were at work. He at once began talking about the missing watch.

"There is something I think I ought to tell you about that," he said. "At first I thought I would never say a word about what I saw—for maybe I was mistaken. But," he lowered his voice almost to a whisper, "I think Lucia has taken that watch!"

"I don't believe it!" I exclaimed. But I noticed that Addison did not say anything, or even look up from his work.

"What was it you saw, Bronse—that is, if you want to tell?" Addison asked.

"Now, of course, I may be all wrong," he said, "but when I ran back into the anteroom to get my Latin grammar, Lucia stood there by the girls' wraps. She had Theodora's jacket in her hands, and she was putting something in her pocket. She started nervously when she heard my step, and hung Theodora's jacket up, but it fell to the floor. 'You frightened me!' she exclaimed, turning around. 'I thought you had gone!'"

"At the time I thought nothing of it," Bronson went on. "But afterwards I began to think how strangely she spoke and how nervous she was. And ever since, in class and at the academy, I can see that she isn't herself."

"Have you said anything about this to Mr. Kennard?" Addison asked.

"No. Do you think I ought? Nobody thinks more of Lucia than I do."

"Well, if you haven't said anything, I wouldn't, just yet," Addison remarked. "Nor to Theodora, for she would not believe it."

"What I do think is this," Bronson continued, after we had stood a while. "I think that for some reason Lucia wanted that little white hand on Theodora's watch-guard, for I have often seen her sit and look at that. But I may be all wrong, you know, about the whole of this. I hope I am."

"Bronse, let's all keep still a while," Addison said. "Let's not say one word about it."

Bronson went back to the village without remaining for supper, as he

The Song of the Lazy Farmer

I LIKE to see the seedlings sprout and watch the little plants pop out, there's magic in the days of spring when new life flows in ev'rything. There's promise in the very air, of crops to come and acres fair all burstin' with the urge to grow and multiply the grain we sow. In spring it's fine to plow and plant, it may be in the fall we can't find markets for the stuff we raise, but now on pleasant spring-time days our thoughts are only on the vim that pulses thru each bud and limb. The seed that slept the winter thru wakes up to greet the sun and dew and quickens into life because it keeps in tune with Nature's laws. Each spring life starts anew again, the patter of a springtime rain is telling promises to us of crops that will be bounteous, we toil with Nature and with God when we are turning up the sod.

There ain't no other job on earth as good as farmin' when

the birth of spring wipes out last year's mistakes and turns our thoughts to hoes and rakes and greenin' grass and sproutin' seeds that may be grain instead of weeds. I'd hate to work shut up indoors with feet a-pounding concrete floors, with all the green that I could see the top of some far-distant tree. I might have more cash in my jeans, but money's dead, it ain't like beans that sprout and grow and reproduce, for my part I ain't got no use for anything that in the spring ain't got no life; I couldn't bring myself behind a desk to sit where nothing grows, I'd have to git away from there right fast, by jing, to let my soul expand in spring.

usually did, or even going to the house to call on Theodora and Ellen.

DURING Monday there came on a heavy northeast rain storm, and instead of driving home from the academy that night, we remained at the village. The old squire owned a house and stable there, which was unoccupied. The house was in part furnished, and in very stormy weather, we used to stay there overnight. There was a kitchen and stove where the girls would cook, and by resorting to the village bakery, we got up fine "spreads".

The place became a rendezvous for the whole class, as well as for many of the other students, and was nicknamed "The Branch," meaning a branch of the academy; for if a student could not be found at the schoolroom, he would generally be found there.

Knowing that we had not gone home, our classmates came in during the evening, wet as it was; but this time it was less for a social gathering than to talk over the loss of the watch. Lucia went directly to The Branch with Theodora from our five o'clock recitation, and took supper with us.

Lucia's home was in Portland, sixty miles away, a home where she had everything that a girl could need or care for. During term at the academy she boarded in the village, at the house of a relative of her family.

But nothing that was said that evening about the watch amounted to anything. Addison and Bronson, as I recollect, sat listening to the others, saying very little. As for Theodora, she had ceased to speak of it if she could help it.

Quite late, and just as the rest were going away, Addison gave his knee a great slap and jumped to his feet.

"There!" he exclaimed. "There is one place where we haven't thought to look for that watch. I will look there the first thing tomorrow morning after the academy is unlocked!"

"Where's that?" we all exclaimed. "I shouldn't wonder a bit if that watch slipped out of Theodora's jacket pocket when the jacket fell down, and dropped in that hole." Addison went on, looking straight at Lucia.

"But where? What hole?" we asked. "Why, don't you know that hole that's knocked through the old plaster and laths there in the wall of the anteroom? It is right under the row of hooks where the girls hang their wraps, about half way down to the floor."

Vaguely we all remembered that there was such a small hole in the plastered wall there—a hole as large as one's hand, perhaps. But it did not seem likely to any of us that the watch had got in there. Several of the boys cried, "Shucks, Ad! What are you thinking about?"

But Addison went on, asserting that the watch had slid into the hole in the wall. "I shall look there!" he declared. "I shall look just before nine tomorrow morning!" And I noticed, as he explained about the hole, that he was still looking at Lucia.

LUCIA remained at The Branch that night, but she left early the next morning to go to her boarding place. The rest of us slept rather late, for the morning was dark, wet and chilly. It fell to my lot to go to the bakery, and I met Lucia coming up the street from her boarding place, as if on her way to the academy.

"Aren't you pretty early?" I asked. "I suppose I am," she replied.

We had our breakfast at about half-past eight. After it Addison got a hammer and went out. Theodora, Ellen and I set off for the academy at a few minutes before nine. When we got there, Addison, with a crowd of students behind him, was in the anteroom,

What Happened to the Cousins?

SINCE we have been publishing the fine old stories by C. A. Stephens there have been a good many inquiries as to what happened to Halstead and the rest of the cousins who made life so pleasant when they were young on the Old Squire's farm. To get the exact information to answer the inquiries, we wrote to Mrs. Stephens, and have received from her the following letter:

"I will say that Halstead was murdered in Texas, it was supposed. His story is told in 'The Old Squire's Great Grandson', a serial. Little Wealthy died, as related in 'When Life Was Young', the first volume in the Memorial Edition of Old Squire tales. Ellen married a young rancher, and went to the Dakotas, where, also, Theodora became a distinguished teacher of little Indian girls. She taught these 'little brown maids' as she called them, for several years, then married a young officer of the Civil War, and after his death resided with her daughters, who taught successfully in Brooklyn. Addison became a distinguished zoologist, and died two or three years before Dr. Stephens went away. Theodora was the last to go. She passed on a few years after Dr. Stephens died in September 1931."

prying off the baseboard.

He then broke through the lath and plaster, and to the astonishment of all, drew forth Theodora's watch, with the guard and little white hand attached!

Mr. Kennard had just come in. He was as much astonished as anyone. There was a noisy babel of voices, more than fifty of the students pressing into the anteroom; and in the background I recall seeing Lucia with a strange sort of smile on her pale face.

As for Theodora, she gave a great cry of joy when Addison passed the watch to her. She looked at it fondly, wiped off the lime dust, and then held it to her ear.

"Why, it's ticking!" said she, wonderingly. "It's still going! How can that be Ad—after four days?"

For an instant Addison looked nonplused, but he rose to the emergency. "Probably the shock, as it fell down, stopped it," said he, "but when I took it up it started again."

I noticed that it was just nine o'clock by it, but said nothing, for others were now looking the watch over—all talking loudly.

Mr. Kennard stood by, his face wearing a very puzzled expression. He turned away abruptly, went into the schoolroom, and the bell rang.

I do not recollect ever hearing him mention the matter afterward, but once

or twice that term I saw him pause while going through the anteroom, and stand looking at the hole in the wall. Our preceptor had a mathematical mind; he was trying to work it out.

That is about all there is to tell, except that at Christmas, after the students had gone home, Addison received, anonymously, a very beautiful album. It came by express from Portland, but we never knew who sent it.

Yet I think that my keen-witted readers have already made up their minds. Still, there may be a few as slow as I was myself. It took me a number of years to think it out and come to the conclusion that Lucia put the watch in that hole the morning we found it.

I now suppose that she had coveted that little white hand. Maybe she

imagined that it would bring her better fortune with her algebra lessons; who knows?

Yet I do not believe that she had planned to steal it. But when she saw it there in the anteroom that afternoon, I think she yielded to a sudden impulse which she would have checked if she had had time to think it over.

I suppose that Addison suspected just what had befallen Lucia, and that he took that shrewd, kind way to rescue her from the consequences of her false step without loss of her character and self-respect. I think that Addison knew, and I fancy that Lucia knew that he knew; but I could never get a word or a hint out of him concerning it. He always had that superior way of keeping his own counsel in matters of that kind.

Personal Problems

Use Material at Hand

Dear Lucile: What does a girl do when she is absolutely desperate for company? Here I sit, night after night, hoping and praying that some miracle will happen and a handsome (or even just nice) young man will come knocking at my door.

But my dream prince doesn't come—not one solitary soul comes. I'm a good-looking girl, don't have bad manners, dress nicely, have a pleasant voice and don't talk people to death. Please don't take this as a lot of self-praise. It's not. I'm just giving myself an inventory to see if I can find out what's wrong with me or what I should do to meet some nice boys. I realize that I'm no flaming beauty, but I've taken what good looks God gave me and made the best of them.

If I could only meet some nice boys, I know I could make them like me. But just where does a person meet decent boys? I can meet and get boys of the wrong kind, but that isn't what I want. What advice can you give me?—Marie.

While it is very difficult to analyze character by correspondence and from what you have told me I cannot single out just what your shortcomings may be, I would say in a general way that you are spending too much time in dreaming about some "Prince Charming" instead of trying to work with the material which you may have at hand.

Perhaps if you would widen your interests a bit, open your eyes wide and start meeting the young men you have opportunity to meet on their own level you would become better acquainted with them and perceptive of good qualities in them which you do not now recognize.

Certainly, there are boys in the world who will treat a girl like a lady; no doubt many of the boys that you know would treat you in the manner which you desire if you gave them a chance. It is nearly always the case that the young lady sets the pace for the behavior of the young man with whom she is and I do not think you need to worry. Very few boys will take undue advantage of nice girls.

I note that you live in a city and I wonder if you have made any contacts

IT IS EASIER to discuss a personal problem with an absolute stranger than it is with a friend, unless that friend be unusually intimate and understanding. If you have a problem, write to Lucile, Personal Problems Editor, American Agriculturist, Box 367, Ithaca, N. Y. If you wish, Lucile will send you a personal reply by mail. If your letter is printed, your identity will be carefully disguised. Please enclose a self-addressed, stamped envelop if you wish a reply by mail.

with groups in a church or with any social center activities such as are carried on in many large cities. I realize that it is a bit hard to meet young men if you are a stranger in a city but the two sources which I have mentioned do contain possibilities.

* * *

Shall He Take Her Home?

Dear Lucile: This may be a funny letter to write you, but I want to know what you advise me to do in this case.

I come from very poor people. Our house is not nice nor are the furnishings in it. Ever since I've gotten away from home and out in the world for myself, I've been ashamed of my home. Now, I've met a girl from a well-to-do family and our friendship is fast ripening into love. I have been beautifully entertained at her home many times and she wants to meet my folks. What shall I do—I don't want to take her home? Is there any solution to this, so nobody's feelings will be hurt?—Perplexed.

First, I would say that though a home be humble, there is no reason to be ashamed of it, if it is well-kept and a cheerful atmosphere is preserved. If your home is neat and clean and your mother and family would put a good foot forward and enjoy welcoming your friend, I should not hesitate for a moment to take her home. She will love you all the more for being kind and considerate of your parents and letting her see you just as you are, instead of trying to create a different impression in her mind.

However, sometimes I realize that poverty seems to breed carelessness and if your mother does not keep a nice house, with the poor materials she has at hand, there may be valid reason for your feeling about your home. In such a case, why not explain to your friend that your mother feels embarrassed by guests, and have your parents meet you at some good hotel or cafe, for a meal and a getting-acquainted period. This might be a real treat to your mother and she might enjoy it better than trying to entertain at home, although that is first choice.

* * *

Please Note: There is one question Lucile cannot give advice on, that is, when an engaged couple fall out over religion, where one is Catholic and one Protestant. She does not feel competent to settle serious differences of this nature. Rather, she would advise that the parties involved seek the counsel of their priest and minister.

"He wants an old-fashioned ceremony, Sir. You know, the one with the OBEY part in it."

"DEMOCRACY In Action"

(Continued
from Page 1)

land have always furnished more than their share of men who have come to sit in the seats of the mighty.

In the next county and less than thirty-five miles away as the crow flies is Plymouth where Calvin Coolidge was born and where he grew to manhood. Men laughed — perhaps some of them sneered—because Coolidge ate apples as he sat in Cabinet meetings and talked of "hiring money." I rather liked him therefor. It meant that he took with him to Washington much of the simple, folksy ways and homely, salty speech of his native heath. I judge that Calvin Coolidge was closer to the grassroots than any President since Lincoln.

TOWN-MEETING Day in Vermont dawned this year on the heels of the worst snow storm of the season. I had been assured in advance that the Vermonters did not let the mere matter of weather interfere with their annual Parliament, and this seems to be literally true. Spite of deep snow everywhere and hill roads that must have been well-nigh impassable, the embattled voters turned out in numbers not greatly below the fair weather attendance.

I like the phraseology of the printed warrant for the meeting:

"The legal voters of the town of Townshend are hereby notified and warned to meet in the Town Hall in said Town on Tuesday, the fifth day of March, 1940, at ten o'clock in the forenoon to act on the following articles, viz:

Art. 1. To choose a Moderator for the year ensuing.

Art. 2. To see if the town will instruct the Selectmen to appoint one or two road commissioners as appointed by law. (This article was debated and by a rather narrow margin, they were instructed to appoint two).

Art. 3. To vote upon the following questions: Shall license for the sale of malt and vinous beverages be granted in the town? Shall spiritous liquors be sold in the town? (For this Article a ballot box was kept open from eleven to three o'clock. Result: Beer and wine only, 11 votes. Spiritous liquors, 22 votes. Bone dry, 126 votes. Alcohol is not a debatable question in rural Vermont.)

Art. 4. To elect all town and school district officers required by law for the ensuing year.

Art. 5. To see if the town will vote to adopt Day Light Saving Time for the year ensuing. (I regret to add that it was adopted by a rather narrow margin. The feeling seemed to be that while it was a most miserable nuisance, the proximity of industrial towns made it necessary to conform. It would seem that the once inflexible New England Conscience is getting lax.)

Art. 6. To see if the town will vote to appropriate a sum of money, in addition to that required by law, for the Library; if so, how much.

Art. 7. This had to do with the employment of a town physician.

Art. 14. This was a proposition to employ an auditor and public accountant to audit the accounts of the town officials. (It was overwhelmingly defeated without discussion. Evidently the voters of Townshend have entire confidence in the competency and honesty of their officials.)

All in all there were fifteen definite propositions to come before the meeting. This is not, according to New England standards, a large number. Indeed there lies on my table the call for the Meeting of the Town of Webster in Maine where the electors will be called upon to wrestle with thirty-five different questions.

The difference between the New York and the Vermont system is fundamental. It is the difference between a rep-

resentative and a direct democracy. In Vermont, except in relation to the Courts, the County cuts almost no figure. So far as government is concerned, the Town is everything. In New York a Town Board may choose to consider a proposition if they deem it has popular backing enough to make it seem worth while. The Board may act upon it or they may quietly let it die. On the other hand, in Vermont the humblest citizen acting on his own behalf and without a single supporter may give notice of any proposition which he wishes to have acted upon, and the Selectmen are bound to make it a part of the order of business. If they fail to do so, its proponent may in Town Meeting stand up on his own feet and demand rather than request that his measure have consideration, and he may speak at any length in urging its adoption.

The Chairman of a Vermont Town Meeting is officially "The Moderator". Perhaps it was a concession to bad roads that made it a half hour past the appointed time when Moderator Stanley Martin stood up before an audience that pretty well filled the hall and with his gavel rapped for order. Vermont women take their political duties and privileges very seriously and to my surprise made up a full half of the meeting.

IN THE Green Mountain state the traditions of Puritanism still survive, so that custom and decorum decree that the Meeting be opened with prayer. The minister of the Congregational church, a fine appearing man no longer young but with the face of a scholar, offered an invocation which to me appeared the almost perfect model of what a prayer for this particular occasion should be. It was so brief—and so fitting—that I could remember it almost exactly but I asked him to write it out for me so that there be no mistake. "Our God and Father. We ask Thy gracious guidance for the Country which we love, the State which is ours and the Township in which we live. May all that we do be done in decency and order, to the honor of Thy name and the well being of all. In Thy name we ask it. Amen."

I found a good deal of a thrill in the administration of the "Freeman's Oath". In New York state any man or woman who is twenty-one, out of jail, and a resident of the state and county

and election district for a certain prescribed period, is thereby a voter. Not so in Vermont. Every citizen before becoming a voter must take this oath:

"You solemnly swear that whenever you give your vote or suffrage touching any matter that concerns the state of Vermont you will do it so far as in your conscience you shall judge will most conduce to the best good of the same as established in the Constitution without fear or favor of any person. **SO HELP YOU GOD.**"

Three first voters stood up before their fellow townsmen and took this oath in order that they might be qualified to take part in the deliberations of the day. I believe it is a good thing that at least once in his life the voter should have impressed upon him the solemn fact that the right of suffrage is a sacred and precious heritage.

I AM going to hazard the statement—or the guess—that taken as a whole the New Englanders of the rural towns are versed in parliamentary law beyond any other section of our people, because from their youth up they have been nourished in the Town Meeting. Many votes were taken during the day and on some questions the results were very close. The usual form was a voice vote by Yea and Nay. Then the Moderator would announce his decision—perhaps, "The Nays have it." If the vote was really in doubt, as happened several times, someone would call for a ballot. Then a ballot would be taken not upon the original question but upon the question of whether or not the decision of the Moderator would be sustained, which of course amounted to precisely the same thing.

It is worth noting that in the Townshend meeting there was no such thing as an official or printed ballot. Every voter had provided him or her self with an ample supply of slips of white paper on which he wrote his choice for town officers or recorded his position on any contested question. I was surprised to see how quickly a ballot could be taken. There was no pretense of polling or recording the name of each voter. The electors filed past the table almost as fast as they could lay down their ballots and in a very few moments the result would be announced. I marveled a little at the lack of all the formalities to which I was accustomed at our Central School District Meeting, but was calmly assured that the Moderator and the Town Clerk could call every voter in town by his or her first name and that there was not the most remote chance that any unqualified person would be allowed to deposit his ballot. There were, of course, no paid watchers or clerks or any of the usual de-

vices for enabling worthy political workers to be rewarded with the opportunity to earn a little easy money on election day.

EVERY man in Vermont is subject to a Poll tax, and failure to pay this results in the loss of rights as a voter. The amount is not uniform for the state but is the sum which a man would be required to pay if he owned taxable property to the amount of one hundred dollars. In Townshend this year the tax rate is \$3.85 per \$100.00, so this is the amount of the Poll tax. After a man becomes 70 years old this tax is remitted. He may then be enrolled as an Elder Statesman without cost to himself.

I was told that when some very momentous and hotly contested question was to be decided the Moderator might in his discretion rule to "Divide the House" by declaring that those in favor may go to the right side and those opposed may take the left. This method puts every voter on the spot. It is Democracy reduced to its simplest terms.

To be chosen one of the three Selectmen (you must emphasize all three syllables equally and fully—Seelectmen) is surely an honorable ambition, but it does not lead to wealth. Article 13 of the Warrant reads, "To see what pay the town will allow its town officers." This was fixed at \$3.00 per day, while "Charlie" Cutler who has been Town Clerk almost as long as anybody can remember, and who is credited with knowing more Vermont law than the Attorney General, draws pay by the hour at the rate of thirty cents. I really feel that Townshend drives a pretty hard bargain with its elected officials.

AT High Noon the Meeting recessed for dinner. A noonday feast is an orthodox feature of all proper Town Meetings and I am willing to believe that Townshend ranks near the top. The village is fortunate in that its two Churches, Congregational and Baptist, are federated and the ladies of the united congregations put on the dinner. Everybody swarmed downstairs to the dining-room where the long tables had been set up and loaded. We fell upon the meats and scalloped potatoes and scalloped corn and macaroni and baked beans of many different vintages and brown bread and white bread and biscuit and pickles and jellies in infinite variety and all the kinds of pie that I had ever heard of and every thing in riotous profusion.

The most remarkable thing about this meal was the price. I have had a very wide experience in consuming Grange and Church dinners. I have eaten dinners probably just about as good for a half dollar and now and again I have come on perfectly satisfying meals for say thirty-five cents, but this banquet at a quarter of a dollar established a new mark in the low cost of living.

The afternoon was like unto the forenoon with voting and balloting and discussion, until at length it appearing that there was no further business to come before the Meeting, able Moderator Martin proclaimed it adjourned and the assemblage broke up to return to their farms, having once more conducted the affairs of the town according to the ancient ritual.

I came away from Townshend with a good deal of a thrill because I felt that in a day when we cannot but fear that democracy is going into eclipse and when there are great areas of the world where there is no longer even pretense of letting the common man have a voice in his own destiny, here in New England still survive many hundreds of communities where free men and women stand up on their feet, and out of their own desires and wisdom make the laws for their own guidance. We may be devoutly thankful for this kindling spectacle.

"We don't want our neighbors to know we can't afford a stove."

By
Romeyn Berry

WITH the possible exception of the postage stamp, you get more for your money when you buy a pair of blue overalls than you do in the purchase of any other one thing. Blue overalls cost anywhere from 98 cents to \$2.50 and they'll endure for two years under conditions that more expensive woolen trousers would not survive two months. Warm in winter when they're new, cool in summer when the filler has been worked out by many washings, they come pretty close to being the universal masculine garment, once you get outside the city limits. Millions of Americans wear them six days a week, and some seven.

More and more, too, in recent years women have taken to wearing blue overalls. Whether you approve of that depends partly on how you were brought up and partly on the lady. If you are against it, and pretty bitter on the subject, I'll go part way with you and admit it's a mistake—for some.

I like to lay in my blue overalls in the fall along with the other winter supplies—two or three pairs at a time—and then let them age and cure gradually. In that way you get the advantage of whatever they put into blue overalls to make them hard as a board when they're new, and you get it at a time of year when the American farmer needs wind-proof pants more than he needs special legislation from Congress. Given foundation garments of the proper number and consistency under a pair of new overalls tucked into felt boots, and you are better fixed to go out to the barn at five o'clock on a winter morning than any Act of Congress could make you.

I understand that Admiral Byrd's experience with antarctic cold has led him to much the same conclusions; that he has discarded heavy furs for a light closely-woven garment which is nothing more than blue overalls that have been to college and picked up a lot of new ideas about keeping out the cold.

Purchased in the fall, worn and

washed all winter, by the time spring comes blue overalls have softened up so you can bend over enough to drive a fence post in them, and by late May you can put them in with the rest of the wash without having the pillow cases and the parlor curtains come out blue, too. That color question is a point on which men and women are apt to differ. I rather like the changing colors of blue overalls, the process that carries them through the crowding months from the dark blue of a policeman's overcoat to the light blue of the summer skies. There's no monotony—never a dull moment. In effect you have a different garment every time you wash a pair. But my wife, otherwise frugal and saving, wishes they'd charge 10 cents more for blue overalls and then put 8 cents of it into a dye that would stick, and not get into everything else, and not make the snow look that way on Monday morning outside the kitchen door where we throw the wash water.

If you get them two or three pairs at a time, and change off and rest them up occasionally, a good pair of overalls ought to last a farmer two years. That's important because I don't care for any overalls the first year, and I don't become really fond of a pair until they've worn limp and paper-thin, and are the peculiar blue of chicory along the August road-side, and are just about ready to fall apart at the first hearty sneeze. When my wife gets mad and swears she'll never put another patch on that pair of overalls, I know they are just the way I like them most. At that point we take them out of regular circulation, and put them in a special pile in a particular bureau drawer. That pile is my haying pants, and I prize it above our choicest possessions. True, we couldn't sell it for anything, and it has no proper place in the inventory, but it's taken me years to accumulate that stack of thin, fresh,

clean, cool blue pants and get them just the way they are; and I'm going to enjoy them immensely come haying time.

To start another hot day in a pair of clean, thin overalls is just as refreshing as a restful sleep, and you can't have too big a pile in the bureau drawer; and while I'm years past the point of dwelling too much on my personal appearance in the hay field or while tramping it down back in the

bay, I honestly believe I look my very best sitting on a red hay-rigging in a pair of cool, chicory-blue overalls limp and clean from many washings. They feel nice, too, on a scorching morning when the gray team break into a trot going down the lane to the meadow—the first and last suggestion of a trot for that laborious day—and achieve enough speed to make a delicious, artificial breeze blow up the pant leg.

AN ESSAY CONTEST

"How Rubber Tires Have Changed Farm Equipment and Methods" is the subject for the 1940 National Farm Essay Contest sponsored by the GOODYEAR TIRE AND RUBBER COMPANY of Akron, Ohio. The contest is open to Future Farmers of America and 4-H Club members who are in high school and live on farms. Essays are limited to from 800 to 1,000 words.

Ten grand prize winners will be given an all-expense trip to the Canadian camp of P. W. Litchfield, Goodyear President. There will also be twenty-five cash prizes of \$25.00 each. Closing date of the contest will be May 15, and winners will be announced about July 1.

* * *

DEVELOPMENT OF CHAIN STORES

"The Chain Store Tells Its Story" is a new book published by the INSTITUTE OF DISTRIBUTION, INC., 570 Seventh Avenue, New York City. The book gives an interesting story of the development of chain stores, points out some of the problems and advantages of this method of distribution, and answers some of the charges that have been made against chain stores. Price of book is \$1.00.

* * *

BUILDING PLANS

The first step in any building, and often the most difficult one, is the plan. Recently there has been considerable interest in the use of steel in farm buildings. Plans for steel poultry buildings are available for the asking from the AMERICAN ZINC INSTITUTE, INC., Department 36, 60 E. 42nd St., New York City.

If you are building with concrete, excellent information is available from the PORTLAND CEMENT ASSOCIATION, Department K3e-1, 347 Madison Ave., New York City. A handy way to get the information is to use the coupon on page 9 of the March 30 issue of *American Agriculturist*. This can be pasted on a post card to save time.

* * *

EASY RECORDS

One way to increase the keeping of valuable records on the farm is to make them easier to keep. This is the rule followed by the Advertising Department

of DODGE DIVISION, CHRYSLER MOTOR CORPORATION, Detroit, Michigan, when they made available to farmers a little booklet "Operating Record for Motor Trucks and Passenger Busses."

The book has a double-spread page for each month of the year, allowing the operator to set down the daily expenses for gasoline, oil, repairs, and maintenance. The book is available from Dodge dealers or direct from the company whose address is given above.

* * *

MILK MAKES CHICKS GROW

If you are mixing your own chick mash, you will be interested in information about dry skim milk. To get the information, write for bulletin No. 210-E, addressing your request to the AMERICAN DRY MILK INSTITUTE, INC., 221 N. LaSalle St., Chicago, Ill. This booklet will show you results from the use of skim milk and will give you directions for including it.

Recently introduced by the W. F. ALLEN COMPANY, 17 Evergreen Ave., Salisbury, Maryland, is the Green Mountain strawberry, originated by Governor George Aiken of Vermont. This is an ever-bearing variety, and the picture above was taken on October 25, 1939. It is an interesting fact that the berries grown in the fall are rather long, flat and wedge-shaped, like those above, while the berries grown in the spring are similar in shape to the varieties Aroma and Chesapeake.

NITROGEN FOR PEACH TREES—Broadcasting Chilean Nitrate of Soda in a peach orchard. This is especially effective on trees which lack vigor when applied about two weeks before bloom. Up to a pound can be used on young trees, and from 2 to 5 lbs. a tree on older trees. The nitrate should be spread around the tree in an area slightly greater than that covered by the branches.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

THIS IS A PLEA for making farming a more interesting "way of living." *I believe that such an objective can be accomplished without in the least detracting from the usefulness of a farm as a means of making a living.*

NEW GRASSES

To illustrate what I mean, we are sowing at Sunnygables this spring several new grasses. These are being put on in small quantities with a Cyclone seeder. They didn't cost much and we are not risking much in trying them out. I feel convinced, however, that the sowing of these grasses has added considerably to the interest in our farming operation of the men and boys who are engaged in it and that similar projects can be utilized to make all the difference between making farm work a humdrum, colorless task or one of the most interesting jobs in the world.

Brome Grass. On a field seeded with wheat last spring where the seeding failed because of dry weather, and on which we made an emergency seeding last fall, (which we do not yet know is going to come on this spring) we have seeded Brome Grass. Brome Grass, as I understand it, is a dry weather, dry soil grass which gives some promise. I remember seeing a lot of it growing in Texas on the great King Ranch, but I have never seen any in the Northeast. All of us shall watch what our seeding does with keen interest.

Crested Wheat Grass. On another dry and unfertile field which was sown to oats last spring and seeded and on which the seeding failed we are sowing Crested Wheat Grass with another seeding of oats. This is another grass we are told promises much on certain types of dry and relatively unfertile soils.

Reeds Canary Grass. On still another field we are sowing Reeds Canary Grass which is supposed to do well on heavy, wet land and this is the kind of field on which we are putting it.

Ladino Clover. Finally, we are making two sowings of five pounds each of Ladino Clover. One of these seedings will be made on a fall seeding of alfalfa which did not get a good start last fall and doesn't look as though it would do much this spring, but the ground is sweet and fertile and makes a most interesting place to check out a combination of alfalfa and Ladino Clover.

Now, the big point I am trying to make is not in regard to what we are trying out at Sunnygables, *but in support of the practice of trying things out on farms generally just to add interest to the job.* For example, we are also going to try out some methods of weed control. I will write more about these experiments later.

I have long had a feeling that the farm horse is due for more consideration. In England, they love the horse and according to what I have read and personally observed there several years ago, they get a good deal more work out of their horses because they use them more intelligently than we do in the United States. Something over a year ago my attention was called to the two-wheeled English cart shown in the picture above. Because this cart with its inflated rubber tires, ball bearings, adequate lubrication, and dumping feature appealed to me, I ordered one for Sunnygables. Six months after I placed my order the cart arrived in Ithaca all done up in two or three neat packages. The boys assembled it and I bought a cart harness from an old firm in Buffalo, New York, and the cart is now in daily use on the farm.

Exactly balanced, the cart dumps at an angle sharp enough to shed any material which is likely to be loaded into it, from gravel to hay. Our long experience with gravity dump trucks make us very sure that the dumping principle should be incorporated into horse-drawn equipment.

Picture at right shows why the cart is licensed as a trailer. In 60 seconds, by pulling out pins which hold shafts in place and inserting a short iron tongue, it is converted into a practical trailer which can be used behind an automobile, truck, or tractor. **NOTE:** We believe that by using a rubber-tired hay loader behind the cart a 1700 or 1800 pound horse can be used by one man to put on a load of 2500 pounds of green hay. We are going to try out the combination because it certainly will be a cheap one to operate in making grass ensilage.

The capacity of the cart is an eye-opener. It is rated to carry two tons and I feel quite confident that in ordinary going a 1500-pound horse can handle a load of between one and two tons with ease. Note the license plate for farm trailers which costs only a dollar.

Down Mexico Way

By H. E. BABCOCK, JR.

"The biggest news this week is the snow storm Friday, April 5. The storm started about eight in the morning and continued until early the next. The snow was as wet and heavy as any I have ever seen. We just quit farming after it started. At noon I went to town and the slush on the road was so thick that I had to shift into second several times in order to get under motion.

"In all, about an inch of rain fell. Since it was mostly in the form of snow, there was very little running off. It will save us about \$200.00 in electricity for pumping. Monday we are going to continue watering some bare ground and the sweet clover on the Chisholm Ranch. The snow has already done the oats a world of good. The only damage that it seems to have caused is the breaking up of several geese. We only have 182 geese and

were counting on every gosling that we can get for replacements.

"The ground for the Hardigan alfalfa was practically ready for sowing with about four inches of water put on it. We will be able to sow by Thursday. I got quite a kick out of the fact that one day we were putting four inches of water on one field and two on another and three on another. It certainly is nice to be able to control your rainfall for each crop.

"The winter wheat has just been watered and we will have to pasture it soon to hold it back. Small grain crops are held back to provide a maximum of pasture before they are allowed to put up shoots and begin to produce grain.

"We shipped a car of 283 lambs last Thursday. This leaves 418 cut-backs, some of which are so runty that we have put them on grass with the ewe flock. The ewe flock totals 312, including 28 Dorsets. There are 78 grade lambs and 34 Dorset lambs. Lambing is going along smoothly with the ex-

ception of a few first-lamb ewes. The car of lambs shipped the week before brought us \$1299.15.

"We haven't sold our wool as yet. I talked to a wool buyer in the hotel last night who said that he had looked at our wool and felt that we were holding it a little too high. The whole market looks so uncertain at the present time, he said, that nobody was buying any wool. Most of the ranchers are shearing now, so that the complete clip for this section isn't in yet."

Horse lovers may be interested in the mare shown hooked to the cart in the pictures on this page. She is Belle, five years old this spring. The interesting thing about Belle is that she has already put in two years of light work and provided her own replacement. Her yearling son looks just like her and gives promise of growing out to at least 1800 pounds. His sire was a purebred Belgian which weighed considerably over a ton.

Who Can Vote at School Meetings?

ON THE first Tuesday in May hundreds of school districts in New York State will hold their annual meetings. In recent years the question of eligibility of voters at school meetings has frequently come up. Here are the facts:

All voters in either union or common school districts in New York State must be citizens of the United States, 21 years old, and a resident of the district for at least thirty days just preceding the meeting.

In addition, voters must have ONE of the following qualifications:

1. Own, lease or hire real estate in the district, liable to taxation for school purposes. Under this provision one person may vote unless the deed or lease is a joint one, in which case both may vote.

OR

2. Be the parent of a child of school age, providing the child attended the school at least eight weeks during the past year. Under this provision both father and mother can vote.

OR

3. Have permanently residing with him or her a child of school age who attended school for at least eight weeks during the past year. Under this provision one person can vote—the head of the household.

OR

4. Own personal property assessed on the last assessment roll of the town in excess of \$50.00.

Qualified voters may vote on any question brought up at school meeting.

Any qualified voter can challenge the vote of a person who he knows or believes lacks the necessary qualifications. The person so challenged must then, in order to vote, make the following declaration: "I do declare and affirm that I am and have been for thirty days last past an actual resident of this school district and am qualified to vote at this meeting." If the person challenged makes this declaration, his vote must be accepted. Any person who makes a false declaration of

his right to vote is guilty of a misdemeanor, which is a serious offence.

How We Lost \$1,000

I am writing this true story as it may prevent someone else from losing \$1,000 as we did some years ago. These are cold facts. An old saying is, "Look before you leap!" My advice to you who may read this is "Stop and think before you lose!"

A clever salesman came to our house and wanted to sell us some stock. We then had a few hundred dollars of hard-earned money invested in some good stock. Through our conversation, he learned we had this stock, although I really think he knew this when he came. How, I do not know. He informed us what we held was all or nearly worthless. This was on Saturday around ten o'clock.

He said if we would hurry over to his office and get the deal through before twelve o'clock, as the Stock Exchange closed at that time, he would take our stock for his and do the best he could. It proved to be a deal to get our good stock (I could name it) for his worthless stock.

We made a complaint of this man to our District Attorney, and finally after about three years we received part of our money back. We lost just \$1,000 for listening to a good talker who was a total stranger and by not looking up his reputation. We were glad to get part of the money back; but it was an expensive experience and, had it not been for our District Attorney, we never would have recovered a cent.—Mrs. L. T., New York.

* * *

Star Boarders

I was a widow living in a small town and made my living by keeping boarders. One afternoon a short time ago two men called at my house and told me that they were government men on an inspection tour of boarding houses and hotels. They said they would have to look my place over, which they did, going through all my bedrooms (seven in all), even turning the bedding back to see if it was clean.

They said everything was all right, and then asked me if I could put them up for the night, which I did. They paid for their supper, lodging, and breakfast. As I had two extra rooms, they asked if I would like to take tourists, that there was good money in it, and that they could put me in a position to get all I could take care of.

We talked it over, and I decided to do it. They said I would have to pay them \$10.00 in advance, and they would put a sign on my front lawn, would put my name in a tourist journal, and that I would have all I could care for in a short time. I paid the \$10.00.

They never put up the sign, and I never heard from them again. I wrote to the address they gave me, but the letter came back with the word "unknown" written across it. So I am out my \$10.00, which I could not afford to lose. I hope this may help someone to think twice as I have learned quite an expensive lesson.—Mrs. M. P., New York.

* * *

A "Phony" Agent

"Last November a man called at our farm to secure orders for calendars which would advertise our farm. This agent represented the Gettier-Montanye Company of Baltimore. We never received our order and were notified by the company that this agent was not on their sales force. Could you help us?"

The letter we directed to the agent in question has been returned indicating that he is unknown in Albany. We wish we could help.

The Nicko Wirta family of Sunapee, N. H.

THIS picture was taken quite some time ago. Now the family is grown up, living in different states. Sadness came to this family when father was struck by an automobile and instantly killed. He carried a travel accident policy.

After the death benefit check was delivered to the family, John, a son and administrator of the estate, wrote us, saying: "We wish to express our thanks for the prompt and efficient manner in which our recent claim was handled. The money has been a great help to us. Our whole family carry this North American protection and we highly recommend it to others."

10 North Cherry St., Poughkeepsie, N. Y.

Let Us Help You

THE following Home Service bulletins have been prepared by American Agriculturist's Home Editor, Mrs. Grace Watkins Hackett, and are available to any reader without cost other than 3c each to cover mailing and mimeographing costs:

- ☐ No. 1—OUTDOOR FIREPLACES. How to build them.
- ☐ No. 2—BLANKETS. Selecting, washing, and moth protection.
- ☐ No. 3—APPLE RECIPES. Your family will like these.
- ☐ No. 4—PROTECTIVE FOODS. Good health for the family.
- ☐ No. 5—SCHOOL LUNCHES. Healthful, appetizing, easy-to-prepare school lunches.
- ☐ No. 6—HOME CANNING AND CURING OF MEATS. Directions are easy to follow.
- ☐ No. 7—CHOPPED MEAT RECIPES. Tasty, economical meat dishes.
- ☐ No. 8—BUYING A WASHING MACHINE.
- ☐ No. 9—TEMPTING WAYS TO SERVE EGGS. Excellent recipes for serving eggs as the "main dish" at any meal; also, egg salads and desserts.

How to order these bulletins: Check those you want, include 3c for each one desired, and return this coupon to American Agriculturist, Box 367-H, Ithaca, N. Y.

The basis of a sound business cooperative is voluntary use by fully informed patrons

REMEMBER WHEN YOU "JUST COULDN'T GROW CLOVER"?

Twenty years ago you often used to hear farmers say, "I just can't seem to get clover to grow on my land."

Agronomists and county agents knew what the trouble was. Much of the seed they were getting was imported from Europe and the South—it just wasn't hardy enough to winter through. And in most cases, the soil badly needed lime and superphosphate.

So the clover and alfalfa wouldn't grow, and dairymen were sowing four acres of timothy to every acre of legumes.

The Picture Has Changed

Today, G.L.F. seedsmen estimate that legumes make up half the total purchases for hay seedings each year. With hardy, clean, fast-germinating seed available to every farm in the Milkshed, with the wider use of lime and superphosphate making conditions more favorable for the growth of legumes, more and more dairymen are finding that they *can* grow clover and alfalfa.

In spite of this progress, many seedings are burned out, choked out, or just don't come through each year. And this year, with floods following on the heels of drouth in many sections, the always-present threat of *weeds* is more dangerous than ever.

Beat Out the Weeds

It is an old saying that weeds follow a drouth. In dry years weeds do better than grass; they are often able to head out before the grass crop is fully ripened. Weed seeds with wing-like devices catch in the air currents and are spread to cleaner fields; others are caught in the waters of the spring thaw and are washed under fences into fields that have had few weeds. Many weeds are spread through manure made from weedy hay crops.

Flood waters respect no fences. Weeds spread by water, wind, and roving livestock take an annual toll of three billion dollars from American farmers.

Above. Clean seed is the first step in the war against weeds. This G.L.F. employee is counting the weed seeds in a sample of medium red clover before recleaning. G.L.F. selects seed from fields free of weeds and disease, cleans and recleans to get rid of all noxious weeds and reduce the content of other weeds to virtually nothing.

Cows that get more of their protein in the form of legume hay need less protein in their grain ration. The nitrogen produced in the soil by the legumes benefits the entire crop rotation.

Right. Every lot of G.L.F. legume seed is checked for germination before and after Kem-Fee treatment. This duplicate sample of 100 seeds showed 96 germinating and 4 hard seeds. The fast germination of Kem-Fee treated seeds helps to get ahead of the weeds.

These four steps will help to get the jump on the weeds:

1. The Seed. G.L.F. legume seed is not only thoroughly cleaned to get rid of weeds, but is Kem-Fee treated to thin down the seed coat and speed up germination. Thus the legumes get started and make a stand before the weeds come up.

2. The Seed Bed. Soil must be firm both under and over the seed. Rolling or cultipacking before drilling firms the soil and prevents the drill from sinking in and burying seed too deeply.

3. Fertilization. Many weeds in meadows do not thrive when the fertility level is high enough to permit a vigorous growth of legumes. The importance of supplying enough lime and superphosphate to secure thick stands of legumes **cannot** be overestimated.

4. Cultivation and Rotation. Perennial weeds may usually be controlled through *clean cultivation* of the cultivated crop in the rotation. If necessary, two cultivated crops may be grown in succession. Fall plowing of fields infested with perennial weeds like quack grass is desirable.

DAIRY FEED FORMULA CHANGES

24% Milk Maker. The scarcity of linseed oil meal on the market has made it necessary to eliminate this ingredient in Milk Maker. It has been replaced with coconut oil meal and soybean oil meal. Total Digestible Nutrients increased slightly from 1520 pounds to 1523 pounds.

Fitting Ration. To increase the palatability of this dry feed, 20 pounds of cane molasses has been added, together with 20 pounds of linseed oil meal, replacing 40 pounds of hominy feed and corn meal.

Formulas of the other approved flexible formula feeds remain unchanged. The Super feeds, of course, are not subject to market changes.

Cow Feeds. In the 20% Cow Feed, the linseed oil meal has been replaced by 60 pounds of soybean oil meal, 20 pounds of ground soybeans and 20 pounds of corn gluten feed, increasing the T.D.N. to 1506 pounds. Oat feed has been eliminated from the 18% and 24% Cow Feeds, greatly increasing the T.D.N. (18% now 1478 lbs. per ton, 24% now 1507 lbs.). Although oat feed is too low in feeding value to be recommended for high-producing cows, it has been for many months one of the cheapest sources of digestible feed. It has now become comparatively scarce and is no longer economical.

The Co-op that FARM WOMEN Built

By Mabel Hebel

THIS is the story of a group of farm women who determined to make some money of their own and succeeded beyond their fondest hopes. Back in 1932, when the depression was making it almost impossible to meet taxes, interest on mortgages, and other farm expenses, nineteen farm women in Montgomery County, Maryland, got together and announced their intention of starting a market to sell products of their gardens, orchards, and kitchens.

Husbands, fathers, and brothers were skeptical of the idea, but did not stand in the way.

—Photos Courtesy
Farm Credit Administration.

▲ This unique cooperative market, owned and run wholly by farm women, is located in Bethesda, Maryland, a suburb of Washington, D. C. Starting with almost no capital, it now does a business of over \$125,000 a year.

◀ Inside the neat little frame building which houses the market is a tempting array of good things from farm kitchens and gardens. Many of the women have developed specialties of their own.

After several consultations with the county home demonstration agent and with marketing experts, the women rented a vacant store building in Bethesda, Maryland, a suburb of Washington, D. C. On opening day, they brought a tempting array of cakes, pies, and cookies from their ovens; canned fruits, vegetables, and jellies from their cellars and pantries; flowers from their gardens; also, chickens and fresh eggs. Each woman brought her own display counter, in most instances just a card table.

Advertisements of the opening of the farm

women's market had been run in Washington and local county papers, as well as handbills distributed in nearby residential sections. As a result, buyers flocked to the little market, and long before the day was over, almost everyone had sold out. There was great jubilation in nineteen farm homes that night when the women returned with the story of their first success.

The next week, another sales day was held, more buyers showed up, and more farm women came with things to sell. Again the buyers took practically everything. By Christmas of

that year, these Montgomery County farm women, with the aid of the extension service, had set up a permanent organization, called the Montgomery Farm Women's Cooperative Market, Inc., rented a corner lot in Bethesda, had their present market built for them, hired a manager—a woman—and saw their combined sales (over 60 farm women now belonged) reach the unbelievable sum of \$5,000 a month. The next Christmas, sales had climbed to \$10,000 a month. For several years now, if they fall below that sum, business is considered slow.

The market is open only two days a week—Wednesdays and Saturdays. Members begin to arrive with their goods at 7 a. m., some of them coming a distance of 50 miles. By 8 o'clock, each has arranged her wares on her own display counter, and is standing behind it ready for business. One of the interesting things about this cooperative is that each member sells her own products, collects her own money, and if anything is left over at the end of the day, she takes the surplus home or otherwise disposes of it.

The organization has a board of nine directors, three of whom are elected each year. Besides a Manager, the cooperative hires several other employees. To finance the association, each member pays into the general fund 5 per cent of her sales at the end of each market day, and also pays \$2 a month rent for her counter. Uniform prices for all standard products are set at the beginning of each sales day by a special committee. Another committee sees to it that high quality grades and standards are maintained. This latter committee has been assisted right (Turn to Page 23)

DUTY ONE—Farm Work. During summer, the Ford V-8 hauls hay to the barn and fodder to the silo. It is on the job beside the combine or the thresher handling the grain. In the spring, it takes machinery and seed to the fields. In the winter, it's hauling wood or posts or supplying stationary power. It takes a real truck to handle a load in all seasons where there are no roads. The Ford V-8 can—and does—do it. It's *built* that way from the ground up!

Dual rear wheels and tires, as shown, are optional at extra cost

DUTY TWO—Road Work. The Ford V-8 Truck hauls livestock to market and feed and supplies from town. It takes the cash crop to the elevator and does market hauling for the neighbors. In these jobs, it's *power* in the higher speeds that is important. That means first on the market with produce and back home again early. Fast power for the roads, load-moving ruggedness for the farm—these are important advantages in a Ford V-8 Truck.

THE one *best* place to get a good look at a Ford V-8 Truck is in the driver's seat—your foot on the accelerator, your hands on the wheel, the truck in action. The purpose of the "on-the-job" test, offered by your Ford dealer, is to make this possible. The whole idea is that you take a Ford V-8 Truck and try it out right on your own place. Then you know definitely what a Ford V-8 Truck can do. The "on-the-job" test is yours for the asking—make arrangements for it with your Ford dealer.

PRYING OPEN a Tough Spring

By PAUL WORK

A LONG ABOUT the first of April, people thought there wasn't going to be any spring this year. In our neck of the woods, the ground did not even have bare places to show through the snow but no matter what the weather is like, the sun is powerful at that time of the year. It was only about a week after the first dirt showed up at my garden until I planted a row of peas. That was April 6 and on April 27 they were poking through. It has been cold in the meantime. They probably will not be much ahead of the April 25 planting.

Paul Work

Student gardens were plowed at East Ithaca on the 11th. There was just the one day when this could be done. Monday morning, the ground was frozen three inches thick and it was noon before the ice was all gone, but on Tuesday the land was harrowed and students were planting their gardens Tuesday afternoon, the 16th. If we had done just a little drifting in the matter, the student gardens would not be in yet.

Fresh Manure, Spring Plowed

I suspect I am going to learn something from my garden this year. Since

I was roaming the wild and wooly west in the fall, the land was not manured and plowed. As soon as we could get at it this spring, we gave a huge load of manure to the block which is about 55 feet square, or about a sixteenth of an acre and the manure that went on was right from the stable. It was in good shape but too fresh to suit the old gardening tradition. I followed the plow, raking in the straw. The man at the handles is a good plowman but it is not easy to make a first-class job of plowing under manure on a tiny block with no turning space, so some of the straw sticks up yet. I did put on 30 pounds of sodium nitrate before plowing to help the little bacteria rot down the straw. That was a liberal dose—300 pounds per acre probably being sufficient. Then, we had quite a bit of rain afterwards which would favor decomposition. If we have a dry summer, the land may be a bit droughty . . . but at least, we ought to find out a thing or two. One thing is fairly clear in my mind. Whatever happens, I think I will be back to fall manuring and fall plowing after the leaves drop next fall.

Yesterday, April 25th, I planted three rows of peas: Laxton Progress, Morse Market, and Stratagem. These should give us a nice succession. We do not expect to plant any more, for peas do not stand hot weather. Cabbage, lettuce and beet plants are out. Nothing has grown much because there has been very little warmth so far. **They**

(Continued on opposite page)

Vegetable and Potato Council Helps Growers in Northeast

By ROY PORTER,

Orleans Co., N. Y., Vegetable Grower.

PROCEEDING on the principle that farmers should not ask for help until they have helped themselves, the vegetable and potato growers of the Northeast, back in February of 1938, set up the Northeastern Vegetable and Potato Council. Three representatives from each of the Northeastern States make up the membership. In each case they are chosen by the state vegetable and potato organizations, or if there is no such group, by the State College of Agriculture or the State Department of Agriculture.

It is comparatively easy to set up an organization and not too difficult to lay out a program on paper. The Northeastern Vegetable and Potato Council did that. What is more, they followed it through. Monthly meetings have been held in New York City, and not only has the program been followed through, but it has been broadened to include new activities.

At the start a program was set up to include the following aims:

1. That the same consideration be given to vegetable crops as to any other basic farm crop under the Agricultural Adjustment Program.
2. That land removed from production of other crops in an attempt to stabilize acreage should not be used to increase the acreage of potatoes and vegetables.
3. That the government should discontinue land reclamation and development of new vegetable areas until there is need for them.
4. To continue and extend the plan of surplus crop removal, and to speed up the handling of surpluses of highly

perishable vegetables.

5. That Northeastern States take steps to develop a uniform certification for seed potatoes and vegetable seeds.

As these matters were discussed at monthly meetings, other problems were considered. There was a move to secure more timely marketing information and encouragement of standardization and quality of products and kind and size of containers. Help has been given in campaigns to move unusually large crops to consumers. Encouragement has been given to research and extension work in marketing by state and federal institutions, and the stand has been taken favoring the elimination of speculative credit in growing potatoes and vegetables.

Frank App of Bridgeton, New Jersey, is President of the Council. From New York State the men who have taken an active interest in the sale include: Henry Marquart, Orchard Park; Harold Simonson, Glen Head, Long Island; and Harold Evans, Georgetown. (EDITOR'S NOTE: Mr. Porter, the author, should be included).

New England men who have frequently attended the meetings include: William Carter, Tewksbury, Mass.; Donald Manchester, Bristol, Conn.; G. B. Clarke, Storrs, Conn.; D. A. DeVito, New Haven, Conn.; H. P. Beers, Southport, Conn.; B. F. Trull, Lowell, Mass.; Frank Hussey, Presque Isle, Maine; and John Christenson, Wilson, Conn.

In addition to President App, New Jersey representatives have included: Jack Thornborrow, Millville; Ralph Starkey, Mullica Hill; and A. G. Waller, New Brunswick.

Prying Open a Tough Spring

(Continued from opposite page)
may have a little edge over the ones planted three weeks later but perhaps not much.

Ithaca Roadside Starts Early

When it comes to spring planting, Bruce Millard does not let much grass grow under his feet. He planted peas on April 3rd when there was still plenty of snow to be seen on the hills nearby. At the same time, he sowed seed of lettuce, carrots, radishes, beets, spinach and onion. He now has lettuce and cabbage plants in the ground, which, of course, is considerably later than usual but he expects to plant sweet corn under paper plant protectors immediately. These roadside fellows are great hands to stretch the season at both ends.

* * *

To Plant or Not to Plant

When Joe Robson pokes his head inside my office door, chances are pretty good that I am going to learn something in the next half hour. Joe is in a pretty good position to find out what is going on in the vegetable business.

One of his little statements which appeared in a seed trade paper starts this way: "The vegetable acreage in many sections of New York state depends quite largely on the previous year's prices on fruit and milk." Then, he points out, when apples are cheap in the fall, fruit growers want to plant vegetables the next spring; and the same thing goes for dairy territory. So, he figures that next year there will be lots of vegetables in the fruit sections but fewer potatoes and cabbage in the dairy sections.

Adjustment of acreage according to conditions is a wise thing for people who know their game, provided the variations from year to year are not very wide. I do not believe anybody is wise enough to pick out, in advance, the years when one should or should not plant cabbage. Unless a man is a very close student of crop and market conditions, he will probably do about as well running on a fairly even keel from year to year.

Among the people who make the best jobs of messing up our markets and also messing up their own personal affairs—are the ones who jump in and out of the production of certain crops. Most of these people are not much interested in the crop. They simply want a bit of income. Often, they plant out of more or less sheer desperation. If a person wants to make money on a given crop, he had better work at it consistently, become an expert and build himself some regular year-in-and-year-out marketing channels. There is still room for that kind of growers.

Sweet Corn

The past few years have seen a tremendous increase in acreage of sweet

corn both in Hudson Valley and Central and Western New York territories. Last year, drought and very heavy infestation of corn earworm and corn borer resulted in serious damage. Even so, prices went to the usual low levels of a penny an ear or so. There is not much money in it at that. Joe Robson figured that Long Island and Jersey are declining in sweet corn acreage—not much change in Hudson Valley; the Madison-Chenango country showing some decrease; and Ontario, some decrease. Every unplanted acre, however, is needed to keep production somewhere nearly in line with the capacity of the market. The markets are becoming increasingly intolerant of poor corn—wormy, over-mature or heated. Quality corn grown at low cost plus aggressive merchandising are necessary for success in this field which, like many others, is pretty badly over-crowded.

Cabbage Intentions

Preliminary estimates of intentions to plant cabbage stand at 75,000 acres for the late group of states. This com-

pares with a ten-year average of 77,000 and a 1939 acreage of 72,000. Good prices for the 1939 season are likely to boost plantings. After all, there are enough plants the first of June to greatly increase the acreage. Thus caution is advised against over-planting. Then, the outcome will pretty largely depend upon the weather.

* * *

Knott Goes West

With July 1st, New York vegetable growers are losing the services of Dr. James Edward Knott who becomes head of the Truck Crops Division of the University of California at Davis. Knott received his Doctor's degree at Cornell in 1926, was in charge of Vegetable Gardening at the Pennsylvania State College from 1926 to 1929 when he returned to Cornell as Assistant Professor. Since 1932, he has been Research Professor, giving particular attention to the problems of muckland growers. He has carried many kinds of experiments on the mucklands of the state and has been the leader in the development of types of crisphead let-

tuces for this state which have made marked progress in the last two or three years. He has become well known at meetings. Oswego muckland men are honoring Knott with a dinner early in May.

Are Your Potatoes Hollow?

Hollow potato tubers are a real nuisance to the consumer. In many areas they have meant a financial loss to the grower.

The department of Vegetable Crops at Cornell University is very anxious to learn why potatoes are hollow and how they may be prevented without reducing the size of potatoes. It is important that those regions especially in New York State most likely to be affected in certain seasons be located. Farmers who have found hollow potato tubers or who know they may exist in the crop at certain times are asked to write to Vegetable Crops Department at Cornell University so that some progress can be made toward solving the problem.—Glenn E. Davis.

TAKES A LOT OF PUNISHMENT!

Fewer trips to the gas pump... fewer stops for oil...and Plymouth is built for hard work, a car you can depend on in any weather. Owners say, in every way it's a big money-saver!

BESIDES giving you beauty of design, more room, more comfort, and the smoothness of Floating Power performance—the new Plymouth is exceptionally good to your pocketbook.

Plymouth is famous for saving money. The whole car—frame,

engine, axles, brakes, body—is engineered to "take the gaff."

See the evidence on the 1940 Quality Chart at your Plymouth dealer's—then take the Luxury Ride. PLYMOUTH DIVISION OF CHRYSLER CORPORATION. See the new 1940 Plymouth Commercial Cars!

PLYMOUTH BUILDS GREAT CARS...THAT'S WHY

PLYMOUTH STANDS UP BEST

It's men like him putting the government deeper in debt—always wearing out tools."

THE Editorial PAGE

BY E. R. EASTMAN

Address all mail for Editorial or Advertising departments to American Agriculturist, Savings Bank Building, Ithaca, New York.

"One white foot, buy him
Two white feet, try him
Three white feet, deny him
Four white feet, and a white nose
Take off his hide and feed him to the crows."

This old country saying is reported by Harold W. Thompson in his new book "Body, Boots & Britches". Does anyone know why there was prejudice against a horse with more than one white foot?

Potato Growers Miss A Bet

SUNDAY we had baked potatoes for dinner. The largest one was not over 1½" in diameter, the quality was terrible, and when I mildly complained, Mrs. Eastman said that there were only two or three large potatoes in the peck which she had bought the day before, and that these proved to be hollow. They cost 40 cents a peck. She said further, and with considerable emphasis, that it is impossible to buy good potatoes, that she had tried and tried to buy good New York State potatoes, and that now she was through trying.

Checking this with other housewives in Ithaca, I find the same story. When I have referred to the same subject before in these columns, growers write me that they will be glad to sell me good potatoes. That is not the point! I know there are plenty of good York State potatoes. The point is that it is extremely difficult and often impossible to buy them in many of the smaller York State cities, and I have no doubt that this is true in the smaller cities in other states. Several years ago when living on Long Island I found that we were buying Long Island potatoes after they had been delivered into New York City and carted back to the retail market.

I maintain that potato growers are neglecting local markets right under their noses. The Pennsylvania Farmer points out that the freight rates from distant potato producing areas to Pennsylvania local markets will show that the freight alone is more than the competing growers' cost of producing potatoes in that state. Yet plenty of outside potatoes are sold in Pennsylvania markets.

All of which reminds me of the story of the South African farmer who sold his farm for a song and went away to distant places to prospect for diamond mines. After he had gone, one of the richest diamond mines in the world was discovered on his farm!

The job of realizing the possibilities of these local markets requires some thought and some organization. But it is a challenge to the industry.

The Why of Better Milk Prices

IT IS NO accident that dairymen have been receiving during the winter the best milk prices since the depression. To be sure, they are nothing to brag about now, but they are good compared with the prices farmers are getting for almost any other product.

These better milk prices are the result of just two causes: first, good organization, and second, the milk marketing agreements. After years of fighting among themselves, the farmers' cooperative organizations finally got together in the New York milk shed in the bargaining agencies—the large Metropolitan Agency, with headquarters at Syracuse, the Niagara Frontier Bargaining Agency for the Buffalo district, and later, the Rochester Bargaining Agency for the Rochester area.

The Metropolitan Bargaining Agency asked the Federal and State governments for milk marketing agreements. These were finally submitted to dairymen and approved by nearly 90 per cent. Milk prices jumped. Enemies got busy, brought court actions in the New York milk shed, and the lower courts kicked the agreements out of the window. In New England the courts sustained the marketing agreements.

Following the temporary defeat of the agreements, New York prices to dairymen crashed and I don't need to remind you of the terrible situation dairy farmers went through last spring and summer as a result. But the organized farmers were not licked. They carried the fight to the United States Supreme Court and won, the agreements were restored, and prices to farmers last fall promptly went up and have been good ever since.

To make sure that milk prices would not go down too far again this summer, the Metropolitan Bargaining Agency last winter asked the government for amendments to the agreements that would help to keep prices to farmers up during the surplus period this summer. As a result of this appeal, most of the amendments were granted and submitted to dairymen. You voted for them almost 99 per cent strong! That means that while milk prices this summer will go down some, they will not descend to the ruinous levels of last summer.

It is good to review this history occasionally to remember why progress has been made so that we all will continue to stand for the two principles of organization and marketing agreements which have assured a living price for milk.

Of course the milk problems are not all solved. They never will be. We still have the old one of surplus which will always tend to force down prices unless we can learn to control it. But as long as farmers can stick together, and they and the officers of their cooperatives can keep from quarrelling among themselves, there is nothing that can lick them!

A Good Spring Job

HERE'S another suggestion for a meeting of your farm Board of Directors — Father, Mother, and all the rest of the family.

Discuss the problem of improving the outside appearance of the farmstead. Each member of the Board look over the place and see what large and small things can be done to spruce up. Then assign a clean-up job to each member of your Board.

It is disheartening to ride across the farm country and to see so many otherwise attractive places marred by trash, unsightly wood and lumber piles, and discarded machinery, scattered all about the buildings. Without spending a cent of money, it is possible in many instances to make a different-looking place of your home. After this preliminary job, maybe you can find a little money for some paint which you can put on yourselves.

After all, your home is where you live.

How to Apply Fertilizer

Thousands of dollars worth of commercial fertilizer have been wasted in past years because it was not properly applied.

When applied at the same time as the planting of the seed, it should be placed in narrow bands either on one or both sides of the seed row, and generally slightly below the level of the seed, to

"The cultivation of the earth is the most important labor of man. Unstable is the future of the country which has lost its taste for agriculture. If there is one lesson of history that is unmistakable, it is that national strength lies very near the soil."—DANIEL WEBSTER.

prevent fertilizer injuring seed and seedling plants.

Men Without Skill

A LETTER from a friend, working in a large manufacturing plant, says:

"With employees numbered in the thousands, we now have only about 200 men that at one time worked for this company who are not now back, and I presume they never will get back, as they are men who had absolutely no skill of any kind, and were classed by the company as porters. There are too many of that class of men. Most of their jobs have been filled with men who have at one time been skilled who through old age or partial disability have had to take a demotion, and the company has filled their old jobs with new men. I think there are as many men actually at work in the plant today as there were in 1937, which according to statistics, was the largest manufacturing year that the country ever saw, even beating 1929 on the amount of manufactured goods. Yet in 1937 we had 2,000,000 men out of work in the private industry in this country."

My friend has put his finger on one of the causes of unemployment—men without skill. In these days when everything is done by machines, often complicated ones, it takes brains and skill to hold down a good job even in good times. What a lesson this is to young men who are in such a hurry to get a job and go to work that they will not take the time to complete their education and to acquire skill and training.

Another large cause of unemployment is pure laziness. Some men have been out of work so long that they just won't work. Others will work only when they get the particular kind of a job that they want.

Fun

IF YOU want to have some fun, try this: Take a pumpkin vine after it gets nicely started and trim off all of the branches except the main stalk, leaving one pumpkin on the vine. Cut off the end of the vine and stick it into a bottle or some other receptacle containing skim milk. Put in fresh skim milk every day or two. Then you can fairly see that pumpkin grow. If you follow directions, you'll get a pumpkin the like of which you never saw before, and which will walk away with every prize at the Fair. Perhaps the same idea will work with Hubbard squash.

Eastman's Chestnut

ONE OF the most lovable of all the American poets was Eugene Field. His poetry teems with love for children.

A story is told of Field, in the days when he was finding it hard to support his family of six on his earnings as a newspaper man. During this time his young daughter asked him for a good text to recite in Sunday School. Imagine the consternation of the Sunday School teacher later when little Trotty Field got on to her feet and gravely recited:

"The Lord will provide—my Father can't!"

The Farm Newsreel

TOP — LEFT

John Lyman of Middlefield, Connecticut, was also present, but could not be located when the picture was taken.

BELOW—

1940 New Hampshire Egg and Baby Chick Show. Robert F. Thurrell, owner of Cotton Mountain Farms, East Wolfboro, N. H., receiving from Prof. T. B. Charles, head of the poultry department at the University of New Hampshire, the giant loving cup Mr. Thurrell won as grand sweepstakes prize as the highest total scorer in the egg and chick competition.

SOMETHING NEW IN STANCHIONS — The cows are tied with a chain hooked to a strap around the neck. When they lie down, they can swing their heads in any direction; and when they lunge forward to get up, their shoulders do not strike solid iron posts. When they are standing, the stanchions hold them within relatively narrow limits.

This was an idea of Forest Mathers, Crocker Farms, Cortland, New York, who secured the cooperation of a barn equipment company in making them to his specifications. Mr. Mathers has tried them out, and is enthusiastic about them.

TOP — RIGHT

Harry Fuess of Waterville, Oneida County, New York, spent a good many days during the past spring running seed potatoes over a grader. He grows twenty acres of seed potatoes, and has a dairy of about twelve milking cows. He has been an officer of the Dairy-men's League since it started, and is now serving as County President of Oneida County.

BELOW —

A handy and rapid way of treating seed grain with dust. On the farm of C. J. Baldrige, Kendaia, New York, over 70 bushels of barley were put through this machine in an hour. The machine is run by a small electric motor. Tacked on the door just back of the outfit is an American Agriculturist Service Bureau sign.

USE ESSO FUELS AND LUBRICANTS ON ALL FARM MACHINERY

IT'S REAL ECONOMY to get the best possible work out of your implements. In the case of farm machinery that means using the best fuels and lubricants. And that's why thousands of your fellow-farmers make it a point to buy at the Esso Sign.

Esso fuels mean added power for tough plowing . . . heavy hauling . . . or Happy Motoring. And Esso lubricants give full protection under *any* conditions.

Those are the *two* reasons why Esso products mean big savings. Power and protection. *Power* that saves money by saving minutes—and breezing through the toughest jobs. *Protection* from faulty lubrication and repair bills that often result.

So let Esso Products help you save. Get the right lubricants for your needs. And take your pick of these two new gasolines . . . both winners for economy and power!

ESSO MARKETERS

COLONIAL BEACON OIL COMPANY

New ESSO

Regular in Price, it actually meets premium specifications for anti-knock. A powerful favorite for trucks, tractors or the family car.

New ESSO EXTRA

The finest gasoline ever sold by the world's leading petroleum organization. Absolute tops for extra quick starts . . . extra fast pick-up . . . and extra quiet operation.

A flame torch and an old tire are the best brush fire starters.

Burning Brush

By ED W. MITCHELL

BURNING BRUSH is fun, if you like to do it. If not, it becomes a tedious job. Every orchardist prunes along merrily throughout the winter, accumulating a lot of green brush that must be moved out of the way and burned before spring operations can start.

A brush-pusher hooked on front of the tractor is the best way to move it, and I like to burn it in little heaps as near the point of origin as a missing tree or end of a row offers sufficient space.

In some cases, a lot of little heaps may be left to settle and dry out, or one can start the fire and then bring fresh loads of fuel and push them up on the fire as it burns down enough to avoid danger of damage to nearby trees. One has to be a little careful not to stall the tractor when pushing up on the fire, because it is a poor time to take and a poor spot to choose for cranking; but aside from that hazard it is a good way to handle and pack brush.

Getting the brush to burn was always a problem till we discovered two things: a little flame torch, something like an over-sized plumber's blowtorch; and the inflammable persistency of an old auto tire. If you can once get an old tire to burning, it makes a hot fire and keeps on burning long enough to get the heap well started. The little fire torch furnishes a hot and continuous flame that will start any fire that is capable of starting. These two things, along with the brush pusher, have reduced the time and labor spent on brush to less than a fifth of what it used to take.

I do not dispute the findings of the experimenters who tell us that young apple trees should be pruned as little as possible till they get big enough to bear; and that pruning older trees does not pay, or at most should be done only every other year. They are doubtless right, but I much prefer to run over every tree every year to make sure that they are shaping up right, that broken and diseased wood is out, and that they are thinned out enough to save a lot of hand thinning in the summer when time and labor are at a premium. Pruning every tree a little every year avoids heavy pruning at any time, and should not cost much more than the same amount done every second year. This procedure should also avoid throwing a tree out of balance, as is often the case when a thorough pruning or thinning-out is undertaken.

It is another case where the doctors disagree, and the farmers go ahead and

do the best they can with the time and labor available for the job. It's a good thing we do not have unlimited funds available to go ahead and do all of the things to our farms that we would like to do, or they might end up like my first attempt to cut a man's hair. He had plenty of hair at the start, and I was particularly anxious to do a good job on this first customer and perhaps build up a nice side-line, so I kept trying to trim out and smooth out the stair steps and joggles till the man ran out of hair and had to be finished off with the horse clippers and I ran out of the barber business.

Keeping Apples on the Tree

When apple harvest time approaches, the prospect of a wind storm is very stimulating to the growth of gray hairs. It is a catastrophe when a beautiful crop of apples is blown to the ground, changing them instantly from fancy apples to culls.

Orchardists are going to hear a lot more about a newly developed spray which helps to keep apples on the trees until they are fully colored and in prime condition to pick. This spray contains a material scientists call hormone. It acts on the tissues between the stem and the twig. Fortunately, this spray is not costly, and we anticipate that a considerable number of growers will try it out, at least on an experimental basis, next fall.

The trees are sprayed just about the time the apples begin to drop. On McIntosh trees the effects seem to last about 8 or 9 days, while on some other varieties it may last as long as two weeks or more.

"On your way, wise guys, and no cracks!"

SPECIAL
\$1.50 "Feed Saver"
Hopper
for 89¢

**With Your Order of
Purina Growena
or
Growing Chow**

Plenty of feed hopper space is absolutely necessary in raising good pullets. In order to help you provide lots of hopper space, your Purina dealer is offering the famous all-metal "feed-saver" hopper for only 89 cents, with any purchase of Purina Growena or Growing Chow. This special 89-cent offer is made only during the month of May, which has been set aside everywhere as National Pullet Improvement Month.

The "feed-saver" hopper sells regularly for \$1.50. Its sturdy, all-metal construction makes it far superior to poorly designed and cheaply constructed hoppers. It is rat-proof, holds 25 pounds of feed, and is easy to adjust for different aged birds.

See your Purina dealer today for your supply of Purina Growena, the complete growing feed, or Growing Chow, the mash that goes with scratch grain. Either of these outstanding pullet feeds will help you grow your pullets in the shortest possible time, ready to lay lots of big eggs next fall when prices are high. And don't forget to get your "feed-saver" hoppers while you're at your Purina dealer's store.

LOVELY HAWAII

A YEAR AGO, I told you of adventuring in troubled Europe—particularly of our escape from Albania in one of King Zog's cars, with Italian warships shelling the coasts and deadly bombing airplanes zooming overhead.

This year we visited lovely Hawaii. What a contrast between the restful beat of the waves on the surf-bound beaches of Hawaii and the terrifying roar of cannon farther toward the west in the Orient and across the Atlantic in Europe . . . no shells burst overhead here. Instead the Hawaiian moonlight, shining through the palms—on a peace-loving people, far from the heartbreaks and tragedies of war.

But aside from enjoying the fragrance of flowers and the natural beauty of scenery, I think you will want to know more about Hawaii, just as I did. For Hawaii is actually American soil. In this "I Dare You" column let's become better acquainted with our friendly, fascinating, fellow-countrymen!

AFTER a delightful sea voyage of four and a half days from San Francisco covering 2,091 miles, entering Honolulu was a sight long to be remembered. We had reached "Paradise at the Crossroads of the Pacific." On the clock of the great Tower of Salutation we read "ALOHA." No word in any language has such a variety of meanings. It expresses welcome and hospitality. No other land in all the world, not even far-off Tahiti, gives you such a greeting. It is both thrilling and colorful . . . native singers, the Royal Hawaiian band playing intriguing Hawaiian music. Friends greeting us. Smiling Hawaiian girls throwing over our heads fragrant leis, of variety and color beyond fondest dreams. Mrs. Danforth and our daughter, Dorothy, were smothered in flowers, while my shoulders were weighted down with leis until I looked like a prize Purina-fed bull at a county fair.

Now for a few statistics to fix this part of the United States in your mind: In area, about the size of Connecticut and Rhode Island; population, 400,000—approximately 150,000 of Japanese ancestry, 60,000 Filipinos, 50,000 Hawaiian, 40,000 Anglo-Saxon, 30,000 Chinese—a fusion of races; temperature never above 86 nor below 62—June, the year-round weather. Hawaiian climate is oceanic, not tropical. Sugar and pineapples are the chief crops, the former furnishing one-sixth of our nation's supply and the latter, eighty per cent.

It was hard to realize that we were on American soil; yet Hawaii has been an American territory by act of Congress for forty years. It has the same Federal laws; the same institutions and standards. In every sense Hawaii is America. Hawaiian industry is American industry; Hawaiian sugar and pineapples are American products. This fact was hard to get into my mind when these islands are more than two thousand miles from our mainland. Cotton in the South; wheat in Kansas and Minnesota; corn in Iowa; livestock in Texas and Missouri; dairying in Wisconsin and New York; textiles in New England, and Hawaiian products—all American industry on American soil, all entitled to equal encouragement. Prosperity in all parts of our land means prosperity of our Nation as a whole. I'm frank to acknowledge that I had to go to Hawaii to get this idea implanted in my mind.

While our daughter, Dorothy, learned to dance the Hula and became proficient in surfboard riding, I became interested in the Hawaiian language which has only twelve letters in its alphabet—five vowels, A, E, I, O, U, and seven consonants, H, K, L, M, N, P, W—quite enough for a language which is soft and musical. Note how clearly expressive is KAPU which means Keep Out. My Hawaiian brought many a laugh from my friends. I could never get it straight whether I was a MAHIMIHI—a fish, or a MALAHINI—a newcomer. WIKIWIKI is a word I'm up on because it means "Hurry—Hurry." HANAHANA means "Work—Work." Here's a real one for us young people—HONIKAUA-WIKIWIKI—"Kiss me quick."

It is interesting how English and Hawaiian are mixed up in the ordinary conversation. For instance, the word PILIKIA, which means trouble, is heard over and over again—"He ate some green mangoes and got OPU PILIKIA—much trouble."

My column is filled and I've hardly started to tell you of lovely Hawaii. You at least have caught something of my enthusiasm for these heavenly Islands on American soil. Let me close this first chapter with a prayer carved on the walls of a native church:

"EIA NO AU, E IESU, E,
E NANA OLUOLU MAI"

"Lo, here am I, O Jesus,
Grant me Thy gracious smile"

Say you saw it in AMERICAN AGRICULTURIST.

It's Planting Time . . .

WHERE THE NEED for an emergency hay crop does not become apparent until the middle of May, the logical crops to consider are soybeans, Sudan grass, and millet; or possibly a combination of soybeans with Sudan grass or millet. In using these crops for emergency hay, Professor John Barron of the New York State College of Agriculture emphasizes several points to watch. With soybeans the varieties recommended for hay are Dunfield, Manchou, and Black Eyebrow. If planting must be delayed until late in the season, you can use Cayuga, a variety which is ordinarily grown for grain.

Weed control is especially important with soybeans. This means extra good preparation of the soil and harrowing both before the soybeans are up and until they reach a height of 10" or 12". Soybeans are able to stand a rather severe "going-over" with a spike-tooth harrow.

Soybeans make good hay, although they usually mature at a time when hay-making weather is far from perfect. If too much trouble is anticipated in making hay, the crop can be made into grassilage.

Sudan grass is adapted to well-drained soils, and sowed at the rate of from 15 to 30 lbs. to the acre, will make good hay. Seed should be planted about an inch deep, and the crop is usually put in not later than June 10.

Where land is a little wet, there is some advantage in using a mixture of Japanese millet and soybeans, planted either in rows about 20" apart or in solid sowings. Where a mixture is used, it is not practical to use a spike-tooth harrow after the crop is up because the Sudan grass will not stand this treatment. This makes it important to prepare the soil unusually well before sowing. For row plantings you can use 20 to 30 lbs. of soybeans and from 5 to 10 lbs. of Sudan grass or millet to the acre. For solid sowings use 60 lbs. of soybeans and from 10 to 15 lbs. of Sudan grass or millet.

It is always important when growing soybeans to inoculate the seed.

More About Flint Corn

American Agriculturist has offered five prizes of \$15.00, \$10.00, and three of \$5.00 to flint corn growers. Full details were given on page 6 of the April 13 issue.

Professor Wiggins of the New York State College of Agriculture, who is doing most of the work, tells us that he has had an excellent response to the request for samples of various strains

of flint corn. Letters have come to him from New York, Vermont, Maine, and Massachusetts. Already 17 samples of various strains have been selected for trial, and as letters are still arriving, a few more will be chosen. Corn of the strains chosen will be grown in several areas of different elevations in New York State, and prizes will be awarded next fall on the basis of the best average yields.

There are two very definite ideas back of this. First, it is hoped to find the strain of flint corn best adapted for farmers at high elevations who wish to grow corn for grain. Second, as rapidly as possible it is proposed to develop a double-crossed flint corn which may give heavier yields than any flint corn now available.

From time to time we plan to tell you how the corn is developing and to announce the prize winners after the growing season is over.

Alfalfa Without a Nurse Crop

There are some advantages in seeding alfalfa without a nurse crop some time between June 1 and August 1. This practice allows frequent harrowing during the early summer to control weeds before sowing, and of course removes the competition which a nurse crop gives to the young alfalfa plants.

The important points to remember are that moisture conditions must be favorable, serious competition from weeds must be avoided, and seeding must be done early enough so that the plants will establish a good root system before freezing.

Where a nurse crop is used, it is advisable to make a light seeding, say of 1 bushel of oats to the acre, and to cut the oats from 6" to 8" above the ground to avoid weakening the young alfalfa plants by cutting them close to the ground.

Preventing Scab

Scab on potatoes is most prevalent where a soil acidity test gives a reading of pH 5.45 to pH 7.4. The least scab is usually found where the pH reading is from 4.3 to 5.4. It has also been found that potato scab is more prevalent at elevations between 400 and 1200 feet than at elevations either higher or lower.

In order of susceptibility to scab, from lowest to highest, varieties range as follows: Rustic Rurals, Smooth Rurals, Cobblers, and Green Mountains.

It appears, also, that there is likely to be less scab where potatoes are planted on sod and where they follow potatoes or some other cultivated crop.

"What if he did catch it,—that's no sign I'm out."

Peppers: Ruby King, Ruby Giant, California Wonder, Pimiento, Hungarian Yellow and Hot Long Cayenne. Postpaid 50, 30c; 100, 50c; 500, \$1.50; 1000, \$2.50. Express, \$2.00 thousand. Eggplant: Black Beauty, same price as pepper. Cauliflower: Early Snowball. Postpaid 50, 40c; 100, 60c; 500, \$2.00. Express, \$2.00 thousand.

E. A. GODWIN, LENOX, GA.

Strawberry Plants: Fresh dug, from new plantings, true to name direct from the grower. Prompt shipment. Premier, Dorset, Fairfax, Aberdeen, Dunlap — 100, 80c; 300, \$1.90; 500, \$2.50; 1000, \$4.75; 5000 of one variety \$21.25. Mastodon-Gem (evbr.) 100, \$1; 300, \$2.75; 500, \$4. Figure each variety separate. Transp. Collect. **EUREKA FARM, MAPLE VIEW, NEW YORK.**

MAKE EARLY VEGETABLES. Get top prices. Plant our field grown frostproof cabbage plants. Leading varieties 500-55c, 1000-90c, 5000-\$4.00, 10,000-\$7.50. Will ship C.O.D. Free catalog tomato, onion, pepper and other plants. Prompt shipment, safe arrival and satisfactory plants or money refunded. **OMEGA PLANT FARMS, OMEGA, GEORGIA.**

CABBAGE PLANTS— Millions now ready, also **ONION PLANTS.** Leading varieties \$1.00 thousand; 10,000, \$7.50. Tomato and Sweet Potato plants ready about May 15. List free. Prompt shipment, full count, good delivery guaranteed. Our 30 years' experience your protection. **J. P. COUNCELL COMPANY, FRANKLIN, VA.**

FROSTPROOF CABBAGE PLANTS. Leading varieties, immediate shipment, 500-60c; 1000-95c, 5000-\$4.50, 10,000-\$8.00. Will ship C.O.D. Free catalog tomato and other plants. We are near you—quick delivery, fresh plants, lower transportation. Satisfactory plants or money refunded. **OMEGA FARMS, CAIRO, ILL.**

Certified Raspberries— Taylor, Indian Summer, Marcy, Sodus, Newburgh, Latham, Chief, St. Regis, etc. Strawberries, Blackberries, Asparagus, Grapes, Fruit Trees, Shrubs, etc. All guaranteed. Prices low. Catalog free. **BAKER'S NURSERY, HOOSICK FALLS, N. Y.**

Strawberry Plants Premier, Howard 17, Dorsett, Catskill and Big Joe 80c per 100, \$4.00 per 1000. Mastodon and Gem Everbearing \$1.00 per 100, \$6.00 per 1000. Catalog free. **BASIL PERRY, Route 6, GEORGETOWN, DELA.**

Fresh Dug Certified Strawberry Plants. Premier Dorsett, Dorset, Fairfax, Dunlap, Stevens, Aberdeen, Wm. Belt, 100-80c; 300-\$1.90; 500-\$2.50; 1,000-\$4.75. New Dresden 100-\$1.00; 1000-\$8.00. Trans. Collect. **R. TURNBULL, MAPLE VIEW, N. Y.**

2,000,000 SWEET POTATO PLANTS: Yellow Jersey, Nancy Hall and Porto Rico, \$1.75 per 1,000. **C. E. BROWN, BRIDGEVILLE, DELAWARE.**

CERTIFIED Tomato Plants, Pepper, Cabbage, Onion. Catalog free. **SIMS PLANT CO., PEMBROKE, GA.**

Dairymen's League Members Will Elect Eight Directors

THE groundwork for the annual meeting of the Dairymen's League Cooperative Association at Utica on June 20 is already under way. On May 4, there were membership meetings of all Locals in eight districts where the directors' terms are expiring. Every member received notice of time and place of meeting and the business to be transacted. At each of these meetings a delegate was selected to attend a district meeting on May 6, the chief business of the meeting being to nominate a director for that district.

Each delegate at the May 6 meetings cast ballots equal to the number of members at the meeting which selected him. Each local meeting had the power to instruct its delegate to vote for a certain candidate; to cast part of the ballots for one candidate and the remainder for another; or to allow him to go unrestricted, in which case he used his own judgment.

There has been some loose talk along the line that League officials are a self-perpetuated clique. However, unprejudiced study of the method of electing directors will show, not only that it is democratic, but also that the membership, if they so desire, can in the space of three years elect an entirely new Board of Directors. Naturally it is extremely important for members to attend these meetings so that they can exercise their rights as members of the organization.

This year directors will be elected in the following districts:

DISTRICT NO. 1. Middlesex, N. J.; Somerset, N. J.; Hunterdon, N. J.; Sussex, N. J.; Warren, N. J.; Morris, N. J., and Northampton, Pa.

DISTRICT NO. 3. Rensselaer, N. Y.; Saratoga, N. Y.; Washington, N. Y.; Addison, Vt.; Rutland, Vt.; Clinton, N. Y.; and Essex, N. Y.

DISTRICT NO. 7. Otsego, N. Y.

DISTRICT NO. 9. St. Lawrence, N. Y.; and Franklin, N. Y.

DISTRICT NO. 10. Jefferson, N. Y.; and Lewis, N. Y.

DISTRICT NO. 15. Genesee, N. Y.; Wyoming, N. Y.; Wayne, N. Y.; Monroe, N. Y.; Livingston, N. Y.; and Ontario, N. Y.

DISTRICT NO. 18. Cattaraugus, N. Y.; and McKean, Pa.

DISTRICT NO. 19. Allegany, N. Y.; and Potter, Pa.

The next step in the election of these directors will be membership meetings in all Locals on May 25, where every member will have an opportunity to ballot in the final election of the eight directors. Following the district meetings on May 6, a report of the nominations of directors was forwarded to the Dairymen's League office, where ballots were prepared listing the eight nominees and providing space for members to write in the name of any eligible member of the district if they do not wish to vote for the men nominated by the district.

Following the annual meeting at Utica on June 20, the new Board of Directors will meet and elect its officers and Executive Committee for the coming year.

FOREFATHERS WERE RIGHT

Professors at Pennsylvania State College say our forefathers were right when they stored their smoked hams in the oat bin. Oats, particularly oat flour, checks oxidation in fat-containing foods, such as meats and milk, and therefore helps to preserve them. Card-board milk bottles treated with oat flour help to keep milk from souring. **SLANT:** In reading old issues of *American Agriculturist*, which go way back to 1842, one is constantly impressed with the good farm practices of the old-timers. They didn't always know *why* they did a certain thing, but they knew *how* to get results.

Heads Up... Eyes Front

The Ferguson-Sherman 2-row cultivator follows the front wheels like a shadow. Right . . . left, instantly and accurately, with never a look behind at the shovels.

BEHIND THE WHEEL of a Ford tractor with Ferguson system, you discover that rear cultivation is a grand and glorious fact.

You watch the rows with head up, and eyes to the front. Steer the front wheels *away* from the row, and the shovels move *away* from the row. Steer *toward* the row, and the shovels move *toward* the row. It's like having eyes in the back of your head. You can relax.

At the end of the row, you lift the cultivator with a finger-flip on the hydraulic control, swing 'round on an 8-foot radius, drop the shovels, and you're on your way up the *next two rows*. Every foot of the rows is cultivated to the same accurate depth. The hydraulic control takes care of that. *Effortless* is the word for this kind of cultivation.

This rugged two-plow tractor is so light it

doesn't pack the soil. It works places you've never worked before, with *anything*. Changing implements is actually a matter of one or two minutes. Spreading all four wheels to fit the row width is an easy one-man job.

The place to get the feel of this new kind of farming is right on the seat of one of these tractors. A demonstration on your own farm will show you what *flexible farming* can mean to you.

The Ford tractor with Ferguson system is sold and distributed nationally by Ferguson-Sherman Mfg. Corp., Dearborn, Mich.

\$585 at Dearborn, Michigan. (Taxes, if any, and implements extra.) Ferguson-Sherman 6% simple interest time-payment plan plus small investigation and documentary fee.

Ferguson-Sherman 2-row cultivator. Easily spaced tines; interchangeable and adjustable shovels. Made throughout of special alloy steels. Attached to Ford tractor with Ferguson system in less than one minute.

THE *League* STANDS FOR THE AMERICAN WAY

Farmer Washington
the Father of His
Country

Farmer Jefferson
who wrote the Declara-
tion of Independence

“Life, Liberty **AND THE PURSUIT OF HAPPINESS”**

A AMERICAN FARMERS are the solid rock on which the government and free institutions of this country are founded. Farmers settled America. In every test of its strength since then, they have proved themselves to be solidly on the side of the AMERICAN WAY of doing things.

No demagogue, no rabble-rouser, no labor or radical agitator has ever been able to lure them away from their ancient faith in the rights of free men.

At Concord and Lexington in 1775, they proved that faith—announcing in a volley of musketry that they were ready to defend the AMERICAN WAY with their lives . . . to keep America a free country of free men.

Later at Philadelphia, the free and independent spirit of American farmers spoke out in dauntless tones: “We hold,” they said, “these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are LIFE, LIBERTY AND THE PURSUIT OF HAPPINESS.”

The ringing courage of that DECLARATION OF INDEPENDENCE has never faded from the hearts of American farmers. But it has been lost sight of at times—particularly when its sharp, clear outlines have been fogged over by a haze of arguments, trickery and propaganda.

American farmers, again and again, have lost their right to “life, liberty and pursuit of happiness.” Have lost it, not to enemies who came marching with beating drum

and flying banners, but to men who came with the smile of a friend and the guile of a serpent. Men who said: “Forget your neighbors . . . forget your duty to your fellow farmers . . . just sell us your milk for a little while. And we will pay you well.”

But such promises were always written in sand. They disappeared over-night. Farmers who listened to them and believed them learned to their sorrow that “life, liberty and the pursuit of happiness” are not earned so cheaply. They are won—not by any single farmer working for himself—but by ALL farmers standing together and fighting together in the AMERICAN WAY.

That’s why farmers all over the New York milk-shed banded together in the Dairymen’s League. The League was born out of an undying belief that farmers everywhere are entitled to the rights of their American heritage. That they should be free from oppression and coercion . . . that they should enjoy the right to make their own decisions and to set their own price on the fruits of their own labors. And last but not least that they should bring up their families under the decent standards of living that befit free men.

In every-day life, these rights are best secured for farmers by A LIVING PRICE FOR MILK. And that’s why the League farmers, standing shoulder to shoulder for 20 years, have fought without let-up for A LIVING PRICE FOR MILK . . . for a price that would enable all farmers to enjoy in peace and prosperity their God-given right to “life, liberty and the pursuit of happiness.”

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN’S LEAGUE

Differences in Costs of Fresh Milk and Evaporated Milk

By LELAND SPENCER

DURING the six months May to October inclusive in 1939, evaporated milk retailed in New York City stores at an average price of 6¼ cents per tall can. Since the food value in a quart of milk is equal to that in 1.17 cans of evaporated milk, the retail cost of evaporated milk equivalent to a

quart of fresh milk was 7.3 cents. During the same period of time, Grade B milk retailed out of stores in New York City at an average price of 10 cents a quart. Thus consumers in New York City could save about 2.7 cents a quart by using evaporated milk instead of fresh milk. This is a striking fact when we consider that the store prices of fresh

milk were rather low during the period mentioned, and were about 3 cents a quart less than the price charged for Grade B milk delivered to the doorstep.

How is it possible to sell evaporated milk so much below the cost of fresh milk, even when the latter is handled by the cheapest methods of distribution? I believe that this question is answered to a large extent by the figures given in the accompanying table:

APPROXIMATE MAKE-UP OF THE RETAIL PRICES OF GRADE B MILK AND EVAPORATED MILK AT STORES IN NEW YORK CITY. AVERAGES FOR MAY-OCTOBER 1939.
(Cents per quart of milk or milk equivalent)

Item	Grade B milk	Evaporated milk	Difference
Manufacturers' or dealers' expense and profit:			
Amount paid farmers for milk	4.5	2.9	-1.6
Processing and packaging	1.2	2.3	+1.1
Transportation	0.7	0.6	-0.1
Selling and delivery	2.0	0.7	-1.3
Administrative expense	0.2	0.2	0.0
Profit	0.1	0.3	+0.2
Storekeepers' margin	1.3	0.3	-1.0
Retail price	10.0	7.3	-2.7

The cost of processing and packaging evaporated milk is about 1 cent more per quart of milk equivalent than the corresponding costs on fresh milk sold in glass bottles. But all of the other costs involved in getting evaporated milk to the consumer are less than the corresponding costs for fresh milk. During the period mentioned, the price paid for raw milk at condenseries in the Mid-West averaged 1.6 cents per quart less than Class 1 price in the New York milk shed. In addition to this, the costs of selling and distribution, and the storekeepers' margin on evaporated milk, were much less than the corresponding costs for fresh milk. The transportation cost on evaporated milk was slightly less, even though the product was shipped a distance of 1000 miles or more, while the fresh milk was shipped less than 300 miles to market. Thus, in spite of the low price at which the evaporated milk was sold to consumers, it yielded a much larger profit to the manufacturer than was realized by the dealers supplying fluid milk to the stores in New York City.

It is probable that the advantage enjoyed by the evaporated milk industry as to the purchase price of milk will continue indefinitely, mainly for the reason that production costs are lower in the dairy regions of the Central

West, where most of the evaporated milk is made. More strict sanitary requirements applying to the milk received at condenseries will tend to raise the cost of this milk, but on the other hand, price fixing by public authorities is tending to raise the cost of fluid milk in relation to the prices of manufactured dairy products.

The lower cost of selling and delivery of evaporated milk is mainly the result of delivering evaporated milk to stores in larger loads. This is possible for two reasons: In the first place, evaporated milk is not perishable, and therefore can be supplied to the stores as infrequently as once a week, or even less. Moreover, evaporated milk is distributed to the stores along with other merchandise from the wholesale ware-

houses. It will be difficult for the fluid milk industry to overcome these handicaps. Larger loads of fresh milk could be delivered to the stores provided there was less duplication of service. More general use of paper containers for store milk also would help.

The other main item of difference in costs of distributing fresh milk and evaporated milk is the storekeepers' margin. It is not easy to explain why the storekeepers in New York City accept a margin of from nothing to ½ cent per can of evaporated milk, when they insist upon 1½ to 2 cents per quart on fresh milk. The margin taken on fresh milk is more in line with the average margin on all commodities sold by food stores, whereas evaporated milk is very generally handled as a loss leader.

Jersey Sale at Geneva June 1

June 1 is the date of the Second Annual Consignment Sale of the New York State Jersey Cattle Club at the State Experiment Station, Geneva. In

the morning 20 heifer calves will be sold, and in the afternoon about 40 milking cows and bred heifers.

All animals sold are from herds accredited for TB and free of Bangs disease, and the cattle consigned has been selected by a special sales committee. All of the cows have records of better than 400 lbs. of butterfat, and the bred heifers are from dams with equally good records. Last year at the first sale 35 registered Jerseys sold for an average price of \$155.00.

At 10:00 o'clock Eastern Standard Time, Dr. Glen Salisbury of Cornell will talk on artificial breeding of dairy cattle. All during the morning the Jersey herd at the Experiment Station will be in the barn for inspection, and the results of tests on feeding made by the Station can be observed.

H. C. Andrews of Waterloo, New York, President of the New York State Jersey Cattle Club, has issued an invitation to everyone interested in the Jersey breed to attend the sale.

Note particularly that all events are scheduled on Standard Time.

The Biggest Hit in the 6-foot Combine Field

McCormick-Deering No. 61 Harvester-Thresher

How would you like to cut and thresh your crop all by yourself—or, if you bag your grain, have only one man to help you? It's simple with the low-priced 6-foot McCormick-Deering No. 61 Harvester-Thresher. This great little machine makes combining really practical on smaller farms. It puts control of the harvest right under your thumb, eliminating the threshing crew and keeping the harvest in the family.

This 6-foot No. 61 is a fast-working machine that cuts costs to the bone. It cleans up the harvest at the rate of 15 to 25 acres a day. No matter whether the crop is light or heavy, short or tall,

down or tangled, you can count on the No. 61 for honest-to-goodness grain-saving performance. And it will handle all threshable crops from grains and large beans to tiny grass seeds.

Ask the International Harvester dealer about it.

NORTHEASTERN *Slants* ON THE *National* NEWS

■ House Rejects Farm Labor Amendments

ALL HOPE of getting changes in Wage-Hour Law at this session of Congress vanished last week. After nearly a week of noisy and angry debate, during which House tentatively approved an amendment which would have helped to protect farmers' rights under the law, it was finally voted by House to drop the whole matter and send proposed amendments back to House Labor Committee for further study.

There has been great dissatisfaction on part of farmers and processors of farm products with wage law administrator's definition of term "area of production."

Congress clearly intended a reasonably broad exemption from wage hour provisions for farming in all of its branches, and that "area of production" takes in not only operations performed on the farm but also those necessary to put farm products into marketable form. Administrator, on other hand, has ruled that farm operations done in establishments employing more than 7 persons, or located in towns with more than 2,500 population, or to which products are hauled more than 10 miles, are not within the "area of production." This interpretation has worked hardship to thousands of farmers and to their cooperatives.

SLANT: *American Agriculturist* has consistently and emphatically opposed both the administration of this wage-hour law and the work of the National Labor Relations Board, which from the first has been unfair to farmers and other employers, which means in the long run that it is unfair to labor, too. What agriculture, labor and business most need is a chance to get to work without being constantly hamstrung by laws, and particularly by unfair administration of laws by bureaucrats.

■ Farmers Oppose Patman Bill

HEARINGS before Ways and Means Committee of House of Representatives have been in progress for some time on the so-called Patman Chain Store Tax Bill. This bill, if passed, would put such a heavy tax on chain stores that they would find it difficult if not impossible to continue to do business. If they did continue, they would have to raise prices materially to consumers.

Farmers are particularly concerned with this proposed legislation because they would be seriously affected both as producers and consumers. The chain stores make a large market for farm products, particularly surpluses, and farm families also are big patrons of the chains.

Most of the farm organizations of America have passed resolutions against the Patman Bill, and several other nationwide organizations have appeared at the hearings to ask the Committee and Congress to vote against the bill. At these hearings representatives of farmers have told the Congressional Committee many instances of how both the chains and the independents have taken part in campaigns to increase the sales of apples and other fruits, of all kinds of vegetables, and of milk and eggs, and that therefore the passage of the Patman

Bill or any other tax or restriction on any retail outlet would make it even more difficult for farmers to sell their stuff.

■ FCA Governor Black Accused of Lobbying

HOUSE Agricultural Committee has voted to investigate charges of lobbying against A. G. Black, new Governor of Farm Credit Administration, in connection with circulars sent out by him on April 10 to Land Bank borrowers, asking their opinions regarding proposed changes in the system. Mr. Black's letter to farmers included a reprint of a letter written to him by Secretary Wallace which stated that there was need for farm credit changes, along the lines proposed in the Jones-Wheeler bill, now before Congress.

"If this is the kind of lobbying that we can expect in the Farm Credit Administration under the policies of Secretary Wallace," said Representative Hope of Kansas, "there is every reason to remove FCA from this influence."

Mr. Black's letter was brought to attention of House by Congressman Daniel A. Reed of New York, with suggestion that it might be found to violate statutes which forbid use of public funds to lobby for or against a measure pending in Congress.

Farm organizations are continuing their fight to restore Farm Credit Administration to independent status which it enjoyed before Secretary Wallace took it over lock, stock and barrel. Most of them are solidly behind the Gillette-Kleberg bill, and bitterly opposed to Jones-Wheeler Bill which would destroy the cooperative feature of present Federal Land Bank system.

■ On Congressional Slate

WITH June 1 set as tentative date of adjournment of Congress, legislators in Washington are digging in to clean up unfinished business. In brief, here is status of some important bills still pending:

Farm bill: After House-Senate conference committee failed to compromise differences in bills passed by House and Senate, farm bill was sent back to House. Committee had agreed on items in bill totaling about \$615,000,000, but disagreed on three big items on which House will now have to vote separately. These are \$212,000,000 for parity payments, \$85,000,000 to increase funds for surplus commodity removal, and \$50,000,000 for farm tenant loans. None of these Senate approved items was in original House bill.

Curb on Government Agencies: By overwhelming vote of 282 to 97, House approved Logan-Walter bill, characterized by many as most important measure to come before House in years. Bill has two purposes: (1) to require administrative agencies of Federal Government to have fixed rules of procedure; (2) to permit appeals to the courts from orders issued by such agencies. **SLANT:** There are now 130 federal agencies which can do practically as they please. They interpret laws, make rules which they can change when they feel like it, and issue orders which have the effect of law. National Labor Relations Board is pointed to as an example of one powerful agency whose alleged abuses

Logan-Walter bill seeks to curb.

Relief: During fortnight, President sent letter to Speaker Bankhead asking that the \$975,000,000 relief appropriation requested in his budget message be voted so that all of it could, if necessary, be spent in first 8 months of fiscal year beginning July 1. Critics point out that this would keep relief spending at last year's level until after national elections this fall, and at same time postpone appropriation of full amount needed until a less embarrassing moment. Congress is already face to face with predicament of approving spending that will exceed national debt limit at a time when it is bad politics to levy new taxes or to raise debt limit.

National Defense: Senate has voted 63 to 4 to speed naval construction by appropriation of over \$900,000,000 for fiscal year beginning July 1. House had previously voted slightly larger sum for navy. Still another bill to authorize \$655,000,000 more of naval building is expected to come up for Senate consideration soon.

■ Costly Strike for Farmers

WHEN 6,300 milk drivers in the Chicago district struck for higher pay recently and dealers failed to reach an agreement with them, producers got busy. Through their largest organization, the Pure Milk Association of Chicago, they appealed to the Federal Government to arbitrate the quarrel. As a result, dealers last week agreed to some of the drivers' demands and drivers went back to work, pending arbitration of the rest of their demands.

While the strike was in progress, it tied up almost completely Chicago deliveries of milk. As usual, farmers were the ones to suffer most, and these Chicago district producers lost thousands of dollars a day.

SLANT: Milk drivers in both New York City and Chicago districts make more money delivering milk than the farmers who produce it get for their labor and capital investment. Cost of labor is chief reason for wide spread between what the producer gets and the consumer pays for milk, and these labor costs are constantly mounting.

■ Germany Wins in Norway

NORWAY, Europe's main battlefield after Germans invaded that peaceful land on April 9, seems due for long acquaintance with German domination. After few short weeks of battle, Germans succeeded in completely driving French and British troops out of central Norway. Allies' defeat is expected to result in a patched up peace between Norway and Germany.

French and British troops were at a great disadvantage in Norway because they came late after Germans had grabbed off best air bases and principal ports for landing troops.

Only place in Norway where Allied troops are still fighting is in far north around the port of Narvik, held by an isolated band of German soldiers.

■ Dairymen Plan Self-Help

FORMATION of a national organization to execute plans for National June Dairy Month campaign have just been announced. Heading executive committee is Charles W. Holman, chairman of National Cooperative Milk Producers Federation. On committee

The Chance of a Lifetime

By E. R. EASTMAN.

MANY years ago William H. Danforth, who writes the "I Dare You" column in *American Agriculturist*, conceived the idea of establishing a camp to train young people in the principles of leadership. Under the name of the American Youth Foundation, camps were established at Shelby on Lake Michigan and at Merrowvista in New Hampshire. Here each summer for many years have come a group of selected young girls for two weeks of intensive fun and training. This is immediately followed by another two weeks for younger boys, and then by two weeks for older girls and two weeks for older boys.

It has been my privilege to visit Camp Miniwanca twice, and see it in operation. I have never seen a finer group of young people, and I doubt if it would be possible to crowd more fine things into two weeks than is done at these American Youth camps.

So enthusiastic are we of *American Agriculturist* about what these camps do for young people that for two years we have paid the expenses of a young man, selected from the Northeast, to have the benefit of this grand and glorious two weeks training. We will do the same this year. If you are a young man between the ages of 16 and 21, and are interested in having the most fascinating two weeks' experience of your life, write me a letter, giving your age, your school record, your experience as a leader in the community, that is, what you have done in 4-H, Young Farmers Club, or as a Scout, what part you have taken in church or in other community life, what are your plans in life and what you are doing to prepare yourself to carry out those plans. Give several references of people to whom we can write.

From these letters, and from other information, we will select a young man to go to Camp Miniwanca this summer.

Address letters to E. R. Eastman, Editor of *American Agriculturist*, Box 367, Ithaca, N. Y.

will be representatives of every branch of dairy industry, as well as of various food distributors, including chain stores, independents, and druggists.

In announcing set-up of new organization, Mr. Holman said there is a special need this year for self-help, with milk production bidding fair to be greatest in history of United States.

"Producers," said Mr. Holman, "believe that a campaign of this kind will be productive of great good and that the various agencies participating will be able to make a demonstration of what team work can do to remove surplus dairy products from the market at the time of the highest seasonal production."

Cooperating in dairy drive will be producer committees and producer cooperatives all over the nation, working with distributors, food stores, drug stores, variety stores, restaurants, hotels and railway dining-car services.

■ Farm Income Up

FARMERS' cash income, reports U. S. Dep't. of Agriculture, was 12 per cent higher for first quarter of 1940 than year ago. Income from farm

marketings for January, February and March amounting to \$1,696,000,000, plus government benefit payments of \$291,000,000, made a total of \$1,987,000,000.

However, month of March this year did not do so well by farmers as it did last year, nor as well as first two months of this year. Decline in March receipts, says U. S. D. A., resulted from weaker consumer demand for farm products, lower prices for several agricultural commodities, and a smaller amount of corn placed under government loans.

One indication of farmers' better cash income is seen in sales of farm implements, which are running 15 per cent ahead of last year.

Things are also looking better on other fronts, particularly for automobile industry. Also, more people are building — always taken as a good sign of better business weather.

■ Farms More Efficient

LAST year, American farmers supplied the needs of from 50 to 70 per cent more city folks than they did thirty years ago, said Louis H. Bean, of U. S. Dep't. of Agriculture, testifying before Temporary National Economic Committee. Improved farming practices, better meat in livestock breeds and better crop seeds, as well as the coming of the machine age, have all played their part in increasing farm productivity, declared Mr. Bean and other witnesses.

One witness, Sherman F. Johnson, testified that new machinery on farms has almost completely eliminated opportunities for seasonal employment in wheat fields. The tractor and the combine, he said, permitted the wheat farmer in 1939 to produce his crop with half the labor used per acre in 1909. A table offered by Mr. Johnson showed that tractor operation on a 320-acre Kansas farm reduced the need for a hired man from 90 days a year in 1920 to 10 days in 1939.

Two other effects of widespread use of tractors, said Mr. Johnson, are a decline in country's horse and mule population from 25 million in 1920 to 15 million in 1939, and a tendency of farmers to buy or rent extra land to keep down overhead by using tractor's surplus of available year-around power.

■ Butter Has "Something"

UNIVERSITY OF WISCONSIN scientists have recently discovered that butterfat possesses a mysterious "something," in addition to known vitamins, which produces better growth and better health than other fats — sort of a secret formula devised by nature.

In the experiments conducted at Wisconsin, animals were fed skimmed milk with added fat. One group got skimmed milk with butterfat. Another skimmed milk with corn oil. Coconut oil, cottonseed oil, and soybean oil were other fats used in the experiments.

All of the known vitamins which are present in butterfat were added to each of the other fats in the same amounts, but in spite of this the animals on the butterfat diet grew stronger, were sleeker in appearance, produced more and healthier young than animals fed the vegetable oils. Marked difference between the animals on butterfat and the others was seen within short time of three weeks.

■ Go to Grass!

IF SOMEONE tells you to "go to grass", he is giving you sound advice, according to American Chemical

Society. At a recent meeting of the Society a report was presented by three Kansas City, Mo., scientists revealing their discovery that grass contains more vitamins than all other plants and fruits put together.

These scientists say that it takes 340 pounds of fruits and vegetables — more than the average person eats in a year — to provide as many vitamins as 12 pounds of dried grass. To make vitamins in grass available to human beings, science has developed a quick-drying process, after which the grass is powdered and sealed in special containers.

You can get the same vitamins in expensive pills, say the scientists, but the grass powder can be made much cheaper and can be added to common foods.

Good Books to Read

Dead Ned

John Masefield

As fantastic a tale of adventure and misadventure as you could wish to read. Ned Mansell, a young doctor, wins the friendship of an old Admiral, of whose murder he is later unjustly accused and sentenced to be hanged. The sentence is carried out, but through the efforts of some of his medical friends who believe in his innocence, Ned is revived after the hanging and shipped out of the country on a slave to begin life anew. The McMillan Company, New York. \$2.50.

Live and Kicking Ned

John Masefield

But the author did not leave our hero in such an unsatisfactory situation. After much trouble Ned reaches his destination, the Coast of Dead Ned, journeys inland to find beauty, romance, and new adventure in the heart of Africa, and

returns to England as the Envoy of an ancient nation. But in the eyes of English law he is still an escaped felon, and again he has to fight his way through false rumors and treachery to peace and fortune at last. The McMillan Company, New York. \$2.50.

Good Movies to See

MY SON, MY SON. The ambitions of two fathers for their sons were along entirely different lines, and the effects upon the characters of the boys equally so. Brian Aherne, as William Essex, dominates the picture, from a poverty-stricken young writer to a successful and fashionable novelist. You will love and sympathize with him, and at the same time blame him for his son's selfishness and vanity, inspired by his own pampering. In contrast to the constant upheavals in the Essex household is the family love and devotion of the O'Riorden family.

You'll take more pride . . . more comfort . . . more pleasure . . . in owning "THE LONGEST OF THE LOT"

THE VERY LONGEST OF ALL LOWEST-PRICED CARS

From front of grille to rear of body — for length where length counts — Chevrolet for '40 out-measures all other cars in its field!

You want your money's worth when you buy that new automobile! . . . You want *the longest of all lowest-priced cars!* . . . You want a big, roomy Chevrolet for '40 — measuring 181 streamlined inches from front of grille to rear of body!

You'll get a lot more pride out of ownership of this car, because its extra length, like its New "Royal Clipper" Styling and Body by Fisher, means extra beauty, extra richness, extra luxury.

You'll get a lot more comfort out of it, too, because its extra length also means extra riding-smoothness over all types of roads.

And you'll also get a lot more pleasure, because, in addition to out-measuring all other lowest-priced cars, Chevrolet out-accelerates, out-climbs and out-performs them, too.

The best proof of these extra values is that Chevrolet is winning more buyers than any other motor car, for the ninth time in the last ten years! Better eye it — try it — buy it — today!

By J. F. (DOC.) ROBERTS

THE BIG live stock news of the week is that hogs have come up out of their ruinously low price. They are now bringing better than \$7 per cwt. in Buffalo, which is an advance of over \$1 per cwt. from the low time. This advance has long been delayed, and a good many people in the industry feel that it has been unnecessarily long because of large, centralized buying by both wholesalers and retailers to keep pork prices down. This advance in hogs should tend to help all live stock prices. Even though they are still too low, they probably will continue to work higher, particularly if they do not carry too much lard and do not weigh much over 200 lbs. alive.

* * *

Wool is also better, being 2c or 3c a lb. higher, and in my opinion it is still the best gamble on the farm to hold for better prices. It is encouraging to see groups of wool producers themselves get together as they have this year in New York State, and work out ways and means of improving their wool merchandising and selling. Prices are now running around 36c or 37c for the coarser and longer stapled wools, on down to around 25c or 26c for fine, shrinking, short-stapled wool. Both these classes will undoubtedly go higher.

* * *

I have often spoken of big cows and big calves, and why shouldn't I when Bob Hinman, the popular cattle man at Cornell University, marketed a cow in Buffalo the other day that brought \$106.57? On that same day, he marketed a steer that brought \$11.50 a cwt., with total money of \$113.85. This very narrow difference in total money was because the cow weighed 1470 lbs. and the steer 990 lbs., but when anyone can salvage a cow that will bring over \$100, the dairy business is in a good position. At the present time, a

You can CHECK COLLAR GALL while the horse is working

Rub Absorbine well as soon as swelling or irritation is noticed. Apply Absorbine each day before and after the horse is worked. Be sure that the collar is not torn or lumpy, as this will continue irritation.

Absorbine's fast action relieves the soreness. Speeds the blood flow through the injury—opens up small blood vessels, clogged by collar pressure, so blood flows more freely, washing out impurities, relieving soreness. The swelling often goes down within a few hours.

Absorbine is not a "cure-all," but it is most helpful in checking windgall, curb, bog spavin and other congestive troubles. Helps prevent them from becoming permanent afflictions. \$2.50 the long-lasting bottle at all druggists or postpaid W. F. Young, Inc., Springfield, Mass.

SALESMEN!... SELL ROSS METAL SILOS

Produce more and better ensilage... Save it all... No loss from fire, freezing or leakage... Withstand worst windstorms and weather.

ROSS Equip't Co., 240 Warder St., Springfield, Ohio (Profitable territory still available)

200 lb. veal calf will bring \$23 on our market. More of such cows, steers and calves would change the agricultural outlook of the Northeast, and it is not impossible. * * *

Canada has shipped into the U. S., and sold on our Buffalo market alone, almost 4000 cattle in the last three weeks—to be exact, 3,903 head. This is hard to understand, when a warring country, apparently in need of food, exports anything like this amount of cattle into a country which is spending millions of dollars to remove surplus foods from its markets, and endeavoring to re-establish parity prices for agriculture. * * *

Horses are still cheap and, while the late spring is putting pressure on all of us, an April and May without dry weather makes a hay crop as well as pasture. Therefore, do not sell horses short. They are too valuable an asset, particularly to our Northeast farms.

Less Sheep Killed by Dogs

A REPORT issued by Mr. Merton Reynolds, Supervisor of dog Licenses in the New York State Department of Agriculture and Markets, shows that during 1939 marauding dogs destroyed livestock as follows:

	Killed	Injured
Sheep and lambs.....	6,601	3,017
Cattle	169	263
Swine	145	38
Fowls	31,089	787

There were 10,183 more dogs licensed in 1939 than in 1938, with an increased revenue of \$20,997. The number of sheep claims decreased by 1,014, while poultry killed increased by 1,403. The amount of damage was much less than in former years. Figures do not include New York City and Buffalo, which have a separate service.

Dog licenses are issued by all town and city clerks, also by clerks in the incorporated villages within the counties of Nassau and Westchester. With the exception of 10%, all money collected remains in the county in which the collection is made. Ten per cent is sent to the Department of Agriculture and Markets to cover expenses chargeable to the State, including licenses, tags, printed supplies, etc. The total amount collected in New York State amounted to \$1,038,999. Of this the cities retained \$151,198, which fees are shared between the city, county, and state. The 10% State share amounted to \$103,383. The remainder of the licensing fees becomes a fund in the hands of the county treasurer, for the purpose of paying owners whose domestic animals and fowls have been injured or killed by dogs, also for paying expenses for enforcement of the law within the county. Mr. Reynolds reports that for the first time since 1925 each county had sufficient funds to meet all claims.

Damage from dogs was one of the reasons why the sheep industry left the Northeast. By the same token, better control of dogs will help to bring sheep back to our eastern hills.

A Great Holstein

One of the great Holstein cows in the country is Cornell Ollie Pride, bred at the New York State College of Agriculture. This cow was named as All-American Three-Year-Old and World's Champion Senior Two-Year-Old. Cornell Ollie Pride is now ten years old, and recently made a record of 21,068 lbs. of milk and 862.4 lbs. of butterfat.

The State Conservation Department has listed 94 New York State residents as ineligible to secure hunting licenses for periods ranging from 1 to 10 years. In most cases the refusal to grant licenses was due to involvement in hunting accidents, although a few were a result of repeated violations of the conservation law.

We'll do your Milking FREE!

Your Universal dealer will loan you one of these new "1940 Sensation" milkers to try. You'll like it because it's newer—faster—cleaner—and easier to operate.

Universal Portable MILKER

The only Portable Milker with ALL of these Outstanding Features:

- Famous alternating action—like milking with hands.
- Milks with LOW VACUUM.
- Uses inflation-type teat cups.
- Milks directly into milk can or milker pail.
- Milks one or two cows at a time.
- Compact. No belts or pulleys. Operates with a 1/4 H.P. motor from any light socket.

From START to FINISH

Under modern methods of turkey management dry skim milk in the ration is just as important as it is in chicken feeds. From start to finish it helps to meet Nature's special demands.

There is need for higher protein and higher vitamin content in turkey feeds than in chicken feeds. With this is the important need to restrict the calcium and phosphorus content, if disastrous slipped tendons are to be avoided. Such a situation calls for careful formulation.

Consider minerals in two ways: The minimum amount necessary for feed efficiency and the maximum amount allowable to avoid trouble. This problem is readily solved when dry skim milk is used. It contains essential minerals in moderate amounts but in highly assimilable form.

Write for Bulletin 212E on "Turkey Mashers." Ask questions, if you wish. It pays to use dry skim milk.

Mr. Van Vleet with two of the pullets that are being trapnested for next year's breeding flock.

Fifty Years a Poultryman

By H. L. COSLINE

FIFTY YEARS AGO William Van Vleet of New Hartford, Oneida County, New York, began in a small way to raise chickens. That's a long time, during which revolutionary changes have occurred in the poultry world. By keeping abreast of these changes, and sometimes a step ahead of them, Mr. Van Vleet has developed a good sized poultry business as I found when I stopped in at his farm recently.

First, we took a little tour of the buildings. The main laying house holds 1,800 hens on one floor. Under it is a basement with incubators and a good sized room for handling and packing eggs. Above the hens is a room with space for about 2,000 chickens. As we stepped in, I noted four brooders. Two were operated by electric current and two used coal for heat.

"Which do you like best?" I asked Mr. Van Vleet.

"I see little difference," was the reply. "In fact, I like a combination of both. The coal stoves keep the room warm so the electric hovers use less current."

The floor had a liberal covering of shavings which Mr. Van Vleet says he likes about as well as any litter for chicks.

Close by is another building, formerly a barn, in which three floors have been fitted up for hens with a capacity of 1,400. A third, somewhat smaller building, houses 400 breeders. The first pen we entered carried 150 pullets.

"These," said Mr. Van Vleet, "are being trapnested, and about fifty of the best ones will be picked out to add to the breeding flock which you see in the other two pens."

"How long have you been trapnesting?" was my next question.

"About fifteen years."

"What is the best record you ever made, and what standards does a pullet

have to meet before she is put in the laying pen?"

"The best record any hen of mine ever made was 317 eggs. I never put a pullet in the breeding pen that hasn't laid at least 225 eggs in her pullet year, and most of them have laid 250. Of course, when I select pullets for breeders, the trapnest record is important, but they must also meet other requirements of health and vigor and they must be good representatives of the Leghorn breed."

Of course, a business of this size does not just happen. Neither did Mr. Van Vleet start at the top. About forty years ago he was keeping 300 hens. When incubators were developed to the point where they were practical, he purchased one, thus cutting out a good many headaches he had previously had in hatching chicks under hens. He then increased the flock gradually, until about ten years ago he was keeping 2,000.

Differences of opinion are what make any business interesting, and one new development which Mr. Van Vleet has not adopted is that of keeping birds confined. His layers are out on range all during the summer, and his chicks are reared on alfalfa sod, occupying any particular range only one year out of five. He hatches around 40,000 chicks each year.

Until about fifteen years ago, Mr. Van Vleet mixed his own feed; but along with other revolutionary changes in raising poultry, colleges and experiment stations developed a lot of information about feeding hens. Deciding that feed manufacturers were in a better position to take advantage of this new information than he was, Mr. Van Vleet began to purchase ready mixed

(Continued on Page 19)

The main laying house has room for 1800 layers.

"How I Clean and Pack Eggs"

An Egg Cleaner

Each morning I clean and pack my eggs which have been cooling in wire baskets since they were gathered the day before. I use a patented cleaner which handles six eggs at a time, held in place and slowly revolved by three rubber rollers. Just beyond the rollers is a high-speed revolving cylinder containing abrasive loops which contact the eggs. The loops are loosely hung on fiber rings which, in turn, are hooked to the cylinder in such a way that they can move freely.

As the cylinder revolves, the centrifugal force throws the loops out away from the fiber rings, and as they strike the egg, they are cushioned on the air between the loops and the rings, doing a thorough job of cleaning with practically no breakage. The friction between the egg and the loops causes the loops to revolve on the rings, thereby using the entire abrasive surface. The cost of cleaning by this method ranges between three and four cents per case.

The cleaner sits on a table directly in front of the operator, with the basket of eggs on his left. To the right on another table, I have a popular make grader which rolls the eggs down a track until they reach a spot where they are heavy enough to overbalance the counter-weight and roll into a rubber tray. The eggs are taken from the basket and the clean ones are put on the grader. The dirty ones are put through the cleaner before grading. They are taken from the grader and packed in cases which sit under the table in front of the operator.

This system has cut my egg packing time about in half.—*Frank E. Prior, E. Nassau, New York.*

* * *

Clean Nests Mean Less Washing

The first important item is clean nests, and the second is clean floors—prevention of dirt! As I gather the eggs, I put the dirty ones in a basin of cold water and leave while I attend to other duties. Most dirt will rinse right off, but obstinate dirt I brush off with a vegetable brush, rinse, drain on crate fillers, with the points down.

I keep eggs in baskets; they cool better. When ready to sort, I sit on a foot high stool, surrounded by crates and baskets, with the scales in front, and sort. I can sort a hundred dozen, and visit with the family or a chance caller or listen to the radio. That's all there is to it. Simple, isn't it?—*Mrs. Frank Barrett, Ballston Spa, N. Y.*

* * *

A Handy Arrangement

I have a small table about two feet square and high enough so I can work comfortably at it. On each side of the table there is a shelf which is about 10" from the top of the table. These shelves are fastened to the legs of the table by iron brackets.

The eggs which have not been cleaned are placed on the right shelf and empty cases on the left shelf. Beside these are two orange crates which are on the floor, one on either side, which hold other baskets for other grades. All baskets are labeled—extra large, large, medium, pullets, peewees, and cracked and unsalable. I have on the table a newspaper. On this I have scales, candler, a basin of water, two colanders, and a can of cleanser. I also have a piece of brass called a

brownie which can be purchased at any 5 and 10. This I use to take off all surplus dirt. Then I wash with clear water, and if water will not remove all stains, I try cleanser; then wash and lay in colander. I continue until all have been taken from the basket of uncleaned ones. By this time the first colander full will be dry or nearly dry. I have a towel I use to wipe them if they need it.

Then I weigh, candle, and place them in their respective baskets; after which they are set on the cellar floor ready to be packed.—*Miss Sophia Ollwick, Black River, N. Y.*

* * *

Gather Eggs Frequently

I gather my eggs at least three times a day. That is the first point in cleaning eggs for then there are fewer broken and cracked ones in the nests to make them dirty. Then I put them in a cool, damp cellar. When they are thoroughly cool, I clean them, for if

they are left to stand, it is very much harder to clean them. I always use No. 1 sandpaper to clean them.

When they are cleaned and graded, I case them up each night and leave them in the cellar until the truckman comes after them. I always receive a premium of from 1 to 1½ cents a dozen for my eggs.—*Mrs. Chester Wheeler, King Ferry, N. Y.*

* * *

Keep in a Cool Place

I gather my eggs at least three times a day and let them stand over night

in a cool place. The following morning I get them ready to put into the case. If any of the eggs are dirty or stained, I take a damp cloth and rub them off. If the stain does not come off readily, I sprinkle a little cleanser on my cloth and the stain will disappear.

I grade them into large, medium and small grades. The small eggs I use at home. When I put them into the case, I put the small end down so the yolk will not settle out of place. The eggs are kept in the cellar where
(Continued on Page 18)

Governor Signs Bill on New Poultry Terminal

Governor Lehman has signed the Coudert Bill which was passed by both Senate and Assembly near the end of the session. The Bill concerns a new poultry terminal to be built in Long Island City.

For some years there has been dissatisfaction with the crowded conditions at the poultry terminal at the West Washington Market, and after several committees had been appointed and several plans proposed, the New York City Government passed necessary legislation to erect the new terminal and lease it to a private operating company. However, before it could be started, some state legislation was needed, which in the form of the Coudert Bill has now been passed. It

is expected that work on the terminal will begin soon.

Near the end of the session, when it seemed possible that this Bill would not secure the proper action, the editorial staff of *American Agriculturist* called the situation to the attention of various key poultrymen and poultry organizations. Many of them wrote to their Assemblymen and State Senators urging the passage of this Bill, and we have been informed that this interest taken by poultrymen in a problem which would mean money in their pockets had a great influence on the ultimate passage of the Bill. Naturally we are pleased that we were able to perform this service for the poultry industry of the Northeast.

"How I Clean and Pack Eggs"

(Continued from Page 17)

It is cool while the case is being filled. I have nearly a hundred hens. It only takes a few days to fill a case, and they are soon on their way to market.—A. L. Wesche, Angelica, N. Y.

* * *

Keeps Grades Separate

The nests in our plant are kept filled with clean shavings and the litter on the floor is reasonably clean. Eggs are gathered at least three times daily, so there are few dirty eggs, but all need careful inspection.

Taking a comfortable stool at a table near a window I proceed as follows: I have a square of old bath towel 8 or 9 inches square. Half of this is dipped in water and wrung dry as possible. The cloth is not WET, just damp. Holding the cloth in my left hand with the corners hanging down I place a soiled egg on it with the right. Many times it only needs rubbing lightly with the dry portion of the cloth.

If the egg be really dirty I first scrape it with a small flexible knife, then rub with the damp corner of cloth and wipe dry. I have at hand a small dish holding vinegar. If an egg is stained the stain can be removed by applying a drop of this, using the same cloth. Badly stained or dirty eggs are horticultural manufactures.

Twice each week the eggs are graded, using egg scales. They are packed small end down in good crates, using clean flats and fillers. When possible, only one grade is packed in a case. If, however, it is necessary to put more than one grade in a crate each is placed by itself and is clearly marked by a piece of paper above the filler "This end containslarge,medium eggs."—Frances Hayes, North Pitcher, N. Y.

Home Canned Chicken to Increase Poultry Income

Hint to wives of Massachusetts and New England poultry farmers, looking for a way to supplement the income from eggs and dressed poultry, is to consider canning chicken for sale, according to John A. Clague of the Massachusetts State College department of horticultural manufactures.

Two-year old fowls are the best birds for canning says Dr. Clague. Young birds may be canned, but the texture and flavor of the meat is not equal to that of mature birds. Old roosters should not be canned for sale.

Bones or Boneless — Chicken canners may choose between two methods of packing, either with bones or without bones. Chicken canned on the bones may be used in more ways than boneless meat, for it can be fried, or it can be removed from the bones and used as boneless meat. Also, some persons claim that meat canned on the bones has a better flavor. The chief advantage of the first method is that a pack of chicken canned on the bone is not so attractive as the boneless chicken—and "eye-appeal" must be considered in selling food products.

On the other hand, Dr. Clague points out that boneless chicken requires more time and labor in packing than chicken canned on the bones. Some home canners put out both types of canned chicken, as well as two or three sandwich spreads, and a variety of soups and broth.

EXTRA PAY FROM THE KERR LAY

Smart poultrymen demand Kerr quality. They know Kerr layers produce heavily. Kerr breeders are rigidly culled, banded and blood-tested—checked for strong, vigorous ancestry. A 32-year breeding program and a 240-acre breeding farm is your assurance of high productivity, high profits. Write for Free Literature and Advance Order Discount

Fifty Years a Poultryman

(Continued from Page 16)

mash and has done so since that time. For about fifteen years, also, he has been feeding semi-solid buttermilk.

"The hens are very fond of it," said Mr. Van Vleet, "and in my opinion it is a great aid to hatchability. While some people think that it is important, I make no attempt to supply green feed to the flock."

It is a real job to build up a high producing flock of hens; but after this is done, there is another job to be done—namely, to sell the product.

"All of the eggs from this farm are sold to stores in Utica," said Mr. Van Vleet. "I gather the eggs several times a day, and every one is candled and graded. I deliver them to the stores twice a week, and get paid the highest market price for white eggs. I never have any trouble selling them that way—in fact, I could sell more if I had them."

"If you were advising a young man just starting in the chicken business, what fundamentals would you stress?" I asked.

Mr. Van Vleet thought a few moments before answering, and then said:

"First, I would stress the importance of starting with healthy stock. Even then it takes plenty of attention to keep them healthy and free of disease; and that is not enough. In addition to being healthy, a flock of hens must have the inherited ability to produce heavily. It is my opinion that any poultryman, production of whose flock is below average, is going to have tough sledding. "Second, it is important to house them properly. In my opinion, two important requirements for a hen house are insulation and ventilation. Insulation tends to keep the house warm in winter and cool in summer. A system of ventilation that works gives the birds plenty of fresh air and keeps the house dry during the winter.

"The third essential is good feeding—taking advantage of all of the new information that has been developed in recent years."

I suspect that Mr. Van Vleet has developed a good many other wrinkles in poultry keeping that have added to the development of his farm; but certainly if any young fellow just starting out in the business will follow the fundamentals he has outlined, he will go a long way toward avoiding a good many headaches.

"Throat trouble got Pop—he crow-ed too loud!"

Wonderful Success Raising Baby Chicks

Mrs. Rhodes' letter will no doubt be of utmost interest to poultry raisers who have had serious losses raising baby chicks. Read her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks so thought I would tell my experience. My chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Company, Waterloo, Iowa, for a 50c box of Walko Tablets. They're just the only thing to keep the chicks free from disease. I raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

—Mrs. Ethel Rhodes, Shenandoah, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

Warm Weather Clothes

by
MRS. GRACE
WATKINS
HUCKETT

THE WISE WOMAN gets ready before that first burst of hot weather sends the whole family scurrying for crisp, cool clothes. This season there are such pretty dresses that it is fun to make them.

Cottons and linens take the lead, but spun rayon and even sheer woolens have plenty of opportunities in the wardrobe. Cottons run to ginghams, piques, embroidered, wide wale and otherwise, seersucker in many fancy weaves, Javene prints, novelty denims, awning stripe chambrays, and reverse stripe poplins for the sport type of clothes.

For afternoon and evening wear there are mercerized lawn, mull, shadowstripe sheer, patterned organdies, crease resistant voiles, embroidered batiste, permanent finished muslins; swiss, dotted or embroidered and with relief pattern effects; nets, dull pastel laces and sheer chiffons.

Linens are also important, appearing in interesting prints and weaves. White linen suiting often in herringbone weave, is popular for coats to be worn with casual or dressy dresses. The yarn dyed fancy linens for sportswear are often planned for easy matching into a "companionate" outfit. Stripes and a great many variations of checks are everywhere. The simple stripes are used for active sports, the fancy stripes for daytime, the bold, colorful, patterned stripes for evening.

As for silhouette, the waistline is slim and well defined. The bodice has lengthened to form the new long torso. Often this is achieved by a flat hip yoke with flaring skirt attached. For active sportswear, the skirt swings freely. Incidentally, the skirt gets no longer—shorter if anything. The blouse also should allow plenty of freedom for sportswear.

Summer colors emphasize natural and white, often on green. Other color combinations are red and white on

gray, pink on blue. Natural with cocoa and bamboo beige relieved by bright green are other possible color combinations. The so-called South American colors are vivid and particularly suited for active sports. A color combination much seen in southern resorts was watermelon pink, emerald and white.

Cool and cap-sleeved for comfort, princess lined for best figure effects, No. 2635 has many possibilities for that dress we seem always to need. Made up in a pretty flower print it has that delicate summery look and still is easy to construct and to keep looking well.

The ensemble idea permits a great variety in mixing and matching one's own outfit. Ensemble No. 2790 consists of dress, jacket (not shown) and skirt. The blouse and skirt may match or the blouse may be of striped material with the plain skirt matching the jacket—in which case it makes a highly useful travelling outfit or one to wear shopping. There is no reason why the skirt and blouse could not be sewed together if preferred that way. Pique, seersucker, sharkskin, linen and spun rayon chambray are all tubbable and tailorable enough to look well in this outfit.

No summer wardrobe is complete without that easy-to-don and easy-to-doff kimona-sleeved frock, ready at a moment's notice. No. 2642, interpreted in a flowered print with crisp white ruffles or with some of the pretty fancy edgings, answers that requirement "to a T."

Graduation time is almost here and No. 3272 with its long torso, its pretty neckline and swinging skirt is smart enough for the smartest young graduate. Trim it at neck and sleeves with lace and that, together with its softly shirred front, adds the necessary touch of femininity.

A real play outfit is a necessity for all active sportswomen. No. 2830 in-

(Continued on opposite page)

Aunt Janet's Favorite Recipe

In the spring our thoughts naturally turn to rhubarb with its refreshing tartness; rhubarb pie especially appeals:

RHUBARB PIE

- | | |
|-----------------------|-----------------------------------|
| 1 recipe plain pastry | 2 eggs well beaten |
| 1 cup sugar | 3 cups rhubarb cut in 1/2" pieces |
| 2 tablespoons flour | 2 tablespoons butter |
| 1/2 teaspoon salt | |

Line 9" pie plate with pastry. Combine remaining ingredients except butter and pour into pastry shell. Dot over with butter, cover with upper crust and bake in hot oven (425° F.) for 10 min. Reduce to moderate heat (325° F.) and bake 25 to 30 min. longer.

A bit of lemon improves the flavor of rhubarb and for special occasions you may like to serve on your pie

Hot Lemon Sauce

- | | |
|----------------------|--------------------------|
| 2 tablespoons butter | 1 tablespoon lemon juice |
| 1/2 cup sugar | Grated rind of 1 lemon |
| 2 tablespoons flour | 1 1/2 cups boiling water |
| 1/2 teaspoon salt | 1 egg beaten |

Cream butter and sugar together; add flour, salt, lemon juice and rind. Add boiling water gradually, stir until mixture thickens. Add to beaten egg and cook 2 min. longer but do not boil.

One-Act Play Contest to Run to July 1st

American Agriculturist's one-act play contest, which started last October and was scheduled to close June 1, has been extended to July 1 in order to give contestants a little more time to get their plays in.

The aim of this contest is to stimulate interest in writing rural life plays which can be produced by community dramatic groups. Anyone who has an interesting idea for a play about rural life is invited to take part. Plays should consist of one act, requiring about 30 minutes to play; stage setting should be simple enough for an amateur group to set up. As to kind of play, it may be a tragedy or comedy, or a jolly or ridiculous farce, but it should have a rural background, historical or modern.

Even if you have never written a play before, see what you can do. Perhaps you know some interesting old tale of something that happened in your neighborhood or State that would be the basis of a good rural life play. Try your hand at writing about it. You may win a cash prize, or an honorable mention, or possibly get your play produced by the Cornell University Theatre, which is cooperating in this contest. Cash prizes are: 1st, \$15.00; 2nd, \$10.00; 3rd, \$5.00.

Plays should be submitted on plain paper, about 8 1/2 x 11; they may be typewritten or handwritten, but must be legible. Mail flat, in large envelope, to Play Contest Editor, American Agriculturist, Box 367, Ithaca, N. Y., not later than July 1, 1940.

Local groups interested in producing good one-act, rural life plays will be glad to know that Cornell University Theatre has a collection of such plays, including some of the winners in our last year's play contest. The person to write to about them is Mr. Robert Gard, c/o Cornell University Theatre,

Ithaca, N. Y. Printed copies of "Fish-in' Weather" by Samuel S. Hale, of Oxford, N. Y. (last year's second prize winner) are now available at 25c each, and can be obtained from Mr. Hale.

Warm Weather Clothes

(Continued from opposite page)

cludes in-or-out blouse, roomy pleated shorts and a skirt that buttons on in a jiffy. Make one or more of them in a Javanese print, gingham, pique, or in seersucker and you will live in it the whole summer long. They are just as useful for home gardeners as for tennis players or beach lovers.

Another dress that is right for any time of day is button-front dress No. 2745. Make it up in one of the new pastel or else very brilliant colors with white collar, cuffs, buttons and belt. Its semi-tailoredness calls for one of the firmer weaves.

The little girl lives up to her older sister in the matter of big pockets. No. 3251 has not only big pockets, but cute cap sleeves, nifty round collar and is so simple to make that with a little help she can even make it herself. Keep your eyes open for a pretty material with figures in proportion to your child's size.

The smallest member of the family if able to navigate at all will want a sunsuit. No. 3252 with its perky little ruffle trim and sunbonnet and bolero (not shown) included, is too sweet to resist. Get one of the many prints designed for tots and enjoy making this little outfit.

PATTERN SIZES

- No. 2635 — sizes 12 to 20. Size 16 requires 3 yards 39-inch material, 3/4 yards braid.
- No. 2790 — sizes 12 to 44. Size 36 requires 1 3/4 yards of 39-inch material for blouse; 1 1/2 yards for skirt.
- No. 2642 — sizes 16 to 50. Size 36 requires 3 3/4 yards of 39-inch material.
- No. 3272 — sizes 12 to 42. Size 36 requires 3 1/2 yards of 39-inch material, 1 1/2 yards lace edging.
- No. 2830 — sizes 12 to 20. Size 16 requires 2 1/4 yards of 39-inch material for blouse; 1 1/2 yards for shorts; 2 3/4 yards for skirt.
- No. 2745 — sizes 14 to 46. Size 36 requires 3 3/4 yards of 39-inch material, 3/4 yard 39-inch contrasting for dress.
- No. 3251 — sizes 6 to 14. Size 8 requires 1 1/2 yards of 39-inch material, 5/8 yard 35-inch contrasting.
- No. 3252 — sizes 1, 2, 3 and 4. Size 2 requires 1 3/4 yards of 35-inch material for sunsuit and bonnet.

TO ORDER: Write name, address and pattern size and number clearly, and enclose 15c in stamps. Address Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Summer catalog, containing over 100 attractive patterns for all ages and occasions.

THE AWFUL PRICE YOU PAY FOR BEING NERVOUS

Read These Important Facts!

Quivering nerves can make you old, haggard, cranky—can make your life a nightmare of jealousy, self pity and "the blues." Often such nervousness is due to female functional disorders. So take famous Lydia E. Pinkham's Vegetable Compound to help calm unstrung nerves and lessen functional "irregularities." For over 60 years relieving Pinkham's Compound has helped tens of thousands of grandmothers, mothers and daughters "in time of need." Pinkham's Compound positively contains no opiates or habit forming ingredients—it is made from nature's own wholesome roots and herbs each with its own special work to perform. One of the most effective "woman's" tonics made! In liquid or handy to carry tablet form (similar formula). Try it!

Ruth B. Whitcomb, Concord, New Hampshire.

Church Supper

By Romeyn Berry

CHURCH SUPPERS aren't what they used to be. Not that church suppers aren't still very nice indeed and well worth what they cost, but nowadays too much has to be bought at the store and the competition is now between the different Ladies Aid Societies to see who can turn over the biggest balance, rather than among the champion cooks of the various communions to determine whose raised biscuits are reached for fastest by hungry men.

Forty years ago everything served at a church supper was donated except the coffee, the sugar and the ice cream. And commonly cash to buy those items was contributed by some summer boarder who'd been coming up so many years that she regarded herself as one of the congregation. When you could put one on that way without paying out a nickel, a church supper was a profitable venture even at 30 cents a head (40 with ice cream).

Nowadays, too often the hamburger, the coffee, the butter and the Parker House rolls have to be bought at the store and cooked in the kitchen back of the church parlors. Nothing much is brought in ready to put on the table except pie, cake, pickles and preserves. That must cost quite a little and I doubt if the Ladies Aid clears as much that way charging 50 cents as they used to at 30 cents (40 with ice cream) when everything was donated and the stove back of the church parlors was used only to heat up the chicken gravy and to make the coffee.

Moreover, the meat, whether it be roast fresh pork, meat loaf or pot roast, is now brought to you on a plate—no reaching. It has to be done that way, I suppose, because now that meat costs money, Ed (Mr. Briggs' hired man) would set the Ladies Aid back \$2 in pot roast alone if you put it on the table and let him reach.

There were four church suppers every summer in our valley—Baptist, Methodist, Presbyterian and Congregational—and the summer boarders attended all of them without the slightest bigotry. Indeed nobody could detect any difference among the four except that the Congregationalists made their coffee the weakest and the Presbyterians the strongest. Everything was on the table when you sat down except the chicken gravy and the raised biscuits (which were rushed in piping hot the instant the minister had asked the blessing), the coffee which was poured over your shoulder when you held your cup up, and the ice cream which came later and was extra. Everything moved like clock work, except at almost every church supper some hungry lunkhead would start reaching for the escalloped potatoes before the minister had asked the blessing, and his wife would turn red as a beet and wouldn't speak to him the rest of the evening. She thought people would suspect from the incident that they didn't ask a blessing before every meal at their house and she thought right.

There were so many things on the table there was hardly room for your plate and each summer some unhappy little boy would press down on the edge and flip his entire supper over on to his Sunday pants.

Let's see! There'd be platters of cold boiled ham and sliced tongue; butter in one-pound, circular pats, fricasseed chicken in granite-ware pans, baked

pork and beans, corn puddings, escalloped potatoes, dill pickles, sweet tomato pickles, pickled peaches and watermelon pickles; there'd be angel cake, orange cake, coconut cake; custard, caramel, banana and mince pie.

The ice cream (which was extra) was either chocolate or vanilla. It was dipped out with a big kitchen spoon and you could gauge a man's popularity by the size of the dip he got. The minister, the supervisor and the Sunday School superintendent got the biggest.

You couldn't have a church supper like that any more. Food has a money value nowadays. It didn't then. What was a couple of roosters for a fricassee, or a cake rule that called for six eggs and two cups of butter? Only the sugar had to be bought. Escalloped potatoes bore no relation to cash. If the church needed a new roof, everybody knew the congregation would have to pay for it somehow and the most painless way to pay for it was with sliced tongue, marble cake, custard pie and pickled peaches.

The summer boarder was an element in the situation, too. If you managed shrewdly, the summer boarders could be counted on to pay for a good half of the new roof, and on the night of the church supper you didn't have to get an evening meal at home because everybody went. Lots of times, too, a man from the city would pay a dollar bill for a 30 cent supper and refuse to take any change—just to help the good cause, and perhaps show off a little, too. Summer boarders like that don't come up our way any more; and in those sections where they still have them, boarders now prefer driving 75 miles for a shore dinner to walking down to the corners for chicken, orange cake and raised biscuits.

Sometimes now I go to one of these

suppers at the new Central School that the girls in Home Economics put on to pay for new purple suits for the boys' basketball team. These are very nice but they are not quite like the kind of supper we've been talking about. When you have to pay for eight purple basketball suits with one supper, it's necessary to slice the meat loaf pretty thin and naturally you can't put much butter and cream in the mashed potatoes. Every time I look at one of those basketball platefuls, containing all the vitamins the teacher says my system needs—but not much else—I get to remembering again the groaning tables at the old church suppers where a man could reach out (once the blessing had been said) and fix himself up for the evening the way he wanted to.

I don't know how it was in your church, but with us the Ladies Aid Society was made up of good cooks exclusively, with not a dietitian in the lot. At our church suppers you could count on the best cooking and the best food the valley was capable of producing, without one single vitamin in any of it. I may be old-fashioned, but I don't mind telling you I still prefer the old way. You can have vitamins in your mashed potatoes if you want to, but I'd rather have a little butter and cream in mine—the way the Ladies Aid Society did it for the old 30 cent church suppers in our valley.

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Things That Are

We love Thee, Lord,
And Heaven is beautiful—
But so is earth, especially in Spring.

We think of loved ones gone,
And yearn to see them all again;
But then the loved ones here
Are dear to us. It would be hard to say
Goodby to them, and leave behind
So much of beauty—all the things
We know, and love, and touch—
For other joys, not comprehending
much

Of what You've planned for us.

We know it will be better, fairer far
Than things we've known—
But Lord, we love the things that are!

—Mrs. Elizabeth Wells Webster,
Whiting, Vermont.

Personal Problems

What About Giving Flowers?

Dear Lucile: A young men's organization to which I belong is giving a dancing party in a couple of weeks.

It is the custom for most of the fellows to send corsages to the girls they take to the dance. Here's what I want to know: My older sister makes lovely artificial flowers. She has made many corsages which have sold for nice sums, and can make up anything, such as orchids, rose buds, sweet peas, etc. You just can't tell the difference. And I think if I had her make a corsage for my girl, she'd have it as good as new to wear lots of times besides the dance.

Would it be proper to give her these artificial flowers?—Wondering.

I'm afraid the artificial flowers won't

do, pretty as they may be. For one thing, nothing thrills a girl like lifting a corsage of fresh, fragrant flowers from the wrappings of a florist's box. Too, corsages are limited to evening wear and I doubt if the young lady would wear an artificial one very much on other occasions on her street or school clothes.

Why not give her real flowers for the party, then ask her what kind of flower and what color she likes, and have your sister make up something for her later on, for a birthday or some special holiday?

* * *

Re-Value Yourself

Dear Lucile: As I am in between the age of 19 and 25 I would like to have dates, but it seems that the girls just do not care about me.

I, myself, don't think I am so queer looking that my appearance could be the reason. I have asked several for dates but they just say they are sorry and have other plans (which I don't believe).

Could it be something to do with my ways toward them, or is it just one of those things that happens? At times they have a pleasant greeting and smile for me and the next time they just give a glance and walk on as if they didn't see a person (but they do).—Disgusted.

I venture to say that a lot of your trouble is caused by an inferiority complex—an exaggerated feeling of the world being against you, when as a matter of fact, it is not, except in your own mind.

It is well to remember that other people put about the same valuation on us that we place on ourselves. If you feel timid and shrinking and slighted by your friends, both male and female, chances are good that they are going to consider you rather a nonentity, and pay little attention to you. On the other hand, if you lay aside your periods of self-pity; decide once and for all that you are on an equal footing with them—and conduct yourself accordingly, I believe you will notice a great change. Give it a trial, won't you?

* * *

(Please Note: Will "A Troubled Mother" and "Uncertain" please write to Lucile again and give her their real names and addresses, so that she can answer their letters? Unsigned letters will not be answered in these columns. Names of all persons writing to Lucile are kept entirely confidential, so do not be afraid to sign your name.)

The Song of the Lazy Farmer

MY NEIGHOR'S sharpenin'

his plow, he says it seems to him as how the time you spend to put an edge on tools for trimmin' up the hedge or turnin' soil is time well spent. A feller gits all gnarled and bent a-workin' with the tools that's dull, so ev'ry time he gits a lull, that feller gits his grindstone out and turns away; he spends about the most of ev'ry rainy day, when I am sleepin' on the hay, a-grindin' all his tools so fine that I am quite ashamed of mine. He says sharp tools save lots on power, and do work better, ev'ry hour that he spends with that stone of his, saves two or three of toil, gee whiz, when he gits goin' in the field, and so he gits a bumper yield.

Along with tools, I tell him it's worth while to sharpen up your wits, in fact, between the two I'd say, sharp wits will make the old farm pay as much as tools, and mebbe more, a feller can't have too

much store of brains to make the farm succeed, and that is why I feel the need of sleepin' on a rainy day to rest my brain; it doesn't pay to wear it out till it's so dull that ev'ryone who comes can gull you out of half of what you've got. I'll keep mine sharp, as like as not, by restin' it when'er I can, and hope perhaps my hired man will grind the tools; more likely he is sleepin' just the same as me, but when the weather lets us start, I reckon that we'll both be smart, with sharp wits we will find some way to cultivate and cut the hay.

The Co-op that Farm Women Built

(Continued from Page 1)

from the beginning by the county home demonstration agent and other specialists of the extension service, who visit the market from time to time to check quality of the products.

Nearly 100 farm women now belong to the cooperative, and many of them have developed specialties—various kinds of bread and buns; salt-rising bread; ice-box rolls; cookies, pies, cakes, candies, applesauce, peach and apple butter; hominy and baked beans; pork sausage seasoned in a dozen different ways; all the usual cuts of beef, veal, lamb, and pork; home-cured hams and bacon; chickens, turkeys, ducks, and guineas dressed for frying, stewing, baking, or roasting, or cooked ready to serve; sweet and salted butter; coffee and whipping cream; sweet milk, buttermilk, and cottage cheese. One seller has specialized in flowers with marked success. Flowers, fruits and vegetables in season appear on nearly every counter.

The trim looking market building occupied by the Cooperative was erected in 1932. In 1934, the land on which it stands was put up for sale by its owner. The price, \$50,000. At first the Cooperative decided that it would have to move to another location, but finally found that it would cost just as much to build elsewhere, besides running the risk of losing some of their trade. All of the needed money except \$5,000 (which the association had saved) was borrowed from the Baltimore Bank for Cooperatives and a local bank.

There is an amusing story of the borrowing. At first the officials of the bank were cold to the proposition. They listened respectfully to the committee of farm women and said they would "take the application under advisement." They agreed to call at the market the following Saturday, but with no expectation of finding a business which would warrant such a loan.

When the bank representative arrived at the market that Saturday morning, he got the shock of his life. The place was teeming with life. Cars were packed in the parking areas on three sides of the little frame building. Inside, the place was jammed with eager buyers. Flowers decorated every one of the 80 glass-covered counters. Behind each stood a farm woman seller, dressed in a fresh white smock, and busily engaged with customers.

After taking one look at the brisk scene, the bank representative hurried over to the counter of the farm woman who was President of the cooperative, and assured her that his bank would be only too glad to make the necessary loan. So instead of rent, the cooperative now pays interest, insurance and taxes, and week by week is reducing the original loan and increasing the value of the cooperative's holdings.

None of the farm women members of this Cooperative has made a fortune, and all of them have worked hard, not only on the two market days but also preparing their products at home on

the other days of the week. But they have much to show for their efforts. The extra money they have made has come in very handy. Some have used it to modernize and refurnish their homes, or even to build a new one. Many were able to save their homes and farms from foreclosure. Sons and daughters have been sent to college or business schools. "The market," says Mrs. Julian B. Waters, President of the Cooperative, "means a living for almost every person who has a stand in it, and there is usually a large waiting list of those desiring to join."

Besides the money angle, these farm women have received other benefits—learned to be good business women and good cooperators, added to their experience, improved their judgment, broadened their interests, made new friends, and discovered that an attractive appearance and a pleasant manner are real business assets.

Another interesting thing about this cooperative market is the way it has affected the farming practices on the home farms of the women. In some

OLD FARMER

By Eleanor Alletta Chaffee.

He loved the gnarled and twisted tree
Planted the year that he was born:
Both were bent by storms and years,
Both were old and patched and torn.

But when along those ancient boughs
The waxen petals break like spray,
His old hands tremble on the stile;
He sighs, and turns his face away. . . .

instances the entire farm practices have been changed and much of the production is now designed for the sales outlet offered by the market. The men folks, however, are not allowed to sell on the market or even to assist after the displays are arranged on the stands. A number of the women are assisted by their daughters on busy days.

Can other groups of farm women build up a similar flourishing market for their products? Experience of the Montgomery Farm Women's Cooperative Market would seem to indicate that among essentials to success are: Nearness to a large city (the Montgomery cooperative draws its trade from Washington's half a million people); starting on a small scale; knowledge of what products appeal to buyers in a particular locality; high quality goods, attractively displayed; regular inspection of products by experts; standard prices; good parking space for buyers; advertising; and a system of individual responsibility of each member for her own products—not only for their preparation, but also for their transportation to market, arrangement of display, sales to customers, and disposal of surplus at end of each market day.

Careful choosing of members is also important. The Montgomery association accepts new ones only on written application and after a rigid inspection of their farm and kitchen.

Letters from women in other States, asking for information on how to start such a market, are frequently received by the Montgomery Farm Women's Market. The fame of these farm women has even traveled to foreign lands, for in 1936 a feature of the Washington meeting of the Associated Country Women of the World was a visit to this market, and delegates to the convention from other countries showed great interest in getting ideas for similar markets in their own lands.

"A QUICK CALL TO THE VETERINARIAN IS ALL THAT SAVED THE OLD GIRL"

LIVESTOCK and farm buildings and even human lives are saved because some one got help by telephone in the nick of time. Work goes on in the fields because the telephone brought implement repairs or new parts quickly. Every day, somewhere, the telephone is of special service on the farm.

STATE TOWER BLDG. SYRACUSE, N. Y.

By L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

SO FAR AS detailed long-range planning is concerned, the National Planning Committee of the apple industry at its Rochester meeting did little more than clarify sentiment on a few ideas. Twenty-two states were represented when the roll was called, following closing of the annual meeting of the National Apple Institute.

The institute embraces in its membership various state and regional organizations concerned with promotion of apples. The New York and New England Apple Institute is one of the member groups, and John Chandler of Sterling Junction, Mass., its president, did the welcoming honors. Reports from various sections of the country indicate that considerable effort is being made by the promotional groups and by the trade organizations to stimulate consumption of apples.

Paul Stark of Louisiana, Mo., was elected president of the national institute, succeeding Kirk L. Keller of Creve Couer, Mo., named chairman of the board of directors. John Lyman of Middlefield, Conn., was reelected vice-president. B. S. Pickett of Ames, Iowa, who has been board chairman, was elected secretary, succeeding Dr. H. E. Barnard of Indianapolis, who continues as research director. C. E. Dutton of Milford Center, Ohio, was reelected treasurer and Truman Nold of Indianapolis was retained as manager by the directors.

New Markets Urged

That there remains new markets to explore was suggested by Earl R. French, national promotion manager of the Atlantic Commission Company. He said that during the past year the southern division of his company had increased apple sales by 70 to 75 per cent. Cy B. Denman, agricultural counsel for the National Association of Food Chains, echoed this when he said a sales experiment by one chain has boosted apple sales in Louisiana by 51 per cent.

Edward M. Synan of Boston, director of the National Association of Grocers, likewise was optimistic about apple sales, but urged upon the growers that they pack uniformly as to grade and size. He said a New England survey disclosed that the independent grocers were handling about 35 per cent of the apples. "Increased sales in New England definitely have not been built up by orchard-run fruit," he said. "The housewife can better plan to meet her needs with uniformity of size and quality." He said that four or five pounds had been found to be the most suitable unit of sale.

Action by Planners

The planning committee had been set up by the various states as a step toward charting the future of the industry. It was to concern itself largely with the economic issues. The only point on which there appeared to be unanimity of thought was that marginal trees and orchards would be removed. In general, the idea was that they should be removed without expense or at a minimum of expense to the grower.

Removal of marginal trees was voted unanimously, but there was difference of opinion as to whether WPA,

relief labor, AAA, or some other agency should provide the means. Finally it simmered down to the belief that the best means might be to bring tree-removal under the agricultural conservation program. It was explained that just about so much money was provided for fruit growers. At present growers participating in the program may obtain \$2 per acre for applying fertilizer and other soil-improving practices. One suggestion was that growers give us this money and that it be pooled for tree-removal. Some thought this would not meet with favor, so it was suggested that part of the money be used.

A committee was named to draft a program to present to the agricultural conservation officials. It is expected that it will be submitted to state agricultural conservation committees and to the program meetings in Washington. Carl Wooster of Union Hill, N. Y., is a member of this committee.

Would Mark Grades

A resolution was introduced urging that all apples offered for sale as fresh fruit be marked as to grade, and that all apples not meeting grade requirements be marked culls. On the first vote the count was 11 to 11. After lengthy discussion the matter again was submitted and carried by a vote of 18 to three. A few of the delegates hesitated to be deprived of the privilege of selling their apples as fresh fruit unmarked, good, bad or indifferent as to quality. It was pointed out there are at least six grades in which fresh fruit may be marked; that the sale of good apples was injured by dumping so much junk in the stores, and that the marking would be a step in the direction giving the trade and consumer uniform quality.

It was explained that under the federal marketing act, Washington, Oregon and Idaho are the only states which may set up a marketing agreement on apples, similar to the milk marketing orders in New York. It was proposed that the marketing act be amended to provide that if and when any other area desired to petition for a marketing agreement it could do so. The vote was 11 in favor and 10 opposed.

Some of the opponents explained their growers were not familiar with marketing agreements and that they desired time to consider. It was explained that the proposed change would

be permissive only. Carl Wooster voted in favor of the grade-marking resolution, saying that he never packed anything less than Utility grade. He also voted in favor of the proposed change in the marketing act, saying that farmers in New York had found they could use the act to their advantage.

Keller Named Chairman

Kirk Keller was named chairman of an executive committee of the planning committee. Presumably it will try to shape some planks in a program to be submitted to the larger committee. There was lengthy discussion as to how the committee should function and be financed. Immediate problems involved centered around expenses of delegates and distribution of the minutes of the meeting. Some delegates thought the state horticultural societies would pay and it was decided to leave it that way.

Next meeting of the committee was left to the call of the chairman. The Apple Institute left its meeting place to its executive committee, after hearing an invitation to meet in Washington, D. C.

* * *

Interest in New Storage

There is considerable interest among growers in the experiments at Cornell with modified atmosphere storage of apples. It is indicated that a considerable number will attend the opening of storage chambers where apples have been held since last fall. It is expected that this storage method may considerably lengthen the season for high quality apples. Studies have been made allowing the apples to mature fully on the trees and then keeping them in storage much longer than the usual time. If the practical and cost aspects of the plan can be worked out, this may prove to be a great boon.

There still is a good market for good apples late in the season. Yesterday I visited with a Wayne County grower who is rolling a truckload of 400 bushels of Northern Spies to New York each week. He showed me his invoices. He is getting \$2 per bushel for Fancy and \$1.75 for Number 1, in which most of them are graded. He pays 15 cents for transportation, so any grower can figure how he is cleaning up. I asked him how he did it, especially as some of his neighbors sold their Spys for less than a dollar a bushel. "I made a good deal with a good outlet for good apples and I had faith in the market," he said.

The buying office of one of the large chains said it has advertised and promoted McIntosh so much that now it finds it cannot obtain fruit of good quality to meet the demand.

* * *

Season Late

Generally in Western New York there has been complaint that the season is late. In many orchards the usual winter pruning was delayed because of deep snow. One good thing is that

most of the snow and heavy rains ran into the ground this spring, at least partially offsetting the moisture deficiency caused by a couple of dry years.

* * *

"The Greatest Problem"

"The greatest problem facing farmers today is nothing more or less than the national debt," Samuel R. Guard, former educational director of the American Farm Bureau Federation, told the annual City and Country dinner at Greece Baptist Church. These dinners, planned by the Rev. Fred E. Dean, former chaplain of the State Grange, have become an institution and attract notables from all parts of the state and beyond.

Guard likened the national debt to a farm mortgage. "Suppose you have a 415-acre farm. In 1932 you had a mortgage of \$18,000. By 1939 you had increased the mortgage to \$49,000. Now you find you can't make enough money to pay the interest. The crushing debt holds everything back. The thing to do is reduce the mortgage and live within your income."

Larry F. Livingston of Wilmington, Del., manager of the extension department of the DuPont Company, said research promises a bright future for agriculture because it is finding new crops and new uses for crops. He said he thought the consumptive capacity of food crops was limited, but that industrial uses were just getting started. To illustrate his point he displayed several score articles made from farm crops and ranging from paint to women's fine hosiery.

Blossom Festival May 18

Admiral Reginald R. Belknap will crown the "queen of queens" at the 10th annual Western New York Apple Blossom Festival in Batavia, May 18. Previous to that time the various counties will have selected their county queens and one of these will be chosen to preside over the festival ceremonies.

Features of the festival will be the "Parade of Youth," with two-score bands and nearly as many floats, and the coronation ceremonies on the grounds of the State School for the Blind. All events are free to the public.

Grange Cookie Contest News

Chenango County Grange First to Hold Contest

Preston Grange of Chenango County got off to a flying start with its sugar cookie contest and was first to send in its report to this office. First prize winner was Miss Ruth Hartland, of Star Route, Norwich, N. Y. Close on the heels of Preston Grange's report came four others. Here is the complete list of winners to date:

COUNTY	GRANGE	WINNER
Allegany	Whitesville	Mrs. Willis Leach
Chenango	Preston	Ruth Hartland
Columbia	Claverack	Mrs. Emma V. Bryant
Cortland	Taylor Center	Mrs. Ada Smith
Orange	Balmville	Mrs. Edward Challenger

Hundreds of these cookie contests will be held during the next few months by Subordinate Granges throughout the State in connection with the state-wide sugar cookie competition being sponsored jointly by New York State Grange and *American Agriculturist*. Winners will match each other later in county contests, and the 53 county winners will then compete in a final state contest to be held next December during State Grange annual meeting.

Valuable cash and merchandise prizes will be awarded by this publication and our advertisers to State winners, as well as merchandise prizes to all Pomona winners. List of prizes will be announced in these columns next month.

Some New York apple growers who attended the National Apple Institute at Rochester, New York, recently. From left to right: Earl Merrill of Monroe County; M. E. Buckman of Wayne County; Carl Wooster of Wayne County; E. Stuart Hubbard of Dutchess County; James Case of Wayne County; Frank Beneway of Wayne County.

"I've owned a
CLETRAC
for more than
twenty years."

Says E. H. Beckwith, Ludlowville, N. Y.

"The best and most dependable farm tool I own. I'll always have a Cletrac as long as I farm."

We Can Deliver a Modern Crawler Tractor at Your Farm for

\$965.

CLETRAC MODEL H-G

42-in. Tread, 6-in. Track \$965.00
68-in. Tread, 6-in. Track \$985.00
42-in. Tread, 10-in. Track \$995.00

Here is a tractor that asks no favors. You can plow under adverse conditions. You can plant, cultivate and harvest on time. You can run a mill or feed grinder; you can saw wood; you can pull stumps; you can dig ditches and do other miscellaneous work — whenever you want.

TRY the "Cletrac" or the "General" on your own farm—under your own conditions.

Cletrac Crawlers
for better work at lower cost

Kernels, Screenings and Chaff

By H. E. BABCOCK

A FEW DAYS ago a conscientious and capable public servant said to me that he was terribly concerned about the youth of America because there were no more new frontiers to conquer. My reactions to this gentleman's observation then and now are very definite and very emphatic.

A Bad Slant

In the first place, I am of the opinion that it is very bad for the young people of our country to hear such observations from the lips of respected adults. Just hearing that they have no opportunities affords a refuge for inaction and resignation on the part of thousands of boys and girls who would never even think they were underprivileged if they did not hear it from others presumably older and wiser. Of course, there are a few who are immediately challenged by such a statement, but they are in the minority and are no problem anyway. *They will take care of themselves.*

Aside from the psychological effect of the defeatist attitude of the gentleman I am quoting, and others who hold similar opinions on the great masses of our youth, *there is the additional fact that they are not telling young people the truth!*

Plenty of New Frontiers

As a matter of fact, because of the very complexity of our society and the operations within it, the youth of today has more new frontiers to conquer than any generation which has yet lived in this country. *It is not opportunities they lack but the spirit to conquer and the will to work.* Nor is the will to work being developed in them.

Without attempting to list any new and far away frontiers, I would like to point out to the youth of certain families who I know are on relief that there still remains the frontier of the woodpile.

I have seen, and I am sure that many who read this column have seen, husky boys from fourteen to twenty living all winter on relief or merely existing on a pittance while they bemoan their lack of opportunities. *And not one of them has even had the guts to take an ax and a saw and go into a neighbor's woodlot and put up his family's fuel supply.*

Two-Job Men

On the other hand, I see all around me boys and men who during the last few years have steadily moved ahead. Most of these fellows are *two-job men*. They assist in "spreading" the work by holding one job on which the hours are set by law and union regulations — hours which don't begin to take their full toll of a normal man's energies and ambitions—and by having a private job on the side which they handle after they have gotten through with their other work.

The very existence of short work

hours and good union pay on so many jobs today furnishes the really ambitious youth with a new frontier in itself. The guy who really wants to work can for the first time in history handle two seven-and-one-half-hour a day jobs and still have plenty of time to sleep. *These young fellows are not complaining about a lack of new frontiers nor are they paying much attention to those good souls who are worrying about the youth of America.*

Down Mexico Way

From H. E. BABCOCK, JR.

April 22, 1940.

"Cotton planting started this morning, and by night we had in about fifteen acres. Altogether we have had twelve horses in the field all day. The two planters take a team apiece, and we had two four-horse teams on the two wood levelers. I said yesterday that we had about a day's preparation ahead of the planters, but it looked tonight as if we were hardly half a day ahead. We have everything planned so that we will be able to maintain this position even with unlooked for breakdowns.

"I have planned for some time to put down the attitude of the farmers in this section towards the AAA and cotton regulation. Although most of them opposed the idea from the start they have gradually seen, so they think, that it has done them a lot of good in the past few years.

"Those not in farming, and therefore not having been acclimated to the benefits directly, view the whole New Deal program with misgivings and distrust. They are all such devout Democrats, however, that they feel if Roosevelt runs for a third term, they'll just have to get out of town so they don't have to vote. One man here pledged his

dying mother that he would never vote anything but a straight Democratic ticket.

"The wind has been blowing for the last two days. This can be quite disastrous since it will dry the ground out below the level of the cotton seed. Opinions vary on how long these windy days will keep up, but we can only hope for the best.

"We cut out a pretty good looking car of lambs this morning to ship Thursday. The market was flooded yesterday, and doesn't act too strongly. In a short while, all these lambs will be classed as yearlings, so I guess everybody is unloading. We were offered \$6.25 for our hogs this morning, but the market looks strong enough to wait a week or so. They are just getting alfalfa and a half-and-half oats and maize mixture in the self-feeders.

"The Johnson grass is getting so rank on the big No. 1 field that we are going to turn the ewes in there tomorrow. I am going to send you a sample of Johnson roots. I wish you would put them in some warm moist soil and see if they will grow. I believe that they will grow even after the trip. Since the roots are only underground about three inches, they are killed where the ground freezes."

It Works

After using two issues of the paper to make inquiries, I finally received a flood of suggestions as to how to take the fight out of a bossy heifer without dehorning her.

Walker W. Ketchum of Locke, New York, writes:

"When a heifer wants to boss I saw off the tip of the horn about one-half to one inch, trying to just barely draw blood; then round the end with a common file. This makes the horn sensitive and in a few weeks it will not look as though it had been touched."

We have tried this and it takes the bossiness out of a mean heifer.

Another idea came from Lloyd V. Rowley of Albany, New York, who suggested tying a piece of heavy belting to the mean heifer's horns in such a way that it partially shuts off her vision and wholly cuts it off when she drops her head in advance of hooking another heifer. We have tried this and it also works. Since it is so very simple I rather imagine that Mr. Rowley's method is the one that we will follow

in the future, except in perhaps the case of a heifer which should have her horns trimmed to improve her appearance.

Old-Fashioned

For years we have been hearing about an old-fashioned winter. Well, apparently we have just had one. According to Congressman James W. Wadsworth of western New York the way to cope with an old-fashioned winter is to use old-fashioned methods. Writing to his friend T. E. Milliman on March 28 Congressman Wadsworth tells how he cleared a road in New York's Genesee Valley. Said Mr. Wadsworth to Mr. Milliman:

"You are accurate in your description of the appearance of the Genesee Valley at this time. I have been up there several times this winter and my last visit was only two days ago. The snow was still piled high and the side roads pretty well blocked with drifts. It may interest you to know that in working a road to one of my farms the motor driven snowplows and tractors all failed. Finally we got a bunch of eighty beef steers which were on feed at the farm and by driving them back and forth a couple of times over the road the job was done. We have become too dependent upon gadgets in this modern civilization. The four-footed beast is still the farmer's best friend."

Kill the Breeders

Sometime I would like to see a campaign launched by some big, powerful agency, like the state or federal Department of Agriculture, to kill flies.

Nothing seems to me more futile than spraying cows to keep flies off them after the flies have been allowed to hatch by the millions. What should be done, in my opinion, is to kill off the breeders in the early spring and to eliminate so far as possible the areas around farm buildings in which flies breed.

What is needed is some machine which will completely fog up barns in May and June with some fly killer which will penetrate into the nooks and crannies and kill off the breeders, and some preparation which can be sprinkled on manure piles and other refuse in which flies breed. A concerted drive along these lines for a year or two might appreciably cut down our fly population.

Once or twice I have written on this page about the pleasant experience I have each evening at Sunnyside when I go down and make a tour of the barns just before bedtime. Repeatedly when I have looked in on our pen of fifty Hereford heifers along about ten o'clock at night, they have all been lying down contentedly chewing their cuds. Whenever I have found them thus comfortably bedded down for the evening I have had a longing to share the picture I see with the readers of Kernels, Screenings and Chaff.

Twice we tried to get flashlight pictures. One night a heifer jumped right up in front of the camera — she must have gotten up without our seeing her before we set off the

flash — and blocked out all the rest which were lying down. In our second trial we were also unsuccessful in getting a good picture, but we did pick up clearly the two heifers shown above. Add forty-eight to these two, scattered through a long basement, and you have the picture which has so often thrilled me this winter.

From watching these heifers and our other loose livestock I AM CONVINCED THAT DRY BEDDING AND A CONSTANT SUPPLY OF WATER — though I put the bedding ahead of the water, particularly where animals are free to drink from natural springs in the daytime — are as essential as feed in wintering young cattle well.

Protective SERVICE BUREAU

MEMBER
AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Conducted by H. L. COSLINE

At Your Service

"I have been a subscriber to *American Agriculturist* for many years, and this is the first time I have called on you for help. I hope I am not asking too much."

We are more than glad to send you by mail the information you want. Our only complaint is that you have not called on us earlier and oftener. Having advised in these columns so often to view with suspicion the man who "guarantees results," we naturally cannot do that. Many problems come to the Service Bureau desk which are so complicated and involved that advice is difficult. Nevertheless, we always do the best we can. What is more, we are glad to do it without a cent of cost to any subscriber. Naturally the service is for subscribers, and the Service Bureau cannot attempt to assist the general public.

Sometimes when letters concern claims for produce sold, we find on investigation that the firm is bankrupt or that the proprietor has skipped town. That is unfortunate, yet in many cases our prompt action does get returns which subscribers tell us they could not have secured without our aid.

Anyway, no problem is too small to warrant our attention. We promise you our best efforts to aid you, and whatever the results may be there will be no bill. Our pay consists of a sense of a job well done and a thank you from our readers.

This is your department. The more you use it, the better we like it.

* * *

On Trial

On Wednesday, April 17th, at Syracuse, New York, was started the trial of 17 officers and salesmen of the Traffic Inspectors Training Corporation of Syracuse on charges of using the mail to defraud. About 50 persons, including more than a score of students of the school, have given testimony and Robert Leamy, Assistant United States Attorney, indicated that he is planning to have about 100 other witnesses, many of whom are from the southern states. When the trial is concluded, we plan to report the outcome.

* * *

One Way to "Get In"

One day a young man and a girl called here. The man said:

"Did you ever think you would like to sell this farm? I have an old couple in Lewiston (my aunt). We are the last of our clan. You can take old peo-

Farm Service Bulletins For You

IN ORDER to make available to readers more information which will help increase profits, the editors of *American Agriculturist* have prepared several mimeographed bulletins on timely subjects. These are available to any reader without cost other than 3c each to cover mailing and shipping costs. Bulletins now available are:

- ☐ No. 101—HOW TO RAISE BABY CHICKS.
- ☐ No. 102—PULLORUM DISEASE OF CHICKS.
- ☐ No. 103—HOW TO CONTROL MASTITIS.
- ☐ No. 104—HOW TO BUY A HERD SIRE.

Check the ones you want, include mailing cost, and return the coupon to *American Agriculturist*, Box 367-S, Ithaca, New York.

From time to time we plan to make additions to the list available.

ple to the city, but you can't take the country out of them. I want them to have what they want. They were by here and liked this. They have all kinds of money, and can pay any price. How much do you want?"

They came in to see the house. When they got inside, the man said, "You know you have a film growing over your eye."

He asked to look at it, and told me all kinds of stories about going blind over night, having a shock, etc. He scared me so that I bought glasses, paying \$10.00 cash. Away he went. I never could wear the glasses, and soon found he was a fake.—Mrs. E. H. K., Maine.

* * *

A Tight Fit

A customer of mine, while he was making his rounds one day, was stopped by a stranger as he came out of a house. This man had two sweaters and said he wanted to get rid of them at a sacrifice because he was due in court in a town fifty miles away to answer to a speeding charge. He asked \$10.00. He called them 100 per cent wool, and exposed part of the label, which on later examination proved to read "100 per cent Camel Style." He also had an electric razor which he would throw in for a quick sale.

He allowed himself to be talked down to \$5.00 for the articles, and promptly disappeared. The razor could be bought for less than \$1.00, and the two sweaters proved to be a good grade of cotton and just large enough for a good sized baby. Needless to say, my customer is a big man, and they were guaranteed to fit him.—N. G. M., Massachusetts.

* * *

Not Ordered

"About two weeks ago I received two neckties, cost \$1.00, and 3c return postage if I did not keep them. I have received two postal cards since the arrival of the letter and ties. As I did not send for the ties, I ignored same. What I would like to know is, do I have to send those ties back?"

You are under no obligation to buy these neckties or to return them. Neither do you have the right, strictly speaking, to use them. If you wish, you can write to the company that you will be glad to give them to any representative that calls for them.

In our opinion this sending of merchandise through the mails is somewhat of a nuisance and the best way to stop it is for the public to make such selling methods unprofitable. Usually when such merchandise is received, it is accompanied by an appeal for sympathy on the part of the buyer. In some cases investigation has shown that any sympathy given is misplaced.

* * *

No Address

"In response to an advertisement in a magazine, we sent one crate, or 72 lbs. of rabbits to Jack Green, Box 195 D, Accord, New York. Later on, we sent him 8 Virgin Does, for which he agreed to pay 18c per pound. We received no pay for either shipment, and can get no reply from him. We have shipped hundreds of rabbits, but this is the first time we have had this experience."

The letter we directed to Mr. Green has been returned, indicating that the buyer moved but left no address.

* * *

John Brezina, 1007 North California Avenue, Chicago, Illinois, is very anxious to get in touch with Max J. Doerr, formerly of North Lockwood Ave., Chicago; but now reported to be on a farm in the State of New Jersey.

We are glad to carry this note as a service to both men involved.

"Remarkable Performance"

SAY THE MANY USERS OF THE NEW

DE LAVAL MAGNETIC SPEEDWAY MILKER

Here's What It Will Do For You

- Milk your cows in the best, fastest and cleanest way.
- Help you get best yearly and lifetime production from each cow.
- Enable you to increase your herd without extra milking help.
- Save valuable time and labor.
- Reduce costs and increase profits.
- Help produce highest quality milk.
- End the drudgery and fatigue of hand milking.
- Give you more time and money for other things.
- Increase the pleasure and interest of dairying for the entire family.

TRY IT

Without Obligation

The sensational milking performance of the new De Laval Magnetic Speedway Milker has earned the complete satisfaction of its users and is a continual source of pleasure to them. It more than fulfills every claim made for it and entirely justifies the reputation "Best, fastest and cleanest milker."

Find out for yourself—you can try the new De Laval Magnetic Speedway Milker on your own cows without obligation. And when you do, be prepared for a pleasant surprise. See your local De Laval Dealer or mail coupon.

It's Time to Plant Corn

This excellent yield of 29-3 corn was grown on the Charles West farm at Phelps, N.Y. last year. Western hybrids need a longer growing season, so they are not likely to do so well in this climate.

Good insurance against a possible shortage of hay next winter is a few extra acres of corn for the silo. If there isn't room in the silo for all

the crop, the surplus may be fed green in the field, or run through the silage cutter and fed in the barn during the fall and early winter.

Most corn planters use an edge-drop planter plate. The uniform, flat kernels of super-graded seed fit the slots in the plate, and plant evenly without jamming or skipping. Drills or planters with round-hole plates can use the round kernels from super-graded seed, which cost much less and give equally good yields.

Corn Varieties. When a lot of farmers in one neighborhood get good results with a certain corn variety, that's a good kind to grow. Silage varieties recommended for G.L.F. territory are shown below.

Recently hybrids have been developed which will out-yield most of our well-known varieties if grown under the right soil and climatic conditions. Hybrids which do amazingly well in the Midwest are not adapted to the cooler

climate and shorter season of the Northeast, and cannot be expected to give good yields.

Adapted Hybrids. The hybrids proved to be adapted to this region are Cornell 29-3 for New York State (except the lower Hudson Valley) and Northern Pennsylvania; New Jersey Hybrids #2 and #4 for New Jersey. Unless you can get one of these, it's better to stick to a standard variety which has done well in your locality.

Fertility. Corn needs fertile soil. On manured land, 400 pounds

This photograph, taken in 1927, shows Professor Bussell of Cornell and A. L. Bibbins, head of G.L.F. seed service, inspecting a field of West Branch Sweepstakes on the farm of George Slocum at Milton, Pa. Mr. Slocum, one of the earliest G.L.F. contract seed growers, is still growing seed corn for G.L.F. patrons. Years of selective breeding have continually improved the yielding ability of G.L.F. strains.

of 20% superphosphate per acre should be applied in the drill or planter, if superphosphate has not been used in the stable. Where corn is grown on unmanured land, use 300 to 400 pounds of 5-10-5.

Weeds and Birds. A dollar's worth of G.L.F. Crow Defeat will treat enough seed for 10 to 15 acres, and will keep the birds from pulling the corn. Weeds are not so easy, but they must be destroyed if the corn is to make a good crop. Start cultivating right after planting, before the corn is up. Until the corn is 2 inches high, you can go over the field with a weeder or peg-tooth harrow without injuring the plants. Cultivate frequently and carefully until the corn is about knee-high.

Home Garden Hints

The late, wet season has delayed work in the garden as well as in the fields. Peas should be in before this, but if they aren't you can prolong the enjoyment of fresh garden peas by planting three varieties at one time—

Early Gradus or World's Record for early maturing.

Thomas Laxton or Laxton's Progress for second early.

Alderman for a late crop.

A home-made "planker" or "float" is a good tool to smooth and fit the seed bed after final harrowing.

Larger and earlier yields of tomatoes are reported by commercial growers who use a transplanting solution at setting time. In New York and Pennsylvania the 11-32-14 transplanting mixture is recommended at the rate of 5 pounds for 50 gallons of water. Use $\frac{1}{4}$ of a pint per plant in the hole where tomatoes or cabbage are to be set. For melons, peppers and egg plants, the solution is 4 pounds per 50 gallons of water. In New Jersey 8-24-8 Transplanting Solution has been successfully used at the rate of 2 to 4 pounds per 50 gallons of water.

Some nurseries recommend Vitamin B₁ for use at transplanting time. It may be helpful if used with a root starting solution such as indole-acetic acid. Vitamin B₁ is manufactured naturally by the leaves of plants in sunlight and is sent to the roots where it helps promote root growth. Limited experiments with a manufactured Vitamin B₁ have copied these natural processes on plants grown in sterile sand. The work is still in the experimental stage. The important thing is to know that plants do this work naturally, given good sunlight and fertile soil with the necessary humus.

Early beets for the table, late beets for canning. Beets are also an excellent indicator of soil acidity. If beets grew poorly on the garden plot last year, the land probably needs lime.

Carrots should be planted early and at one time because of their long maturing period. Beans on the other hand can be planted from May 1 to July 15, to stagger the maturing time for continuous table use and to better regulate canning.

Have you received your copy of the Home Garden Guide?

SILAGE CORN VARIETIES

Variety	Where Adapted	Maturity
West Branch Sweepstakes	New York, and Northern Pa. (not over 1000 ft. elevation)	115-130 days
Cornell 29-3	New York and Northern Pa.	Slightly earlier than West Branch Sweepstakes, about same as Cornell 11
Lancaster Sure Crop	New York and Northern Pa.	Little later than West Branch Sweepstakes—earlier than Lancaster
Early Golden Glow	High altitudes of New York and Northern Pa.	Earlier than Cornell 11. Especially cold resistant
Early Butler	Northern Pa. and high elevations of New York	90-100 days—early husking
Delta	Below 1000 ft. elevation in New York and Pa.	Later than Lancaster Sure Crop, earlier than Eureka
Leaming	New York and Northern Pa. and N. J. at lower elevations	Later than West Branch Sweepstakes and Lancaster
Pride of North	Low elevations of New York and Pa.	Later than Lancaster and Sweepstakes. Earlier than Leaming
Late Eureka	New Jersey and Northern Pa.	Late—never matures in G.L.F. territory
N. J. Hybrid #2*	Throughout New Jersey	115-125 days
N. J. Hybrid #4*		110-115 days

AMERICAN AGRICULTURIST

THE FARM PAPER OF THE NORTHEAST

NEW ENGLAND

NEW ENGLAND farming is suffering from an inferiority complex. Much has been said about the big industrial developments in this region, but New Englanders are overlooking the fact that these six northeastern states are still doing a big job in the production of farm products.

There are two reasons, as I see it, for this feeling of inferiority in respect to agriculture. First, the extensive publicity given the industrial situation has focused public attention on industry and business; and secondly, (and most important), we think too much here in terms of individual states. If we compare the agricultural output of a single New England state with that of a large western plain state, our farming activities may look small.

But I don't think that's the way to look at it. We should think of New England as a unit.

After all, the only reason for New England being cut up into such small pieces is that it was settled in the early days, when land was allotted to the various colonies. All this happened before anyone could foresee the eventual development of this vast United States. If this nation had all been settled at

Land of Farms

By WALTER PIPER

EDITOR'S NOTE: *If you add to the farming of New England, so well described by Mr. Piper in this article, the farming of New York and New Jersey also—that is, if you consider the agriculture of all of this great Northeast of ours—you have one of the greatest agricultural sections not only in America but in the whole world.*

once, chances are that the states would have been more nearly equal in size. Chances are also that New England would have been one large state rather than six small ones.

Do you realize, for example, that all New England combined is only three-quarters as

large as Kansas, about 60 per cent as large as Colorado, one-quarter the size of Texas?

Get down the atlas and look at most any of these much publicized agricultural states in the corn belt or elsewhere and you will find that each one of them has as much or more land than all six Yankee states put together. Let's discuss the situation, therefore, from the standpoint of a united New England. Then let's see how this New England of ours stands in respect to its agricultural importance.

Probably the most important measure of success in farming or any other business is cash income. Compare New England as a unit with the rest of the country and you will find that there are only twelve states in the whole country that exceed New England in farm income. The total income of New England farmers is greater than that of such big farm states as Nebraska and Kansas. It is more than that of any southern state except Texas and North Carolina.

The much advertised state of Washington gets the benefit of Pacific Coast big talk, but when you get down to cold facts you find that cash income for that state is only about half as much as that of New England. If you want more evidence of Yankee (Turn to Page 11)

—Photo by Ewing Galloway, N. Y.

BRINGING HOME THE COWS at chore time in New England, one of the most familiar of all farm scenes. Dairying in the Northeast represents more than half of the farm business, with a total income from cows in New England of \$50,000,000 a year and more than three times that amount for the northeast section. Poultry for the northeastern section represents another \$60,000,000 income per year,

with vegetables and fruit making a close third. Many other farm enterprises make the Northeast one of the most diversified farm regions in the world. That is one reason why farmers here have been able to stand off the depression better than most others. Over half of Northeast farms are free from mortgage.

Read Mr. Piper's article (above) and you will agree that we still farm in New England.

No "Grade A" Milk After September 1, Page 12—Haying in the Rain, Page 7.

**YOUNG MEN
WANTED NOW**

IF YOU ARE 18 TO 25

**THESE ARE THE MOST ENCOURAGING
WORDS IN THE ENGLISH LANGUAGE**

WE IN DEARBORN again want to demonstrate our belief in the land. The future of America depends upon its well-being.

But *men* make the land. And it may as well be said, bluntly, that the *young men* of today have come to doubt their opportunity.

It is hard to believe in opportunity that hasn't come your way. Thousands of young men who read this message know exactly how that feels.

They are healthy, able, ambitious. But they cannot get started. They are asked for experience, but they are unable to obtain it. Yet they know that somehow, some way, they *could* become useful members of the community, given the chance to show their worth.

The opportunities in our America *are* greater than ever. Youth *has* the talent. And we who are responsible for the Ford tractor with Ferguson system believe that youth and opportunity *can* be brought together.

To this end, and in company with our distributors and dealers, we are establishing the NATIONAL FARM YOUTH FOUNDATION, which will make genuine opportunity available immediately to thousands of young men in the rural communities of America.

Details of the Foundation are given elsewhere on this page, and a fuller explanation of its purpose and plan is contained in our book "A New Career for the Young Men of America."

In brief, the NATIONAL FARM YOUTH FOUNDATION is organized to give thousands of young men the *three fundamentals* needed for a real start in life: A specialized education, a personal training, and practical experience.

The *thoroughness* with which these fundamentals will be acquired, and the very *means* by which they will be acquired, are in themselves an unusual assurance that members may more easily achieve their ambitions in farming or other permanent employment.

But in addition, the NATIONAL FARM YOUTH FOUNDATION will reward a large number of its most diligent members with salaried jobs, or with tractors for their farms, depending on the particular talents they display.

Thus, starting right now, and during the coming months, thousands of young men will be realizing for the first time that opportunity can be real, and personal.

We look beyond these thousands of Foundation members, and see a new thing happening to the rural communities of America. We see ambitions gratified, needs filled, leadership in the making. We see young men with heads up, families with new hopes, local businesses with new inspiration. We see the land improved by better men. And all that means a better America.

The NATIONAL FARM YOUTH FOUNDATION has been instituted with this vision before us. It gives meaning to the words: Young Men Wanted Now.

The NATIONAL FARM YOUTH FOUNDATION is sponsored by Ferguson-Sherman Mfg. Corp., with the co-operation of Henry Ford, Founder, and Edsel Ford, President, of the Ford Motor Company.

© Ford Motor Company

NATIONAL FARM YOUTH FOUNDATION

Established to bring opportunity to the young men on the farms of America, and to aid them in obtaining permanent employment.

Who are eligible: Young Men 18 to 25 living or working on farms. Details in book "A New Career", obtainable from dealers who sell the Ford tractor with Ferguson system.

Education: Every member receives without any obligation whatever a course in FARM ENGINEERING AND MANAGEMENT specially prepared by La Salle Extension University. The price, if regularly offered, would be \$136.

Training: Every member will receive local class and individual training in tractor operation and management, and in the use of implements.

Experience: Every member will be afforded opportunity to gain practical experience in demonstration and sales work.

Special awards: Every member *may* also compete for these awards:

1. 29 salaried jobs, with one-year contract at \$150.00 per month with Ferguson-Sherman Mfg. Corp. Further training suited to each man's talents will be given during this employment.
2. 29 salaried jobs, with one-year contract at \$125.00 per month, with Ferguson-Sherman distributors.
3. 725 men will be placed upon an Honor Roll for additional jobs as they develop.
4. Still another 29 members will receive a Ford tractor with 2-bottom 14" plow, as winners of a tractor operation competition to be held in each distributor's territory.

(In case of ties, duplicate awards will be made.)

How to enroll: See the local dealer who sells Ford tractors with Ferguson system at once. If you do not know who he is, write NATIONAL FARM YOUTH FOUNDATION, Box 329, Dearborn, Mich. Do not delay. Nothing has to be paid, or bought, or sold.

"We Want Flint Corn— But Try and Get It!"

By VREST ORTON.

"WANTED—A Double-Crossed Flint Corn." That headline in a recent article in the *American Agriculturist* got me all excited. The Vermont Guild of Old Time Crafts & Industries in the Vermont hill village of Weston has been trying for weeks to buy, beg, borrow or steal some flint corn . . . all without success. After wearisome and amusing attempts to deal with un-imaginative grain dealers of Vermont, I begin to feel that there is more truth than poetry in your headline. For I feel sometimes as if I had been *double-crossed by flint corn*. At any rate, I am left in a bewilderment. I seek light.

Perhaps I'd better explain, because the above paragraph sounds a little cryptic to the general reader.

The Vermont Guild of Old Time Crafts & Industries is composed of people all over the country who have joined together to revive the best of the early crafts and industries. We have set up what we call a *working museum* because some of the exhibits will work. Instead of a dead, static museum, ours is a live and moving museum. For example: instead of setting up an old-fashioned stone grist mill and letting people look at it . . . we have set up such a grist mill, 150 years old, and with our water wheel we are making it turn out corn meal. Thus it serves two purposes: shows how things were done in the early days and turns out corn meal vastly superior to the commercial meal being made today.

There's a very good reason why this stone ground meal is superior. It is ground slowly and painstakingly between cool stones. The most important part of the corn is the germ, very rich in Vitamin B-1. In commercial corn meal, which is ground in a high speed modern steel mill, the meal is heated so this germ is affected and has to be removed. But in our process cool stones grind this germ right into the meal and thus our corn meal contains all the essential elements of the whole corn. Every old-time miller knows this.

Since we started grinding we have used the old-fashioned Vermont corn commonly called by old-timers *Indian Corn*, but in reality the best No. 1 Flint Corn. Fortunately we have had this raised for us by a farmer who was blessed with foresight and intelligence but the unexpected demand for our meal has used up our supply. We

started out recently to find more flint corn.

And what do you suppose was the result? I wish I could relate all of the amusing and sometimes aggravating experiences I had with grain dealers. Every time I called one up on the telephone, or wrote one a letter, or saw one, invariably the following conversation took place:

Me: "Have you got any flint corn?"

Dealer: "What do you want of flint corn?"

Me: "I want to grind it into corn meal at our mill."

Dealer: "You don't want flint corn—you want western corn."

Me: "I think I know what I want."

Dealer: "But you don't want flint

corn—we ain't got any, anyhow."

Me: "Say, who in h— is buying this corn? I know what I want and what I want is flint corn!"

Dealer: "Well, we ain't got any."

One dealer with whom I spent half an hour on the telephone explaining what we were doing at our mill in Weston (it was 38 miles from him but he had never heard of it) and how I wanted so many pounds of flint corn to grind the next day said he would send some up. The next day (it was in March and the mill was frozen up) we spent thawing out the mill. At six that night after a hard day's work we were all ready to start grinding. The truck pulled in and deposited a half dozen hundred-pound bags on the platform. I hurried through my supper, got the miller and in hearty eagerness we hauled the bags into the mill. We opened a bag. A howl of anguish went up to high heaven. It was a bag-full all right, but it was full, not of whole corn we had ordered but of corn meal—all neatly ground in the dealer's high speed steel mill!

I could cite several more instances

of grain dealers in Vermont who refuse to understand that an old-fashioned stone mill can grind flint corn into corn meal and sell it to thousands of people throughout the United States.

Farmers too. We sent out dozens of letters. The newspapers and farm journals printed notices all through the state of Vermont that we wanted to buy flint corn, paying higher than market price. Even the Department of Agriculture and the Governor of the state got busy and made inquiries. And what was the result? Not one single bushel of corn did we discover.

The mystery begins to deepen. The dealers in Vermont tell me there is no such thing as No. 1 Flint Corn. They consistently reiterate that the only thing flint corn is used for is seed. The following conversation always takes place:

Dealer: "We have a little flint corn but it's for seed."

Me: "But if it is used for seed, somebody must raise it. What happens to the corn they do raise?"

Dealer: "Well, they use it for seed."

(Continued on Page 15)

Farmall-B and No. 16-B Mower. This mower and the No. 16-A for the Farmall-A have a "V-belt drive," operated from pulley on power drive shaft. Quiet, flexible, efficient.

HAYMAKING hits new highs in efficiency this year with the modern McCormick-Deering Hay Tools designed to match the speed and performance of the new Farmall Tractors.

Two new mowers for Farmall-A and Farmall-B lead the parade. You'll want to see them and try them in your fields. They whir along behind the Farmalls at speeds up to 4¾ miles an hour. Another new machine is the No. 25 Tractor Mower. It is easy to attach and detach, fits practically any farm tractor, and is an ideal all-around mower. Quick-attachable mowers are also available for the Farmall-H and Farmall-M.

This year, too, we introduce the McCormick-Deering Pickup Baler, a handy, time-saving machine that picks up and bales the hay as you drive along down the windrow.

The complete McCormick-Deering line includes mowers for both horse and tractor operation, dump rakes, tedders, side-delivery rakes, loaders, green crop loaders, stackers, hay presses, and hay choppers. Be ready to go when haying time comes around. See the International Harvester dealer now.

THE *Editorial* PAGE

BY E. R. EASTMAN

Address all mail for Editorial or Advertising departments to American Agriculturist, Savings Bank Building, Ithaca, New York.

"A wedge from itself splits the oak tree"

Here's an old country saying that applies to individuals, cooperative organizations, and to nations. The most dangerous enemy is the one from within.

How Much Will Farmers Stand?

ATTENTION of all dairymen shipping milk to New York City is called to the article on page 12 explaining the new city Board of Health regulations. Dairymen will remember that the Board of Health first announced a complete elimination of Grade A milk, stating that after September 1 there would be only one grade. More recently they have announced the regulations for the new grade.

We said from the first that this was just an excuse to jack up the requirements and the costs of milk production without putting up the price to farmers. In other words, it is another example of bureaucratic regulation whereby all dairymen are being worked toward Grade A standards for the same old Grade B prices.

Some time farmers are going to get tired of all this regulation business, and when they do, some of the bureaucrats had better hunt cover.

Biggest Dairy Campaign in History

THE DAIRY industry has set aside June for one of the greatest food consumption drives ever staged. Dairy farmers, distributors, ice cream and dairy product manufacturers, newspapers and the farm press, the radio, and more than 300,000 food drug and variety stores, hotels and restaurants, will work together to emphasize the value and the need of dairy products.

Plans are under way to reach practically every consumer in America, and that includes the farmer himself. If every farm family would increase its milk consumption a quart a day, its butter an extra pound or so a week, and add cheese to the daily diet, there would be no surplus. Better still, the health of every member of the family would be improved.

American Agriculturist always gets behind these campaigns and movements to help farmers. But sometimes I feel a little discouraged, because there is not much use of our taking time and energy and valuable space if farmers themselves don't think enough of their own products and business to use these same products more liberally themselves, and to shout their good qualities from the housetops at every opportunity.

The Lights Will Burn Again

AN EDITORIAL in a Denmark paper, written after the German invasion, complains bitterly that the Danes have been put on short rations so that the food which they raised themselves could be fed to German soldiers.

Before the invasion some 250 million pounds of butter, 100 million dozens of eggs, and 400 million pounds of pork were exported by Denmark annually to Great Britain. After the invasion of course these exports ceased, and Great Britain had to turn to other places to replace these big supplies of food. She will, of course, trade with her colonies first to make up these supplies, and then, if she cannot get enough, or if food has to be shipped too far, she will turn to America, and that may mean increased exports of farm products and better prices to our farmers.

The same editorial mentioned above concluded as follows:

"Yes, the lights are blacked out in Denmark. We don't know how or when they will be lit again, but sometime the lights of Denmark will burn again."

So they will also in other countries where freedom is temporarily blacked out, for that spirit is unconquerable. It is like truth itself which, crushed to earth, will rise again. So we may say with James Russell Lowell in his great poem, *The Present Crisis*:

"Careless seems the great Avenger; history's pages but record

One death-grapple in the darkness 'twixt old systems and the Word;

Truth forever on the scaffold, Wrong forever on the Throne —

Yet that scaffold sways the future, and, behind the dim unknown.

Standeth God within the shadow, keeping watch above his own."

Do You Want Northeastern Slants?

THE HARDEST job in the world for an editor is to find out what his readers want. We of *American Agriculturist* are constantly studying this problem. We read the large number of letters that come from our subscribers, eagerly looking for suggestions, and I am always asking for suggestions. That we are making some progress is indicated by the very evident growing interest of our folks in *American Agriculturist*.

Starting with this issue we are going to try another editorial experiment, and it is up to you whether we continue it or not. For many years we have conducted a department in *American Agriculturist* known as Northeastern Slants. To prepare this, the staff spends hours and hours of labor reading magazines and newspapers. Then

"A bit of fancy whittlin'", says Mr. David Gaines of East Hartford, Connecticut, who on March 1, 1940, resigned as postmaster of that town after having served in that capacity for 35 years. Mr. Gaines is 85 years of age.

I wonder if the fine art of whittling is disappearing. I haven't seen any since I was a kid. Remember the old retired sea captains who used to whittle out beautiful ship models?

we write a short news summary, followed often by a slant or editorial opinion. We don't know how well this department is read, so we are going to leave it out for a time, and permanently unless we hear from a large number of you to the contrary. In its place I am going to take both this page and the next one for frank personal visits with you on farm, home, national, and international problems, particularly those that most affect your business and your lives. On this page also I hope to print a lot of short letters from you, followed by our own brief answer or comment.

Let me know if you like or don't like this change. Read the opposite page this time as an example of the kind of thing I hope will please you.

What Farmers Think About Fool Time

SINCE my editorial against Daylight Saving, the letters have come pouring in from farmers, showing what a great nuisance and problem Daylight Saving is to a majority of them. Here is one, for example, that business men in small cities and towns should take to heart:

"Yes, this fool time is a nuisance. When we want to go to town, church or any doings, we are greatly inconvenienced. *So we just don't go.* As for trading in town, they get a small share."

Another farmer writes:

"When a few 'white collars' get together and send a petition to the village board to pass a resolution to tinker with the clocks I think they are taking too much authority, and it is being done all over the state."

The trouble is, though, not all farmers are unanimous about fool time. I have one letter that tells me to mind my own business, that I don't know what I am talking about, that the farmers of his community want Daylight Time.

Here is a letter that raises one of the most important objections of all:

"I was much pleased with your editorial entitled 'Let's Raise a Little Hell'. Only you should have used the word 'big' in place of 'little'. As our township has no high school, we have to send our high school children to either of two neighboring towns and we have no vote in either place. Our transportation contract calls for our children leaving for school at 7:30, but because of Daylight Saving our children have to leave at 6:30. That means that we all have to get up about four o'clock in the morning, do the chores and hustle to get some breakfast before the children can get the bus, and there is nothing right nor fair about it."

The farmer who wrote the following letter has the right solution:

"The time is at hand for the rural organizations, particularly the Granges, to endorse the action of the State and National Grange, and offer vigorous protests to the officials of small cities and nearby villages, and as Master of one of these granges that is just what I am going to do."

Well, just how much do you dislike Daylight Saving? If farmers get mad enough, they can at least throw it out of the small towns.

Eastman's Chestnut

THE SPEAKER was bragging about the way he had travelled, and where he had been.

Said a drunk in the audience: "Ever had Delirium Tremens?"

"No," said the speaker.

"Then," said the drunk, "you ain't been nowhere nor seen nothin'!"

A Northeast Journey

With THE EDITOR

By E. R. EASTMAN

IN SPITE of the fact that I more and more dislike being away from home, I am always well repaid for the hardships of travel when I journey across this magnificent northeastern farm country of ours. I have just returned from a quick trip of not much over one day, covering well over a thousand miles in New York and New England, and I want to invite you to retrace with me in spirit this journey, to see our Northeast beginning to bloom forth in another springtime.

I left Ithaca, in the Finger Lakes country, late Monday afternoon, May 13, and drove fifty miles to Syracuse, through one of the greatest dairy sections in the world. Then by sleeper across New York and New England to Boston-town, by automobile from Boston northward to St. Johnsbury, Vermont, and thirty or forty miles more to Vermont's capital city, Montpelier. From Montpelier I came back by airplane to Boston, took another sleeper to Syracuse, and so back to Ithaca.

Pastures Are Good

The farm pace, like the European War, had reached its furious stage. Every farm was the scene of intense activity. Oats, of which there are few sown anywhere, were going into the ground like nobody's business. The season everywhere in the Northeast is

from one to two weeks late, but it won't take long for farmers to catch up. Pastures and meadows H A V E caught up. I was surprised to see cows out almost everywhere this

early. The heavy rains have brought on the pastures rapidly and new seedings and old meadows which were not injured by the drought last summer are looking good. With rain from now on, the hay crop may not be so short after all, and we may have a big flush of milk in June if pastures continue as well as they have started.

New England, Land of Churches

At Boston I was met by a party of friends, and for five hours we wound our way northward across northern Massachusetts, then for mile after mile in fine old New Hampshire, till we finally crossed the Connecticut River and were in Vermont at St. Johnsbury. Trees were just beginning to show that first tender green of early spring. So beautiful are some of the long tree-bordered New England roads that it makes one catch his breath to come around a corner and look off ahead. Most striking of all are the New England churches, which almost always stand on a knoll, where their simple, graceful lines and steeples can be seen for miles as you approach the villages. New England is a land of churches.

I saw the campus of the Phillip Andover Academy, where many generations of boys have been prepared for Harvard and for other colleges. Most interesting is the model town of Shawsheen in Andover, the dream of a millionaire mill owner and operator, who set up his ideals of a village and homes for his workers. His ideal failed. I don't know the reason, but I would guess that it failed because no individual and no government, no mat-

ter how well intentioned, can live people's lives for them.

At Franklin, New Hampshire, we saw the beginning of a gigantic dam being built by Army engineers to control New England floods. When the dam is completed and the water fills in, it will cover hundreds of homes and farms, including one whole village. Determined not to have their village spirit thus destroyed, citizens of Hill Village, now located back of this dam, have decided all to move together and to set up a new Hill Village. This time I hope it will be on a real hill.

A Statesman's Birthplace

High point of the trip for me was when we turned off north from the main road in central New Hampshire to visit the birthplace of Daniel Webster, and I had the privilege of standing with bared head in the little two-room cabin where one of the greatest statesmen first saw the light. He was born in 1782 and died in 1852. To me particularly it was hallowed ground and like coming home, for Daniel Webster was my great-granduncle, and his sister Sally was my great-grandmother. The State of New Hampshire maintains the cabin, the flag that Webster did so much to uphold and preserve floats over it. Back a little in the yard is an elm tree, the biggest I ever saw, which was planted by Daniel Webster's father. The tree is so old that the State has spent \$5,000 on it keeping it wired together and alive.

As we drove up the side road to the Webster home, over poor land, and through a country mostly covered by brush, I thought of what Daniel once said about that early home of his:

"My father lapped on a little beyond any other corner, and when he had built his log cabin and lighted his fire, his smoke ascended nearer to the North Star than that of any other of His Majesty's New England subjects. His nearest civilized neighbor on the North was at Montreal."

We Still Farm in New England

We arrived at St. Johnsbury at two o'clock, just in time for my address to the annual meeting of New England Dairies. Enthusiastic as I always am over our agriculture here in the Northeast, I told the members of this great cooperative dairy organization that they should be proud of New England's agriculture and of the dairy industry of New England. I emphasized some of the facts so well brought out in Mr. Piper's story about New

England farming on the first page of this issue of *American Agriculturist*, and said that in spite of the fact that a lot of people in Washington and in the West never could see our farms because they were overshadowed by our skyscrapers, we do

still farm here in the Northeast. I pointed out that we hear a good deal more about wheat and corn and other farming than we do about dairying, although dairying is the largest farm industry in America. One out of every fifteen American families gets its livelihood from dairying, and if all the

milk produced by the dairy farmers of America was put together in a river it would be 40 feet wide, 7 feet deep, and would reach from San Francisco to New York City. That's how important dairying is, and it produces over half of the farm income in New York and New England farms. That's why it is necessary for dairy farmers to stop quarrelling and fighting among themselves and work together in such organizations as the New England Dairies in order to get a living price for milk. The meeting was very well attended—Reports show increased membership, finances in good shape and general progress.

A Real Farm Governor

After the meeting, a cooperative creamery manager and some farmers very kindly gave me a ride from St. Johnsbury to Montpelier, Vermont's capital city. I have tremendous respect for Vermont and for its people. Probably more than any other state, unless it is Maine or New Hampshire, Vermont comes nearest to being a true democracy, governed by its citizens. Seated alone at a

Daniel Webster

table in a little tavern where a friend of mine and I ate supper that night was the Governor of the State, George D. Aiken. Afterwards he was around the lobby, visiting with somebody or sitting quietly by himself reading his newspaper, exactly the same as the rest of us were doing, and attracting no more attention than anyone else. That would not have been possible in any other state in the Union that I know anything about, and never under any circumstances in any other country in the world. Governor Aiken is a true representative of a democratic government in a real democracy. In a brief visit which we had with him he told of just getting back from a meeting, I think he said in Rhode Island, where he had discussed the need of monetary reform, and suggested that it was the only way by which injustices to farmers and other producers of raw materials could really be corrected.

How to Help Farmers

On that trip from St. Johnsbury to Vermont, I asked the farmers in the car how they would make *American Agriculturist* more useful to farmers if they were the editor? They gave me two suggestions. Said one of them:

"What we need is all the help we can to put up and keep up the price of milk."

Well, of course, *American Agriculturist* has worked on that job, as well as for better prices for all farm products, ever since I can remember. The best and shortest way to do this is to correct the dishonest dollar. The other is by better organization.

The other suggestion, made by a farmer in our party was to get farmers themselves to increase their use of

milk and other dairy products. He spoke of what large users of oleo even dairy farmers are, and it was agreed that if every farm family would use even a pint more a day of milk, with some more butter and cheese, it would take care of the surplus.

All the way up from Boston to Vermont, almost every farm had the *American Agriculturist* Service Bureau sign prominently displayed. I always feel at home when I see that little sign, and it always makes me feel like doing more and more to make *American Agriculturist* justify the confidence of farmers in it.

No Sirup on the First Pancakes

Vermont, as you know, is the greatest maple sirup and sugar section in the world, with New York second. Production this year was excellent. New York had one of the best seasons in several years. Vermont production also was above average, and quality both in New York and New England was high. Prices at the end of the season were about the same as last year at the farm. Sirup sold at an average of about \$1.82 per gallon at retail and \$1.42 wholesale, with sugar 29c at retail and 25c at wholesale. Better packaging and marketing methods, of course, brought better than average prices.

In this great sugar section it was natural for us to get to talking about it. It seems that people who are not brought up to maple sirup and sugar don't care much about it. They don't know what they are missing. I remarked that Mother would never let me have all I wanted of it, although we used to make lots of it when I was a kid. Always we had to eat two or three pancakes first before we could put sirup on the last ones. Strange how common those old Yankee customs were! It seems that every other man in the car also had to get along without sirup on his first two or three pancakes, back in those good old boyhood days.

God Save America!

As the sun was going down over the Vermont hills, my friend Mr. Bronson and I climbed into an airplane at Montpelier for the trip back to Boston. As you look down on the Green Mountains and the White Mountains

and all the woods in New England, you wonder where the farming is. But it's there, as is also the scenery. Looking out of the plane window, Mr. Bronson said to me:

"There is probably no place in the world where utility, including farming and manufacturing, much of which is made possible by New England's great water power, is so mixed with magnificent scenery as it is in this New England of ours."

As I saw the blue haze, and finally the dark, closing down over the old hills, those lines from our national hymn "America" had deeper meaning for me:

"I love thy rocks and rills
Thy woods and templed hills."

Then, a little later, we saw the twinkling lights outlining the crooked streets of the Yankee's biggest town, and I thought how different it would be if this airplane were carrying bombs of destruction, and if it were necessary for all the lights of that great town to be blacked out. Let us pray that this awful conflict across the water may cease and be settled; let us hope and pray that the blackout and all that it means in destruction and grief may never come to America.

Why SALT is so important

just before and just after calving time

BEFORE. A cow deprived of salt for 9 months. Note rough coat and bad condition.

AFTER. The same cow 5 months after salt was correctly restored to the diet.

FARM ANIMALS need salt most just before and just after bearing young. See in the above pictures what happens to a cow deprived of salt. To build up bones and create new balance in blood and tissues to feed new-born animals, the mothers need ample supplies of salt, as well as other minerals.

This is one of many ways in which International salt can earn more for the farmer in proportion to its cost than any other thing he buys for profit.

Learn how to use salt to save time and make money. Write for a copy of the farm salt book shown below. International Salt Company, Inc., is one of the largest producers of salt in the world—preparing all types and grades of salt for farm use. Ask for International brands by name.

INTERNATIONAL SALT COMPANY
INCORPORATED
SCRANTON, PA. NEW YORK, N. Y.

At left are two correct grades of International salt for live stock feed.

THE STERLING 5¢, 24-oz. square package of table salt is convenient and economical. Sterling Salt is steam-sterilized.

FREE BOOK

Write today for a free copy of the book, "White Gold for the Farmer's Profit." It contains correct advice for uses of salt everywhere on the farm and in the farm home.

for the farmer's profit

BABY APPLE TREES

By ED. W. MITCHELL

IT IS pretty hard to know what to do with a young apple tree that starts out with as many branches as the ones in these pictures. Someone was not on his job when that tree was set, nor for the first year or two of its life. The time to start shaping a young tree is the day it is set, and the time to continue the shaping is all the time.

Another problem that perplexes some of the more fortunate, is to find some profitable use, or at least some

A useful task for a young granddaughter—showing the difference between a low headed and a high headed apple tree.

distracting occupation for a little daughter, or grand-daughter about 3½ feet high. I rather pride myself on having such a grand-daughter, and especially in finding the useful job for her of serving to illustrate the difference between a low headed and a high headed tree.

The little lady measures 3 ft. 7 in. and helps set-off the heading of 18 inches as compared to 4 ft. That difference in the height of head is noticeable in pruning, spraying and picking; and in the amount of damage done by winds and storms. The low headed tree is so much easier to work in every respect except plowing and digging out borers, that it may spell the difference between profit and loss; although I hope our profits do not get down to as narrow a margin as that.

This last winter we took advantage of the deep snow and a fair crust, and ran through some ten year old trees with the two-foot pruners and got practically the whole job done without

the use of a ladder, and at about half what it would have cost if the trees had been higher, or the snow lower. I might add that the rabbits were just as smart as I was, and foraged above the guards, where rabbits are not supposed to be.

Speaking of rabbits and their brains, brings me back to the subject of plowing under and around young trees and into and out of mud holes.

For years I argued with the old German who helped me in my early days, about high-headed and low-headed trees. To him the most important factor to consider in heading a tree, was to have it high enough so one could plow under and around it without inconvenience. It took us many years to learn that it is cheaper to hoe or grub around the trees by hand than try and do it with a horse. We have even learned that a mulch will serve the purpose very nicely, and that one can keep away from the trunk of a young tree with the tools that cut and tear, to the mutual benefit of both trees and tools. Now the plowing is done where it is easy to do and does not damage the tree, and if a few blades of grass, or an occasional weed shows in the orchard, we manage to grin and bear it.

The same sort of dumb stubbornness possessed us about mud holes. For some reason, we felt that all of the farm had to be worked, and that every part of every field had to have the same sort of tillage or crop. Year after year we fought our way into and out of the mud holes and cat-swamps to make each field look like a garden. How dumb. It took several tough years to get us finally to abandon unprofitable fields or spots, pull the trees out of the wet spots and abandon them, and to learn to drive around a mud-hole rather than through it.

When I look back at some of the dumb things we continue to do on a farm, year after year, I take off my hat in respect to the little lady, who is pretty smart, at that, and almost to the rabbits—damn them.

Strawberries Need Humus

If the results from your strawberry bed have not been satisfactory, now is the time to look forward to coming years. The three important requirements for heavy yields of strawberries are: an abundance of soil moisture, plenty of plant food, and a good soil structure.

All of these conditions depend very largely on the amount of humus or organic matter in the soil, the lack of which is difficult to remedy after the crop is growing. Now is a good time to pick out the spot on which strawberries will be set out in 1941 and to grow a good cover crop on it to turn under.

If you want to do an extra good job, you might follow the practice of one man who grew and plowed under three cover crops in one year. Market peas were grown early in the season, and after the peas were picked, the vines were plowed under. Then buckwheat was sown and plowed under in the fall, and rye sown to be plowed under the following spring.

Root Stocks

What is meant by the terms "seedling root stocks" and "clonal root stocks" as applied to fruit trees?

Seedling root stocks are raised from seed, while clonal root stocks are propagated by cuttings, by layering, or by some similar vegetative method.

BRINGING UP FLOWERS

"BLACK LEAF 40" Kills by Contact and Fumes

"BLACK LEAF 40"

Don't be discouraged by insect pests. Get a bottle of "Black Leaf 40." One ounce makes six gallons of effective spray. Kills both by contact and by fumes.

Kills Aphis, Leafhopper, Young Sucking Bugs

HAYING in the RAIN

THERE has never been a time when farmers in general have been so ready to adopt new ideas as they are at present. Evidence of this is furnished by the rapid way in which the use of grass silage has been adopted. The trend to grass silage will continue, and each dairyman who tries it will adapt its use to the conditions on his particular farm.

Here are two obvious advantages: First, it allows a dairyman to cut his hay early when weather conditions are usually unfavorable to the drying of hay. Second, it provides an economical way to store succulent feed to use when pastures dry up and get short in the middle of the summer.

Because clover and grasses contain too little sugar to form enough acid to keep the silage, it is common to add either molasses or phosphoric acid when the grass is put in the silo. Some good silage has been made from grasses and cereals without the addition of either of these materials, but the more legumes you use, the more preservative you need. The following recommendations are made:

With grasses and cereals, use 40 lbs. of molasses to the ton; with mixed grasses and legumes, 60 lbs.; with clear alfalfa or clover, 80 lbs.; and with soybeans, 100 lbs.

Where phosphoric acid is used, the recommendations are: with legumes, 16 lbs.; for mixed grasses and legumes, 14 lbs.; and for grasses or cereals alone, from 9 to 12 lbs.

For some time there was argument as to whether or not grass silage exerted a greater pressure on the walls of silos than corn silage. Recently some actual tests were made, and it was found that grass silage does exert more pressure. Detailed information as to the necessity for reinforcing silos for grass silage is available from the National Association of Silo Manufacturers, Box 30, Norwich, New York. Send 12c to cover mailing costs.

Bulletin No. 391, "Legume and Grass Silage," is available to residents in New York State if they will drop a post card request to the Mailing Room, College of Agriculture, Ithaca, N. Y. Bulletin No. 362, "Haying in the Rain," is published by the Massachusetts College of Agriculture at Amherst; while Vermont College of Agriculture at Burlington has published bulletin No. 434, "Legume and Grass Silages."

You will find these bulletins very helpful in giving you more detailed information.

Setting Tomatoes

One of the biggest costs in growing tomatoes is the cost of growing or buying plants and setting them out. Figures show that this expense is about one-third total cost of growing tomatoes. However, this is a poor place to attempt to cut costs. The cost of

growing one ton of tomatoes depends largely on the yield per acre, and the use of poor plants is one of the best ways to reduce yields.

Plants that have been hardened for a week or more before setting will stand unfavorable conditions; but on the other hand, if conditions are favorable, hardened plants will not start off as rapidly as those whose growth has not been checked.

A useful and relatively new discovery is the use of a half pint of a starter solution per plant when tomatoes are set out. It gives them an excellent start. This starter solution is made by dissolving 3 or 4 lbs. of a mixture

made of 2 parts of ammophos and 1 part of potassium nitrate in 50 gals. of water. Setting tomato plants relatively deep helps to prevent drying out by dry winds or unusually sunny weather.

Late Cutting for Thin Alfalfa

Because the weather last summer was dry, a good many fields of new alfalfa are unusually thin. As a result, the hay crop this year will be small; but if conditions are favorable, the seedings may thicken up so that the 1941 crop will be satisfactory.

The best thing a grower can do to help thicken up the alfalfa stand for next year is to delay his first cutting of alfalfa on thin seedings this spring. This will give the plants a chance to get established and to thicken up.

Naturally, the quality of the hay

cut late will not be quite up to what it would be if cut early, but that would appear to be the lesser of two evils. Anyway, if you have much alfalfa, you can't cut it all the same day; so cut the old meadows first, and delay cutting the thin new seedings to give them a chance.

VEGETABLE PLANTS

VEGETABLE PLANTS— 100 acres this season. Cabbage and Onion plants 500, \$1.00; 1000, \$1.50 prepaid. \$1.00 thousand; 10,000, \$7.50 collect. Prices of Fluid Milk and Evaporated Milk

By LELAND SPENCER

IN THE previous article two figures I were given that New York dairymen should consider rather seriously. It was shown that during the six months May to October of last year the retail price of Grade B milk at stores in New York City was 2.7 cents a quart more than the price for an

Leland Spencer

equivalent quantity of evaporated milk. It was also shown that the largest item in this difference of retail prices was the 1.6 cents more per quart that was paid for fluid milk by New York dealers as compared with the price paid at condenseries in the Middle West.

The question has been raised as to whether these price differences between fresh milk and evaporated milk are typical or normal differences. During the past eight years the difference between retail prices of Grade B milk and evaporated milk at stores in New York City has varied from 0.8 of a cent to 2.8 cents. At present the difference in price is exactly the same as it was between May and October of 1939 (table 1).

The answer as to whether the relation between retail prices of fresh milk and evaporated milk is about the same

TABLE 1. Retail Prices of Grade B Milk and Evaporated Milk at Grocery Stores in New York City.

Year	Grade B (per quart)		Evaporated (per quart of milk equivalent)		Difference
	Cents	Cents	Cents	Cents	
1933	9.1	7.5	1.6		
1934	10.5	7.7	2.8		
1935	11.0	8.2	2.8		
1936	11.0	8.9	2.1		
1937	9.7	8.9	0.8		
1938	9.4	8.3	1.1		
1939	10.1	8.0	2.1		
May 1940	11.0	8.3	2.7		

in New York as in other cities will be found in table 2. During the three years 1937-39 the average difference between retail prices of fresh milk and evaporated milk at stores in 21 cities was 2.9 cents a quart—somewhat more than the difference in New York. The widest spread is found in the South, where fresh milk is high priced and evaporated milk is cheap.

Then, as to the prices paid by dealers for fluid milk and condensery milk, the spread between these two prices from May to October last year was narrower than usual. During the five

years 1935-39 the average price paid by New York dealers for Class 1 milk was 2 cents a quart higher than the mid-western condensery price. During the five years 1925-29 the difference was nearly 2½ cents a quart. Ordinarily the dealers pay a larger premi-

TABLE 2. Retail Prices of Fresh Milk and Evaporated Milk at Stores in Various Cities.

Location	3-YEAR AVERAGE, 1937-39		Difference
	Fresh milk (per quart)	Evaporated milk (per quart of milk equivalent)	
	Cents	Cents	Cents
New York	10.9	8.4	2.5
Buffalo	10.9	8.4	2.5
Rochester	12.4	8.7	3.7
Cities in different sections of United States:			
Northeast	11.9	8.6	3.3
South	13.6	8.3	5.3
North Central	10.9	8.7	2.2
Great Plains	10.5	9.0	1.5
West Coast	10.5	8.2	2.3
21 cities	11.5	8.6	2.9

um for fluid milk (over the condensery price) in the Northeast and in the South than in other sections of the country. During the five years 1935-39 the average prices paid for fluid milk in different sections exceeded the mid-western condensery price as follows:

New England..... 3 cents a quart
Middle Atlantic..... 2½ cents a quart
South Atlantic..... 2½ cents a quart
Other sections (including the Central West and Pacific Coast)..... 1¼-1½ cents a quart

Horse-Sense Applied to Dry Cows

"THE TIME to repair a machine is when it is idle. In a very real sense a dairy cow is a machine, and the time to repair the results of the strain of heavy milk production is when she is dry."

This observation, chuck-full of every-day horse sense, was made recently by a man who has made a life study of dairy cows.

Careful tests have shown without question that attention given to supplying an adequate ration and plenty of it to a dry cow is a sensible and profitable method of increasing her production and the profits from her during the succeeding lactation period. Two facts prevent many dairymen from cashing in on this information. First, there are those who do not recognize the nutrition needs of a dry cow. Second, some dairymen admit those needs, but fail to supply them fully.

A cow that can approach freshening time weighing more than she did when she finished her previous lactation period and in a vigorous, healthy condition because her ration has furnished her with a plentiful supply of nutrients, including minerals and vitamins, is well on the road toward producing a profit for her owner.

Keep Heifers Growing

THIRTY years ago there was some argument among dairymen as to the time when a heifer should freshen for the first time. Many a dairyman argued that heifers should be given another year to mature, and that their first calves should come when they were well along toward three years of age. Because of the considerable expense of raising a heifer, that argument has passed out of the picture. The program these days is to have heifers freshen when they are approximately two years old, but to grow them so well that they are big and thrifty and

A Two Week's Camp Scholarship

ON PAGE 12 of the last issue we announced that a scholarship would be awarded to Camp Miniwanca, Shelby, Michigan. There is still time to make applications, although we should have them right away.

Camp Miniwanca is noted for its leadership training, and the opportunity to attend this Camp for two weeks from August 12 through August 25, with transportation and camp tuition paid by American Agriculturist, is one which should be coveted by every young man.

Applicants must be between the ages of 17 and 21. If you are interested, write immediately to E. R. Eastman, Editor, American Agriculturist, Box 367, Ithaca, N. Y., for full details. The scholarship will be awarded on the basis of achievement on the farm, in school, and in community activities, including organizations of young people.

able to produce heavily with their first calves.

It is easy to say that, but it is more difficult to do it. However, it can be done because it is being done. The requirements, regardless of the exact feeding and management procedure used, are to start with a healthy calf and to keep her growing by liberal feeding with a ration that contains all of the elements she needs.

Probably the most frequent error made in raising heifers is to turn them out to pasture when they are too young. There is no doubt that a heifer calf, born last fall, can get a good part of her feed from good pasture; but for any heifer born since January 1, pasture should be a minor consideration. Even last fall's heifers should not be expected to depend on pasture entirely. They will need some grain, and many dairymen have found that even on the best pastures heifers like to have a little hay on which to chew. What is more important, pastures have a way of drying up and getting short in the summer, and the unfortunate heifer who has to shift for herself will grow slowly and you will be disappointed in her size and producing ability when she freshens.

"Don't look now, but I think we're being followed."

THE LEAGUE STANDS FOR THE AMERICAN WAY

“

Give me Liberty

OR GIVE ME

DEATH!”

cried a

DETERMINED FARMER

and his voice

made All America

FREE

In 1940,

as in 1775

American

Farmers

still believe in the

American Way . . .

Humphrey Ellis, a Dairyman member of Remsen, N. Y., says: “I believe that people who come from other lands to this country to take advantage of the many opportunities offered should support the government and, if they are farmers, the cooperatives.”

Mr. Ellis speaks from experience. Like thousands of others from many countries—men with the love of liberty deep in their blood—he came to America from Wales in 1906. He had heard fabulous tales about the opportunities in America—the economic, political and educational advantages. But like all farmers he was a practical man. He knew that America had been built by farmers—men who had struggled, fought and died to secure and defend its liberties and privileges. “I was willing to work,” he said. And in a few years he was able to buy a farm. He joined the League 13 years ago. “It certainly has been worth the effort . . . bringing up the family on our own acres here in the Steuben Valley,” says Mr. Ellis.

Homestead of the Ellis Farm at Remsen, N. Y.

Patrick Henry was a farmer . . . with the same deep love of liberty that all farmers know. For 10 years he led farm opposition against the taxes imposed by King George III and against the rich Tories in America who owed their great lands and special privileges to the Crown.

In May, 1775, Patrick Henry was one of a hushed and frightened gathering which met in old St. John's church in Richmond. The guns of the battle of Lexington still echoed in everybody's mind. Some demanded war; some advised peace. Washington and Jefferson were there. So were the rich Tories—unwilling to risk their special privileges, unwilling even to listen to the advice of humble farmers. But Patrick Henry, undaunted, leaped to his feet. “We must fight,” he cried. “I know not what course others may take, but as for me, *give me liberty, or give me death!*”

★ ★ ★

A century and a half after Patrick Henry, farmers of the Dairy-men's League raised the same cry. They, too, demanded liberty. They, too, demanded freedom from economic slavery. And they, too, were opposed by rich men who were unwilling to risk unjust privileges and profits in the name of liberty for all.

But because these farmers spoke out boldly in the American Way . . . because they had the strength of numbers and organization . . . and because *with this strength they could not be frightened . . .* Dairy-men's League farmers won their fight. Won the right to live in the peace of their lands without paying tribute to petty kings—the unscrupulous dealers, agitators and their hirelings who try to set themselves up as rulers over the farmer's destiny.

Dairy-men's League farmers won their fight for liberty, because they fought in the American Way . . . because they fought for rights which Patrick Henry was willing to die for . . . rights that Jefferson described in the Declaration of Independence as “life, liberty and the pursuit of happiness.” But chiefly because they fought not as individuals—with spite and hatred and violence—but as members of a great and responsible organization. An organization which speaks the wisdom and restraint of all farmers . . . which stands four-square for the American ideals that have made all men free.

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

BOTH SIDES of the RELIEF PROBLEM

(EDITOR'S NOTE: These letters on the relief question will interest you. Obviously we cannot sign names of writers but they are on file. Again we say we have no criticism of honest, hardworking folks who are on relief because they can't help it.)

MY MOTHER has taken your paper for a long time. I always enjoy reading it too, and there are not many articles I miss. Your article "With Outstretched Hand," by Mrs. Mann, was splendid. She surely hit the nail on the head. May I drive it in?

I was born and have lived my entire life on a farm. I've done all kinds of farm work—building fence, mowing, raking, harrowing, cultivating, and even drawing out the manure in the spring. These are not light tasks for a woman, and it always burns me up to hear the men grumble about the hard work on a farm. Strong, able-bodied men refuse work and allow the taxpayers to support them and their families.

"Why," they say, "should I work from early morning until late at night for so little wages as a farmer pays? Why, relief gives me more than that for the asking."

On the other hand, families, who are desperately in need and who will try to keep themselves up and whose men will strive to find and do some kind of work, are pinched and deprived of the real necessities until they finally give up in despair.

Relief is a wonderful thing IF properly handled. But so much hangs upon that tiny word "if."

Eleven years ago I lost my husband, and a year later became ill myself and have never been able to work since. I struggled along the first few years supporting my son and paying hospital bills until all I had managed to save was gone. At last, try as I might, I was compelled to ask for relief. This, indeed, to me was harder work than following a mule and cultivator. I was humiliated no end. But I had no alternative. I could not work; neither could I support my child and myself on nothing.

At first, the Relief Officer came and questioned me until I was blue in the face from answering questions. He went back to the third and fourth generations. He must know all the family history. Then came the Investigator. When he left, I assure you we had no family secrets. Our souls were laid bare.

They finally decided I could be allowed \$23.00 a month. This I received twice; and then they decided that, because I was ill, I was not eligible for this form of relief. I could have a food check of \$14.00 a month. Did you every try feeding two people, especially a healthy, growing boy, and clothe them on \$14.00 a month? Try it some time. You'll find it more difficult than harrowing in ten acres of oats.

After running myself almost to the point of exhaustion and depriving myself and child of all sorts of essentials, I finally went to a board meeting and proved my eligibility for the first form of relief. When I got back my check, it was cut to \$20.00—but far better than going to the Welfare Officer and being sent thither and yon from one store to another and taking up with all sorts of inferior foods that they could pawn off on you because—well, because you were only another pauper.

But this is the part that hurts. A family of five on relief were getting \$6.50 a week and rent paid. (Yes, I know a few things as well as the Investigator.) The husband finally got a job at \$4.00 a day, and an older member of the family worked, bringing

\$5.00 more a week. Relief went right on, mind you. Finally a shipment of various commodities were sent the Relief Officer for distribution, and when handed out in the amount quoted for this particular family, the wife was highly indignant over the small quantity she received!

Oh, yes! Relief is wonderful—for some. But there is no more fairness or justice about it than there is any of the rest of the politics we have these days (unless it's in Vermont).

Recently I received notice that a reduction must be made in my allowance. You know they are trying to cut down on relief, and like a sinking vessel, it's "women and children first."

Of course, you wouldn't print this. You wouldn't dare. The whole relief force would bang your door down and explain how extremely efficient it is. No doubt it would be said that I shouldn't be biting the hand that feeds me. I'm not biting—I'm just growling. Perhaps my bark is worse than my bite.

To say the least, relief is the foulest politics we have; and the country will be no better until it is properly handled, and that word "properly" carries a big meaning.

Yours for a fair and honest relief to those who really need it.

From a Welfare Officer

AS A TOWN Welfare Officer for one and one-half years, I heartily believe, and did at the time I took office, that the only way of ever changing conditions is to handle as many relief cases as possible locally.

Take, for instance, the matter of investigation. In some counties this is done by a Social Service Worker from the county or city office. With all due consideration for their education and ability, they cannot sort out the "needy poor" from the "squatters" nearly as well as a person who knows local conditions and people. I do my own investigating, write up my case histories, and check on some every month or week.

Mrs. Mann speaks of a wood lot.

Last year our Town Superintendent of Highways brought trees in sections to a vacant lot in the village. These were cut from a portion of cleared road. I established this ruling:

A man at work, who receives some relief, such as medical, could go to the wood lot and cut himself a cord of wood in odd times as he needed it. The men out of work must cut wood every day that the weather was suitable and must cut two cords, one for himself and one for the town to be used in families of widows, etc.

This has worked out splendidly. Fifty cords of wood have been cut and delivered this past winter. At \$2.00 a cord, this saved the town \$100.00, and the wood was handy when the snows made roads impassable. The taxpayers felt better to see the men at work, and the men were kept in better health.

Another project which justified itself was a Garden Contest, held last summer. All families who asked for relief during the winter must have a garden. The Home Bureau cooperated, and their committee judged the gardens. Money prizes were given out. The Home Economic and Agriculture teachers from the High School helped in many ways. The mothers and daughters canned the garden surplus, and townspeople gave cans. It is surprising how criticism and prejudice vanish in a community working together for a common cause.

In studying the Welfare Law, I found that welfare bills are collectable for a period of ten years. At first this seemed an unheard of practice, but by taking the matter up in the local newspaper and elsewhere as cases came up, I have handed over to the Town Board, in the one and one-half years, nearly \$500.00 in cash. I make the conditions as convenient as possible, and some pay \$5.00 a month back to the Town when they can. One man this month gave forty cords of wood in return for medicine given his wife and children.

I find many cases where the relief families are not so much poorer than others, but seem to need help and understanding in planning to meet their needs. Sometimes advice is more needed

ed than a food order, and encouragement and faith go a good way. Of course, I do have some cases who need a good stiff lecture every week. I have never asked any family to work any harder than I do.

Criticism is so easy, and the trouble to look up conditions takes time. So many people judge without knowing the facts. However, Social Service Workers learn that to carry on an honest administration, one must expect all sorts of criticism and have enough faith in himself or herself and in the community to carry on in spite of odds.

Would it not be worth while to have a forum in some paper where Town Welfare Officers and others could tell of their experiences and discuss topics of interest to all? Much might come out of it.

* * *

He Wants Work Not Relief

IT WAS my privilege to read the account "With Outstretched Hand" by Mrs. Eda Mann. I am realizing some of that very thing. I tried my level best to keep off relief, but the ultimate end was W.P.A. I left my family here in October, 1938, so that I might keep off the system. I returned here about a year ago to take my family to New York State; but the man was in a hurry, and I could not get to his farm in time owing to unforeseen circumstances.

The article spoke of farmers wanting help but not being able to get it. Some think this relief system is easy money, still I would rather work on a farm at hard labor than to have to put up with it. I have had some experience around a dairy farm. My knowledge of planting, etc., is limited; but I am willing to learn.

I am a native of New York, and know something of the state, having traveled considerably through it in the past. I am a young man of thirty-five with a wife and two small children. Our home is a Christian one—that is, my wife and I are what scripture terms call "born again" Christians. Our church relations are with the Wesleyan Methodist Church. I don't use tobacco or intoxicating liquors in any of their deadly forms.

If there is any possibility of getting any dairy farm work in the good old Empire State, I would certainly appreciate it. I can thank God that I still have some initiative and backbone to want an honest, independent living apart from our government. I realize that it is abused, and some never try to get anything else.

(If anyone is interested write American Agriculturist editor.)

Woodsman, Mark That Tree

By J. A. COPE,

Extension Professor of Forestry, Cornell University.

FARMERS of Tioga County, New York, are beginning to realize that the farm woodlot is really a farm crop, and that if properly handled it may bring in considerable income. So about a year ago some of these farmers organized themselves into the Tioga Woodland Owners Cooperative, and incorporated under the cooperative law of the State of New York.

This organization is a non-stock cooperative, and any woodland owner living in southwestern Tioga County is entitled to join by paying a lifetime fee of \$1 and signing the marketing agreement. This agreement is the essential safeguard to the whole enterprise. The cooperative acts as a Bargaining Agency for its members, and through this Bargaining Agency secures better prices than members could get for their timber as individuals. If it were not for the marketing agreement, with the specific provision that trees to be sold must be marked by the cooperative's trained tree marker, then the whole purpose of the cooperative would be defeated, for better prices would otherwise mean a quicker destruction of the

whole woodland. The marker controls the cutting and the farmer practices forestry in spite of himself.

The Bible admonishes mankind to "seek first the Kingdom of Heaven and all things else will be added." This cooperative effort of farmers in Tioga County provides a parallel in the secular field. Having sought first the control of cutting by marking as the surest way to get forestry practiced, it has been possible to secure a land map and inventory of 23,000 acres of farm woodlands lying in one section of Tioga County, through the generous cooperation of the Federal government as represented by the Forest Service and the Soil Conservation. It has been possible to persuade the largest buyer of logs from the cooperative to use the Scribner Log Rule instead of the customary Doyle Rule, thereby increasing price returns to the owner from the logs sold sufficiently to pay the timber marker's fee. This woodland cooperative also has been able to make a contract with a buyer of pulpwood for several thousand cords of wood for

Good Books to Read

The Customer is Always Right,

Anne Pence Davis.

A good title for the story of a large department store in a Texas oil town, containing everything from a bargain basement to a fashionable French Room. To work at Stacy's gave one prestige. The characters are well drawn, but it is the day-to-day working of the store itself, the technique of the girls with customers, minor triumphs of the window dressers, and the problems of the advertising department, that make reader interest. The Macmillan Company, New York. \$2.50.

Good Movies to See

IT'S A DATE. Loveliest of all the Deanna Durbin pictures.

OUR TOWN. Screen version of Thornton Wilder's Pulitzer Prize play. Simple and touching portrayal of American life.

NEW MOON. Jeanette MacDonald and Nelson Eddy return in a new screening of the stage success.

NEW ENGLAND

— Land of Farms

(Continued from Page 1)

superiority, consider the startling fact that New England farm income is 50 per cent greater than that of North and South Dakota combined, while each of these states in itself is larger.

Consider the matter of amount of capital invested. As compared with the far-flung extent of western farming you might think that the capital layout in New England farms would look mighty small. But such is not the case.

Here again New England ranks well up in the list. The value of farm land and buildings in New England foots up to the surprising total of more than 900 million dollars.

Turn now to some special branches of agriculture. How do they stack up in comparison with other farm sections?

Well, there is dairying. Both in respect to value of the milk at the farm and in respect to cash income there

Value of New England's spuds is five times greater than that of Virginia, Ohio, Wisconsin or California.

Perhaps it's unfair to brag about some of our special crops, but other states do, so why shouldn't we? Give New England credit for her leadership in cranberry production. Two-thirds of all the cranberries in the United States are grown in Yankee land.

In maple syrup and sugar production New England is easily the leader. Production of maple products in New England is more than twice as great as in any other state in U. S. Only state of any importance outside New England is New York, while Ohio, Michigan and the like trail far in the rear.

Much more could also be said about the greater stability and permanence of agriculture in New England, as compared with many western and southern sections. New England has no farm migration problem. In New England, farming is not only a business, but also a mode of living. New England farms provide relatively greater security to family life than do farms in most other parts of the country.

It has been truly said, "Of their own merits, modest men are dumb." Modesty has long been recognized as an outstanding characteristic of Yankee folk. An admirable virtue, indeed, and we do not think that in telling this story of New England agriculture we are making any radical departure from this traditional modesty. We are merely stating facts.

We believe it strongly advisable that the public realize how extensive our farming industry is. We believe that New England agriculture should receive greater recognition.

There is a twofold need of this wider recognition. First, it is highly important that the true place of New England agriculture be fully understood within our own borders, so that our agriculture may receive its fair share of attention when comparisons are made between agriculture and industry. Secondly, it is equally important that the true place of New England agriculture be fully understood outside our own borders, so that New England be given its rightful recognition when comparisons are made between agriculture of this section and the agriculture of other areas.

Agriculture is a real business in this northeastern corner of the United States. New England need take its hat off to no one. New England, the oldest settled region of our great country, continues to keep its place as a leading source of food supply for its large population.

Late Blooming

By Julia Lounsbery Wallace.

An apple tree I thought was dead
This spring has flung about her head
A scarf of petals, fold on fold —
So beauty stays, though we grow old.

are only three states in the U. S. (Wisconsin, New York, Pennsylvania) that rank higher than New England. Milk income is 50 per cent more than Ohio, Illinois, or Michigan. It is four times as much as Nebraska and New Jersey.

Many people under-estimate the importance of New England in the poultry industry. But here once more the figures tell the story. The records show there are only 6 states in U. S. that take in more money from sales of eggs than New England.

Income to Yankee farmers from eggs is more than that of most of the so-called leading poultry states in central part of U. S. New England is well out in front of Illinois, Wisconsin, Indiana, Nebraska, and the like, and is not far behind Ohio and Pennsylvania.

That is not the whole picture either, because New Englanders excel not only in their volume of sales but also in the rate of production. Egg output per bird is higher in New England than anywhere else in the country. Massachusetts with yearly average output per bird of 123 eggs, followed by New Hampshire with 108 and other Yankee states close in line, compares with average production in Middle West of approximately 70 eggs per bird.

The apple business of this country originated in New England, and if you are under the mistaken impression that we are slipping look at these facts: Only four states, (Wisconsin, New York, Pennsylvania and Virginia) take in more money from apples than does New England. Income to Yankee farmers from apple sales is 2½ times larger than that of much touted Oregon. It is 40 per cent larger than that of California, and is well ahead of that of important fruit producers such as Michigan, Ohio, and West Virginia.

In the potato business New England easily leads the field. Sales of Yankee spuds bring an annual income that is nearly twice as large as any other state, and over-top some of the supposedly important states by staggering amounts. For instance, Idaho gets plenty of ballyhoo, but New England sells three dollars worth of potatoes for every dollar's worth of Idaho's.

"We better take this hill in reverse, Casey. They're slidin' out!"

With AMERICAN AGRICULTURIST Advertisers

STUDENTS TOUR CITY MARKETS.—During Easter vacation 42 students of marketing in the New York State College of Agriculture went to New York City. For five days they studied food distribution in the metropolitan area. In the picture we see two of the students studying egg packaging in the A & P Bronx Warehouse. In the picture, from left to right, are: Betty Baner, Warwick, N. Y.; A. Joslin of the Atlantic & Pacific Company; Hazel Tharp, Rhame, N. Dakota; and Professor Alfred Van Wagenen of the State College of Agriculture.

Jobs for Farm Boys

AN UNUSUAL opportunity for young men, between the ages of 18 and 25, living on farms is offered by the National Farm Youth Foundation, sponsored by the Ferguson-Sherman Manufacturing Corp., in cooperation with Henry Ford and Edsel Ford of the Ford Motor Company.

The plan of the National Farm Youth Foundation is unique in that it gives, without cost, actual training to young men on farms and provides the opportunity for those who make best use of this training to get paid jobs. The training, which costs you nothing, is a six months' correspondence course in farm engineering and management, prepared by the LaSalle Extension University. If you were buying this course of training in this well-known school, it would cost you \$136.00.

But that isn't all. Every applicant who is accepted will also be given individual training in tractor operation and management, as well as some practical experience in demonstration and sales work.

Every young man who takes this training will have an opportunity to secure a job. Twenty-nine jobs with the Ferguson-Sherman Company are being offered with a one-year contract at \$150 a month, and 29 jobs with Ferguson-Sherman distributors with a one-year contract at \$125 a month. In addition the names of 725 young men will be put on an honor roll list to be given additional jobs as openings develop.

There is another angle to this program for giving training to young men on farms. Twenty-nine who take the course and who win a tractor operation competition to be held in each distributor's territory will receive Ford tractors, equipped with a two-bottom 14 inch plow.

At Chicago the other day, when this important plan was announced to a group of farm paper editors, R. N. Kyes, Director of the Foundation, said they would like to get the applications in as soon as possible. Therefore, we urge that you consider this matter carefully and make your application at once. You can either see your local dealer who sells Ford tractors or you can write the National Farm Youth Foundation, Box 329, Dearborn, Michigan.

All the requirements you need are that you be between the ages of 18 and 25, an American citizen of good character, and actually living on a farm. You assume no obligations except the conscientious intention of carrying on the study and completing the six-month course.

The National Farm Youth Foundation estimates that 20,000 young men on farms

will be enrolled in this course. Considering the wonderful opportunities offered, we will be much surprised if the number does not far exceed this.

The National Farm Youth Foundation has been formed by the Ferguson-Sherman Manufacturing Corp. and Ford Motor Company as an expression of their faith in the land and in the coming generation of young men on farms. It is their belief that it is unfair to ask young men what experience they have had without giving them the opportunity to gain that experience. The opportunity they are so freely giving is one that can be grasped by any farm boy between the ages of 18 and 25.

* * *

TO ENCOURAGE SAFE DRIVING

THE FORD MOTOR COMPANY, through the Ford Good Drivers League, is taking steps to put a premium on safe driving. In a national contest prizes will consist of 48 university scholarships and other awards to the total value of \$30,000. Eligible to participate are all boys in the United States between 14 and 18 years of age who are qualified and legally authorized to drive a car in their home states.

To enroll a boy will be required to fill out, sign, and mail to the League offices in Detroit an official enrollment blank. This blank can be obtained from any Ford dealer. No fees are required. Contestants must make an actual driving test of at least 25 miles in any make of car accompanied and scored by an adult observer. State winners will then be chosen and will go, all expenses paid, to the New York World's Fair. There they will participate in a national contest based on actual driving skill under the supervision of competent judges. The national finals will be held the week of August 25; so get your application blanks now, boys, and work for one of these scholarships.

* * *

HEALTHY TURKEYS

If you grow turkeys, you will be interested in the booklet "Dr. Salisbury's Turkey Talks on Health and Disease," published by DR. SALISBURY'S LABORATORIES, Charles City, Iowa. Disease control is the biggest step forward in turkey raising in recent years; but disease is still a problem, and every grower wants full information about troubles that may cause him losses.

A similar booklet, aimed at troubles of chicks, is "Dr. Salisbury's First Aid to Poultry." Either book will be sent without cost on request, or you can get them from your local dealer handling Salisbury products.

No "Grade A" Milk After September 1st

AT A MEETING of the New York City Board of Health on May 14 an amendment to the Sanitary Code for Milk was adopted definitely providing for one grade of milk to be delivered in the city after September 1. The designations "Grade A" and "Grade B" have been dropped entirely, and the single grade of milk will be known as "Approved Milk."

Dairymen first learned about such a move when the New York City Board of Health made a tentative proposal along those lines on last January 9. Since that time there has been a lot of discussion which so far as dairymen are concerned has been pretty nearly 100 per cent in opposition. Producers of Grade A milk advance two arguments that are hard to refute. The first one is that at the requirement of the City Department of Health, they had spent a lot of money putting their barns in condition to produce Grade A milk, and failure to receive the customary Grade A premium would work distinct hardships on them. The second argument was that many consumers want a milk better than average and are willing to pay a premium for it.

In recent years approximately 5,000 New York State dairymen have been producing Grade A milk for about 60 Grade A plants. To this group of dairymen Grade A premiums have returned an additional income of approximately \$2,000,000 a year. This is a serious loss to the dairymen involved, as well as to the industry. It is to be hoped that the dairy industry can, under the arbitrary provisions of the New York City Board of Health, work out some plan whereby a premium grade of milk can be offered to consumers, thus preventing at least a part of this loss to dairymen.

Grade B producers saw an attempt to "jack up" the already rigid requirements under which their milk was produced, thus adding to their costs, apparently without any intention on the part of the city of paying more money for it.

Notice was served on the Department of Health in no uncertain terms by representatives of the dairy industry that if the health requirements for producing milk were to be stiffened, dairymen would have to have more money to cover extra costs.

Requirements of "Approved Milk"

Here in a nutshell are the main provisions of the action taken by the City Department of Health on May 14:

After September 1, only one grade of milk—Approved Milk—will be permitted.

The bacterial count of this Approved Milk as delivered to consumers is not to exceed 30,000 per cu. centimeter. Here is where part of the stiffer requirements come in. That 30,000 per C. C. is the present requirement for Grade A, as compared to 50,000 for Grade B. It will cost producers money to meet that requirement.

The butterfat of Approved Milk is to be not less than 3.3 per cent. There has been some talk that this figure would be 3.5. Milk must contain total solids of not less than 11.5 per cent.

Milk must be sold to the consumers within 48 hours after it is pasteurized.

A new type of cap for bottles will be required. The new cap must completely cover the pouring lip of the bottle. This again is a step toward the former requirements for Grade A milk.

The top of the bottle cap is to be used for printing the required information as to contents, and no trade name is to be allowed on the cap. Partial provision is made for the sale of milk with a distinctly higher butterfat content than is required for Approved Milk. Such milk, testing at least 4.2 per cent of butterfat, can carry a state-

ment to that effect somewhere on the bottle or container other than on the cap. So far as we can see from this information, the bottle or container could also carry a trade name so long as it doesn't appear on the cap. Therefore, the road is at least partially open for the production, advertising, and sale of premium grades of milk at the discretion of dealers and providing it contains at least 4.2 per cent butterfat.

New York City Health Commissioner Rice is quoted as saying, "I can assure the public that all milk that meets these new requirements can be confidently used. I can see no reason why these new requirements should increase the price of milk to consumers."

Time may prove that Commissioner Rice is right so far as the retail price of milk in New York City is concerned, but dairymen know too well that it is going to cost them more money to meet these additional requirements. If consumers don't pay more, the dairymen will take the rap, and if we know dairymen, they are not going to do it willingly. This situation is just one more bit of evidence pointing to the necessity for a strong, unified organization of milk producers.

April Milk Price

Administrator Harmon has announced the uniform price to producers shipping to the metropolitan market as \$1.81 for milk testing 3.5% butterfat in the 200 mile zone for the month of April. This is 11c less than the March price, but is way above the April price a year ago. At that time the Marketing Order was not in effect, and the price to producers in the 200 mile zone ranged between \$1.00 and \$1.18.

A decline in the milk price at this time of year is expected. There are two principal reasons for the decline this year—the usual one of seasonal increase in milk production, and a seasonal decline in the price of products into which surplus milk is manufactured.

The April uniform price of \$1.81 per hundredweight is based on Class I or fluid milk at \$2.82; Class II-A or fluid

NOMINATE A MASTER FARMER

THERE is still time to make nominations for Master Farmers. All that is necessary is to write a letter to H. L. Cosline, *American Agriculturist*, Box 367, Ithaca, N. Y., giving the name and address of the man you wish to be considered. However, any general information you care to give us about his farm and community activities will be appreciated. Before you make nominations, consider these facts:

1. Few men are named as Master Farmers until they are at least fifty years old.
2. Master Farmers must be reasonably successful in a financial way, although that is only one basis on which selections are made.
3. Master Farmers are not named for farming excellence alone. Equal importance is given to their home lives, as well as to the contributions they have made to agriculture and to their communities.

The fact that the man you nominate may not be chosen this year has no effect on his eligibility. He can be nominated again at any time. In fact, in recent years most of the men who have received this honor have been nominated several times over a period of years.

cream at \$1.90; and the following prices per hundred for the other seven classes representing the value of milk used for manufacturing: Class II-B, \$1.763; Class III-A, \$1.363; Class III-B, \$1.504; Class III-C, \$1.104; Class III-D, \$1.079; Class IV-A, \$1.004; and Class IV-B, \$1.035.

Deliveries of milk by producers shipping to New York in April were 12.3% higher than for the month of March.

Milk Dealers Must Be Licensed

Commissioner Noyes reports that up to Friday, May 10, applications for licenses have been received from 4,694 milk dealers. Last year on the same date there were 4,250 applications. Milk dealers actually licensed on May 10 totaled 4,125, as compared to 3,780 a year ago.

Commissioner Noyes considers the situation favorable, but adds that the Department will continue its efforts to obtain full compliance with the law requiring licenses and bonds from all milk dealers.

Horseshoe Pitching

For sixteen years the Farm Bureaus of New York State, *American Agriculturist*, and the New York State Fair have cooperated in staging a statewide Horseshoe Pitching Tournament at the State Fair. The dates of this Tournament this year will be August 27 and 28.

Responsibility for the county contests is held by County Farm Bureau Managers of each county; and the winners

at those contests, or the alternates, in case the winners are unable to attend, are eligible to compete at Syracuse. Last year about 35 counties sent contestants, and at least an equal number is expected this year. If your county was not represented in 1939, we have no doubt that the County Farm Bureau Agent will be glad to arrange for a contest if there is sufficient interest in the county.

The winner at the State Fair gets a gold medal and a \$50 cash prize. There are six other cash prizes, running from \$40 down to \$5. The State Fair also pays transportation charges to and from the Fair.

Potato Field Day August 8

August 8 is the date for the 11th Annual Potato Field Day. The place is the 287-acre farm of Gilbert Prole near Batavia, Genesee County, New York.

On that date 70 acres of potatoes will be growing on the Prole farm. There will be ample space for parking cars, exhibits, and machinery demonstrations. Last year on the Gardner Farm at Tully, Cortland County, New York, attendance was estimated at 13,000, and there is every reason to believe that there will be at least that many persons attending this year.

For those who arrive in the afternoon of August 7, a tour has been arranged to the Elba muck area, where potato digging will already be under way. The General Chairman for the day will be Ralph Morgan, County Agricultural Agent of Genesee County. Nine committees have been appointed to aid him in the various activities of the day.

Historical Pageant at State Fair

This year marks the 100th anniversary of the New York State Fair. One of the big features being planned for the entertainment of spectators is a historical pageant to be presented the first five days of the Fair, August 25 to 29. It will be given on a 600-ft. stage the full length of the grandstand, and it is estimated that at least 1500 people will take part in it.

Information and incidents on which to base the pageant are being requested from historical societies and other sources of information, and finally the pageant will be worked into a running story, depicting New York history from the days of the early Indians to the present time.

Army Maneuvers in Northern New York

Northern New York will be the scene this coming summer of extensive Army maneuvers in an area covering three counties. Trespass rights are being secured from farmers in those counties. Major T. F. MacCarthy has reported that these trespass rights have been secured for 70 per cent of the entire area to be covered by the maneuvers.

There is no question but that these Army maneuvers will bring an appreciable amount of money into the north country this summer.

Aberdeen-Angus Sale at Ithaca Averages \$298

MAY 13 was the date of the Fourth Annual Sale of Aberdeen Angus cattle at the Judging Pavilion of the New York State College of Agriculture at Ithaca. The sale is sponsored by the Eastern States Aberdeen-Angus Breeders' Association, of which John Lathrop of Laurel Hill Farm, Blandford, Mass., is President; and R. B. Hinman of the New York State College of Agriculture, Secretary.

Starting at 9:30 in the morning there was a show, judged by Professor William Skelley of the New Jersey Experiment Station, of all of the animals in the sale. As judged by Professor Skelley, Grand Champion Bull was awarded to Erica Cornell's Last No. 542504, an entry of the New York State College of Agriculture. This bull, as well as his sire and dam, was bred at the University Farm. At the sale in the afternoon he was purchased by Andelot Stock Farm, Worton, Maryland, for \$430.

The Grand Champion Female, Lady Pride of Good Hope, No. 553290, was exhibited by Good Hope Farm of Old Chatham, N. Y., and at the sale in the afternoon was purchased by Hideaway Farm, Far Hills, N. J., for \$600.

First places in various classes at the show were widely distributed, and in only one instance were two first prizes

won by the same farm. In addition to the selection of the champion bull and champion female, there were seven classes in the judging. The two bull classes included those calved before January 1, 1939, and those calved after January 1, 1939. The five classes of females were divided into five age groups.

Colonel Arthur Thompson of Lincoln, Nebraska, was auctioneer for the afternoon sale. Fifty-three animals were sold at an average price of \$298. Three animals consigned by the State College of Agriculture brought an average of \$380—the highest average for any single consignor. All three animals were bred by the University.

The cattle sold at the sale were selected by a committee appointed by President Lathrop, and selections were all made prior to December 15, 1939. All were from herds accredited as free of bovine TB and were from approved abortion-free herds. Four animals were consigned from Massachusetts, two from New Jersey, and the balance from New York State.

A crowd of approximately 400 attended the show and sale. The whole affair moved off in a smooth, efficient manner. This, of course, was due to the officers of the Association, and particularly, we expect, to the efforts of Secretary Hinman.

The Market Barometer

Potato Situation in the Northeast

Many potato growers have been surprised to find that the prices of local potatoes have not shown any activity during the last month and might be interested in an expression of why that condition existed.

Although the south experienced some severe weather, the damage to the potato crop was not very heavy except in one section. In that section they harvested a lot of small potatoes which of course had a bad effect on the price and since there is a direct relation between the price of old potatoes and the price new potatoes are bringing this has a bearing on the picture.

The worst effect of the cold weather and freeze was to delay the growth and maturity of the crop. As a result potatoes are from three to four weeks late in the south and conditions indicate that they will be two to three weeks late during the rest of what we call the early potato crop season.

The western coast, however, presents a different picture. During the last few weeks Kern County, California, has developed an extensive potato district which this year matured its crop about three weeks early. Many of our eastern markets have this year seen the so-called California Long White potato exhibited prominently in our retail stores. They fill the market at a time when Florida potatoes were scarce. Now that Florida has plenty of potatoes they find their potential outlets, which were good markets in the past, filled and well sold on the California Long White. As a result they have had to sell at less money to find a home. This competition between the south and California has caused low prices for new potatoes and of course old potatoes have reflected the situation.

Old potatoes will probably find a ready market for another week or so when there will be ample quantities of new potatoes moving in to take the place of the old potato which is beginning to show some withering and sprouting.

When you go to market next time notice these washed, Long White California potatoes and you will see why the retail grocer has found they sell so readily. It is pretty good proof that the consuming public buys potatoes on appearance as well as a lot of other vegetables and fruits. If you should happen to take some home to cook you certainly will agree that they are not selling on account of their cooking quality.—H. J. Evans.

May Crop Report

WEATHER—The New York State Department of Agriculture and Markets reports average April temperature as 3 degrees below normal, and rainfall during the month as 1 inch above normal. On May 13, the date of the report, it appeared that the soil in the state had become so saturated with moisture that the water supply seemed adequate at that time.

WINTER WHEAT—Very little winter wheat acreage in New York State was lost from winter killing. In general the crop looks good, and the indicated production will be about 5,985,000 bushels, compared to 6,274,000 last year.

In the southern great plain areas and in the west the acreage abandonment has been heavy, and as a result the U. S. estimate of the winter wheat crop is 459,691,000 bushels, as compared with 563,431,000 harvested last year

and a 10-year average of 571,067,000 bushels.

A year ago stocks of wheat on April 1 totaled 278,554,000 bushels which, with the exception of April 1, 1933, was the highest on record. This year April 1 stocks were 238,301,000 bushels.

PASTURES—On May 1 the condition of pastures in New York was given as 71 per cent of normal, as compared to 79 per cent of normal a year ago. However, the season has been so late that it was difficult to determine the condition of pastures and also of meadows. Due to a shortage of hay in some areas, cows were turned out rather early, but pastures since May 1 have improved rapidly. On May 1 farmers were reported as having 275,000 tons of hay on hand, which was less than 1/2 of last year's holdings of 660,000 tons on the same date.

MILK—Milk production for New York State for the month of April was estimated as 6 per cent higher than a year ago. On May 1 production per cow was highest and the fewest cows were dry of any year in the 15 years in which records have been kept. The amount of grain fed per cow and per 100 lbs. of milk was the highest since 1932.

For the entire country milk production was at the near-record level of May 1, 1938 and 1939.

FRUIT—In some areas peaches suffered some winter killing of buds, and bush fruits were broken down by heavy snow. With these exceptions, New York State fruit came through the winter with about the normal amount of winter injury. Considerable damage was reported from mice and rabbits which not only girdled some trees, but chewed bark off branches, deep snows giving them that opportunity. Blossoming of fruit was generally late in New York State.

Winter weather did a lot of damage to peaches in some of the central and southern states. As a result, the peach crop for the entire country is expected to be about 25 per cent below average. Supplies of oranges and grapefruit available for marketing during the late spring and early summer will be smaller than last year.

MAPLE SUGAR—Although the maple sugar season in New York was the latest in the 14 years records have been kept, it was about average length, and the crop was approximately the same as a year ago.

STRAWBERRIES—The States of Delaware, Maryland and New Jersey show considerable increases in crops of strawberries. Expected crop in nine intermediate states, including those three, is 3,377,000 crates, compared to 3,063,000 a year ago, and 2,751,000 for the 10-year average. In late strawberry states, where estimates are not yet available, 60,300 acres are available for harvest, as compared to 55,900 acres a year ago.

CABBAGE—The estimated acreage of cabbage in intermediate states, which come into production about the same time as Long Island and New Jersey, is 36,700 compared to 35,490 last year. The Long Island acreage, which is included in the previous figure, is 2,400 compared to 2,300 last year.

In late cabbage states, growers reported intentions to plant 74,950 acres, compared to 71,800 a year ago and a 10-year average of 77,420.

POULTRY—From January 1 last, the chicken population of New York State farms was 14,830,000 which was 6 per cent greater than January 1, 1939, and 7 per cent more than the 10-year aver-

age. For the entire U. S. the chicken population was 4 per cent above a year ago and less than 1 per cent above average.

It appears that hatchings of baby chicks during April were only 1 per cent lower than a year ago, giving some support to the idea previously expressed that the decrease in the number of baby chicks hatched for the entire season would not be as low as early figures indicated. March hatchings were about 11 per cent less than a year ago, while advance orders for delivery during May or later were 14 per cent below a year ago.

Livestock on New York Farms

The number of horses and mules in the United States decreased 2 per cent between January 1, 1939, and January 1, 1940. This downward trend has been fairly steady for the past twenty years.

In New York State during 1939, the number of mules and mule colts remained stationary at 5,000. In fact, there has been no decrease in the number of mules on New York farms since 1934. Last year there were 309,000 horses and colts, and the year previous 312,000. From the figures available, it appears that 1913 saw the biggest horse population in the state in recent years, when there were 594,000.

At the same time, the number of tractors on New York State farms has been steadily increasing. In 1925 New York had 25,681 tractors; in 1930 there were 40,369; and in 1934 tractors had increased to 63,046.

Sheep—For some years there has been a definite trend toward fewer sheep in New York State. On January 1, 1940, the number of sheep and lambs in the state was given as 332,000. Ten years ago the number was 470,000; twenty years ago, 549,000; and thirty years ago 667,000. Whether or not this downward trend will continue is a big question. There is a definite belief on the part of many sheep men that there is much hill land in the state that could be readily adapted to sheep raising. Report of an extensive experiment to determine the facts of this matter was made on page 3 of the April 27 issue.

Hogs—New York State's hog population on January 1, 1940, was 259,000. There has been an up-turn in hog numbers for the past three years. The numbers for 1939 were 251,000, and for 1938, 230,000. Previous to 1938 there were a number of ups and downs, but from 1918 on there was a steady decrease. On January 1, 1918, we had 731,000 hogs in this state.

State Dairymen Among Leaders

New York state dairymen continue among the nation's leaders in the work of herd improvement, testing and keeping records on their herds, says G. W. Tailby of the state college of agriculture. The number of dairy herd improvement associations in the country on January 1 was 13,000, an increase of 72 during 1939. During the same period the number of enrolled herds increased by 2000 and the number of cows on test by 50,000.

New York is next to Wisconsin in the number of associations and in the number of herds on test, the report shows. Wisconsin has 160 associations and New York has 134. New York is second to California in the number of cows on test. The Pacific coast state has 90,021 cows on test and New York has 74,162 cows on test.

The Empire state has 5.2 per cent of its dairy cows on test as compared with 2.7 per cent on test in the entire United States.

Setting Out Hardwood Trees

The Forestry Department of the State College of Agriculture at Cornell has been experimenting with plantings of hardwood forest trees. In the past five years 34 plantations of about an acre each have been established in 33 counties. It is hoped to find methods which will permit wide-spread plantings of abandoned land to hardwood trees.

From 1935 to 1938, 27,000 trees were planted and 80 per cent of them sur-

vived the first growing season. Plantings which have been made include: Red Oaks, White Ash, Sugar Maples, Black Cherries, Yellow Poplars, and Basswood.

Eleven Million Young Trees

During the month of May the New York State Conservation Department is setting out about 11,000,000 young trees. With the exception of a few trees supplied by the Soil Conservation Service and a few raised by a CCC camp in Allegany County, the trees were all raised in the State's forest tree nurseries at Saratoga and Lowville.

The actual planting is being carried out with the help of 19 CCC Camps. It is expected that this spring's program will result in the reforestation of about 15,000 acres, and will bring the total reforested acreage in the state up to 316,500.

Bee Inspection

As provided by the state law, the Department of Agriculture and Markets makes a yearly inspection of bees about this time of year. Thirty inspectors under the direction of the Bureau of Plant Industry will do the work. One crew will work in the Hudson Valley, another in the eastern Mohawk Valley, one will be assigned to central New York, and two to the western part of the state.

This inspection is done to detect disease, and any colonies which are diseased must be destroyed.

Northeast Markets for Northeast Producers

DAIRY CATTLE

"Invincible"

Sons of Carnation Inka Invincible, our son of Sir Inka May, who now joins ranks of 1000 lb. fat sires.

By J. F. (DOC.) ROBERTS

COWS THAT have been T.B. tested or Bang's tested, even when marked, are not selling at a discount from other cows sold for meat purposes on our public markets. This point should now be cleared up in a good many minds, for you should not continue to be receiving less for these animals, which are fit for food. There is, nevertheless, a justifiable reason why so many still feel that a price differential should continue to be taken. For a number of years, during the first T.B. testing, a good many reactor cows were condemned by government inspectors because they really were unfit for food, but this was always after the packer had bought them, and so he had to buy at a discount to offset this almost complete loss on a cow that was condemned. The situation is entirely different today; condemnations on second or third tests, or on Bang's cows, are not any greater than on any other cows, and the price, therefore, is NOT DIFFERENT, and it is not justifiable for any cow buyer to try to make a price

differential. Incidentally, butcher cows of all classes continue in active demand at all markets.

* * *

It is not advisable to turn out to grass any livestock that has been on dry feed all winter, if you plan to market it shortly. In the first place, grass cows will not kill as well for the packer, and therefore he cannot be expected to give as much. In the second place, any livestock will shrink in weight when first turned on grass, or until it has become well accustomed to a grass diet again. Please do not confuse this with a long-term pasture program, as it applies only to stock which you plan to market for meat soon.

* * *

Old or barren ewes and yearlings, which are in good flesh, should be marketed at once. They are bringing good money now, but always break as warm or hot weather arrives and the public has no appetite for heavy mutton. Then soon now, the lamb men in the South will be weaning their lambs and culling out and marketing a world of old ewes. Right now is also the time to see that your lambs do not get a set-back when you turn the ewes out. Keep your lambs "coming" through this period, and they will continue to gain until ready for market. Grain both lambs and ewes, if necessary, in order to do this.

* * *

My hog predictions of a couple of weeks ago went "bloody". Yet hog receipts have fallen off. Supplies of pork in this country were, and are, lighter than a year ago. England gets 30 or 40% of its supply from the Scandinavian countries, which had apparently been cut off. But in spite of all this, the hog market broke again. Just why, or what it's all about, no one seems to know. Maybe we had better send a couple of our good, honest farmers, without "contacts", over there and find out. Politicians seem to have the "contacts", but get most unusual answers to say the least.

Success With Calfhood Vaccination

DELAWARE County, New York, Farm and Home Bureau News publishes another interesting experience of a dairyman in controlling Bang's Disease by calfhood vaccination.

The dairy is owned by William J. Storie of Bovina Center. When the experiment was started in 1936, the herd consisted of 45 Jerseys. The blood test showed 5 animals or 11 per cent to be positive. Mr. Storie had had much trouble with abortion in preceding years.

During the fall and winter of 1936 and 1937 all the calves about the ages of five to eight months were vaccinated. The evidence so far in this herd is very favorable to calf vaccination for Bang's Disease.

Vaccination for Bang's Disease is still in the experimental stage, but so far scientists are agreed that the following principles should be observed:

1. Calves should be vaccinated between the ages of 5 and 8 months.
2. Only one kind of vaccine is used. It is called "Strain 29."
3. Only a competent veterinarian should do the job.

The "Hidden Name" Game

For several issues we and our readers have been playing a "Hidden Name" game. Usually in our advertising columns we have been printing about a dozen names and addresses of subscribers. These names stand alone and do not have any connection with advertisements or articles.

If you find your name and address printed in this manner, we will send you \$1.00 if you will write and ask for

it within one week of the date of the issue.

Up to date practically every person whose name has appeared, standing alone on some page other than page 1, has responded and has received his or her \$1.00. Look carefully through this issue, and if you find your name and write promptly, your \$1.00 will be sent by return mail.

"We Want Flint Corn — But Try and Get It!"

(Continued from Page 3)

So run their monotonous replies. I have talked with farmers. One fine old-fashioned farmer (age 79) in northern Vermont said that he raised corn. I went into his barn. He kept cows, sheep, hogs—and he raised corn, shucked it, piled his corn-shed full, and then every day shelled enough in his hand sheller to feed the stock. He was a real, independent, self sufficient farmer. The old man was as straight as a ram rod and as healthy as a boy of 30.

When I read in your recent article about flint corn that there were 45,000 acres grown in New England, the mystery began to deepen even more. The Vermont Guild of Old Time Crafts & Industries has opened a new market for corn and no corn man seems interested. And our mill is not the only mill in the United States—there are many others. Stone ground corn meal is becoming popular, as are stone ground wheat, buckwheat, rye and other flours. People are waking up. One of the biggest evidences is the recent growth in sales of stone ground corn meal, wheat, rye and other grains. This has and will continue to make a new and growing market for farmers.

The *American Agriculturist* can do a lot of good in spreading the word about this new but old use for cereals. Perhaps also the farmers' hard working wives will lead happier and better lives if they can have the rich, nutritious stone ground meals and maple syrup and honey and other things our forefathers ate and flourished on.

Dr. Naylor's MEDICATED Teat Dilators

Safe and dependable treatment for Spider Teat, Scab Teats, Cut and Bruised Teats, Obstructions.

Dr. Naylor Dilators are sterilized, medicated and saturated with the antiseptic ointment in which they are packed. They have a deep yielding surface of soft absorbent texture which fits either large or small teats without overstretching or tearing and which carries the medication INTO teat canal to seat of trouble.

The Only Soft Surface Dilators

Whether infection at end of teat, cut or bruised, the resulting condition which closes teat canal making it hard to milk is always the same — INFLAMMATION.

To relieve inflammation in a wound or bruise the treatment most universally used by the veterinary and medical profession is—to apply antiseptics, healing agents and a sterilized, soft absorbent dressing.

Dr. Naylor's Medicated Teat Dilators apply this same treatment for removing inflammation from the milk canal of cows' teats. They carry antiseptics and healing agents into teat canal to combat infection and promote healing.

The dilators themselves are sterilized, soft, absorbent dressings which protect the inflamed area, absorb inflammatory exudates and keep teat canal open in its natural shape while tissues heal.

NEARBY MARKETS for NEARBY POULTRYMEN

Eggs and the War By J. C. HUTTAR

NAPOLEON BONAPARTE once said that an army moves on its stomach. Since his reputation gives him credit with having been a pretty fair military man, he probably knew whereof he spoke. This fact apparently makes some folks feel that all food, like steel

J. C. Huttar

and oil, is war material and must increase rapidly in value as the war increases in intensity. But it seems to me that, if Napoleon had gone into details on his statement, he wouldn't have put eggs at the top of the list of army movers.

In other words, if a can of beans would move an army a foot a dozen of eggs would advance it only a quarter of an inch. Not that eggs aren't a great food. They are. But they're too sensitive to shock and rough handling to set down alongside of exploding shells. The army's supply wagons can't always travel on paved roads either.

So, the effect of war on egg prices works through the people back home. Its action is indirect and so, much slower. It works about like this:

1. The agriculture of a nation at war changes toward the increased production of grains, beans and meat. The production of other things goes down. Increase in feed grain prices hurries the shift away from poultry.

2. Import and export routines are changed by the war. The warring nations often have their exports greatly reduced and have to import their foods from different nations than in peace times.

3. Neutrals who are free to supply the belligerents shift their agriculture more slowly but still toward those products which the warring nations need. And neutrals may also have to replace certain foods which they normally get from one of the warring nations by growing more at home and importing from other neutrals.

This War and Eggs

Let's translate these changes into modern times.

The warring nations reduce their egg production and produce more wheat, corn, hogs, beef, beans, etc.

Holland and the Scandinavian countries in peace times export a lot of eggs.

Among the present belligerents, Britain is the only important importer of eggs. Among the neutrals, South America and the West Indies, including Cuba, are the chief egg customers.

Now, just in case it has slipped your mind, there is a fair-sized war going on in Asia too. One of the belligerents there, China by name, has long been a big exporter of eggs, chiefly canned and dried eggs.

It seems quite definite now that Canada and our country will be called on to supply the demands of both Britain and the neutral egg importers in the late winter, spring and early summer. Then during the rest of the year Argentina will have to do the shipping, for that will be the time of its flush production, since the seasons are opposite to ours in the Southern Hemisphere.

I want to say again, as I have many times before, that we must not lose track of canned eggs. While the kind of eggs we produce and market

in the Northeast practically never get into cans, because they're too high priced, the use of the lower grades for this purpose takes them out of price competition with all eggs marketed in the shell. So let's not forget the Chinese war.

What's Going On

In times like these I believe the toughest job we have is to separate fact from fiction. The ratio is about one to three. On the side of facts we have only facts but on the other side we have rumors, propaganda and wishful thinking.

Here in the heart of the world's biggest egg market, where speculation is part of the business, rumors are so thick you can cut them with a dull knife.

Without a war we would have a very weak egg market. But rumors of export business, present and future, together with the sure feeling that all prices must soon advance, add unnatural strength to the market. Because of this, more eggs went into storage in April this year than last. The increase was 25%, equally divided between shell and canned eggs. The total in the country was, on May 1, only 6% below last year (we had too many in 1939) while on April 1 we were 25% below.

Canadian government reports say that its hatcheries are turning out more chicks than last year, while in the U. S. we are running 15 to 20% below last year (the May hatchery report will be off the government presses by the time you read this).

I get a weekly official report from Canada which says that *no actual export business in eggs has developed yet*. I have a confirmation this morning direct from the U. S. Department of Agriculture's New York office that 9,000 cases of eggs for Scotland have actually been bought and loaded on ships which sail May 15 and 18.

So much for facts.

The Last World War

Looking at the latest publication of Farm Economics, from Bill Myer's department at Cornell, I see that in 1915 eggs were lower in price than in 1914 (the war started August 1, 1914), but in 1916 prices were substantially higher and continued going up until 1920.

Summary

As usual, I feel obliged to put all these egg scramblings together and give you my interpretation of them. So, as Charlie McCarthy would say, "Brace yourself, here it comes."

On the unpleasant side we have a few more hens, too many storage eggs (perhaps), a bigger hatch of chicks in Canada and only fair consumption of eggs by our own people.

On the other side of the ledger we have less fact and more prospect. The fact is that the U. S. hatch of chicks is substantially smaller so far. The prospects are that there will be some export business and that the general price level will be higher.

My interpretation is that the outlook for eggs is better than it has been for 6 months, but still nothing to write home about. If I had to make my living keeping chickens and had a farm that would produce grain, I'd grow more wheat, corn and oats than I was in the habit of doing.

And as my parting shot—Broilers, being a meat, look good to me from here on out. I say this especially in view of the lighter hatch.

You be sure to draw your own conclusions, though.

Hall's Chicks

Woodsman, Mark That Tree

(Continued from Page 10)

paper pulp, and the job of cutting and assembling this wood for delivery to the pulp company will be completed this summer.

Thus through cooperation there comes to the old Tioga County hills a new enterprise which, while small, will still bring to farmers some badly needed extra dollars.

Interesting also is the pioneer work of this woodland cooperative because it points the way for other groups of woodland owners throughout the Northeast to go and do likewise, thereby killing two birds with one stone, so to speak; first, increasing the care and development of our thousands of acres of woodlands, and second, getting for the farmer-owner more cash returns from this important crop. You may be sure, for example, that after a farmer has realized some money from his woodlot he will be more careful about turning his stock into his woods and thus destroying their future possibilities.

It is interesting also to remember that many of our poorer lands are going back to woods or have already gone. Therefore, any plan for treating this increasing amount of land in woods scientifically and for increasing the cash returns from these woods is well worth while.

Don't Hold Back the Pullets

Is there any danger in forcing pullets to the point where they will lay before they are fully matured?

In recent years it has come to be generally recognized that the date of the first egg is determined more by heredity than it is by feeding. The important thing is to raise the pullets well, and in our opinion there is no good reason for trying to hold them back by cutting down on the mash and increasing the amount of scratch grain.

Do You Want Farm Help?

We have had a number of letters recently apparently from fine people who are making the fight of their lives to keep off from relief, or who having been forced on relief want to get good jobs and support themselves again. Many of these people are experienced farm workers. If you need help, write full details immediately to American Agriculturist, Department F, Savings Bank Building, Ithaca, and we may be able to suggest somebody whom you can interview.

"Insure everything in the place, but the clock. My employees keep their eyes on that."

JUNIATA LEGHORNS 26 years of breeding assures you of larger and better Chicks, higher livability, pullets mature early, larger eggs and higher flock average. Breeders are large birds of Tom Barron Strain on free range. Write for FREE photos of our farm and stock. Chicks as low as \$5.50 per 100; Pullets \$11.-100; Cockerels \$20.-100.

HOME CANNING of Fruit Juices

By Mrs. Grace Watkins Hockett

Much of nature's bounty is captured in a cup of fruit or berry juice. Use it for beverages or for jelly.

FRUIT JUICES have always had a special appeal in hot weather, even in the days when they were obtained chiefly from berries and grapes. And now that juices of apples, tomatoes, rhubarb and some of the less used fruits have been added to the list, there is no limit to new and interesting combinations.

The "flash" method of pasteurization now makes it possible to keep in juices more of the aroma, flavor and appearance than formerly, particularly in the case of the cloudy juices, nectars, etc. This method is practiced commercially by filling cans or jars with hot (170° F.) juice, and then holding in a pasteurizing tank filled with water at 165° F. for 10 min. At the end of this period, glass containers are cooled in warm (125° F.) water and then in cold water. Tin cans are put at once into the cold water. It is important that cans be full, since air causes changes of flavor. This is possible by the "flash" method, whereas when bottled cold, head space of $\frac{1}{2}$ " to 1" must be left.

It is possible to construct a simple, inexpensive "flash" pasteurizer for approximately \$15.00, and it probably would be worth its cost where there is a great quantity of material to be converted into juices. The New York State Agricultural Experiment Station at Geneva has conducted extensive experiments on pasteurization of fruit juices and has several helpful bulletins on the subject. However, in ordinary quantities the usual home canning equipment is sufficient for the purpose.

Rhubarb Juice

Cut rhubarb into small pieces. The large older stalks, not tender enough for sauce, may be used. Just cover with cold water. Cook slowly in a covered kettle until soft but do not boil, since boiling affects flavor.

Strain out the juice by pouring the cooked rhubarb into a jelly bag and let drip overnight. In the morning, pour off the clear juice carefully

to avoid mixing in the sediment; or clarify the juice by pouring through three or four layers of cheesecloth. Add $\frac{1}{2}$ to 1 cup sugar to each gallon of juice. Fill the scalded jars with the juice, place a new rubber on each jar, partially seal by adjusting the upper clamp or by screwing the lid down and unscrewing it $\frac{1}{2}$ turn.

Place on a rack in a large kettle, keeping water at least 1 inch above tops of jars and keeping at a temperature between 160° and 170° F. for 20 to 30 minutes, counting time after temperature reaches 160°.

Remove from water and completely seal. Cool as rapidly as possible, avoiding a draft on glass jars.

Rhubarb juice combines well in a beverage with less tart juices besides adding tartness to jellied salads or desserts, and pudding sauces. For making fruit punch in large quantities, rhubarb is a good inexpensive source of iron-rich, tart material.

Cherry Juice

Cherries, especially the sour, red ones, yield a beautiful red juice. Stem, pick over, wash (do not pit) cherries. Use only ripe, perfect fruit—the final product is no better than the quality of the fruit which is used originally. Crush cherries with a potato masher or the bottom of a fruit jar in the pan in which they are to be heated. Add a few tablespoons of water for each quart of fruit. Heat over a pan of water to about 170° F., at which time the fruit should be somewhat soft. Allow to stand for about 5 min. then drip overnight in a jelly bag.

Next morning strain through four thicknesses of cheese cloth disturbing the sediment as little as possible. Allow $\frac{1}{2}$ to 1 cup sugar per gallon of juice (unless it is to be used for jelly) and process at 175° F. in water bath as for rhubarb juice. Scalded bottles may be used instead of jars; all covers should be scalded. A single bot-

tle capping machine can be bought at most hardware stores.

Every year I put up a few jars of currant juice as a special treat, because combined with raspberry juice it makes such a beautiful and unusual beverage. The combined juices of both make wonderful jelly, as every housewife knows.

Berry Juices

Place berries (strawberries, raspberries, blackberries—and their hybrids) in a colander, move up and down in a pan of cold water, cap and drain. Allow two or three tablespoons water per quart of berries and from this point follow instructions as given for extracting and pasteurizing cherry juice.

Tomato Juice

Use fully ripe, firm tomatoes freshly picked, and with no spots or other defects. Work with small quantities—say a peck of tomatoes at a time—and work fast. If the juice stands either hot or cold, it loses flavor and vitamin value. Wash tomatoes, core and cut into small pieces. Peeling is not necessary but improves the flavor of the juice. Simmer (do not boil) until soft, strain at once through a fine sieve. Bring the strained juice to an active boil and transfer boiling hot to hot containers. Add 1 teaspoon salt to each quart of juice and 1 to 3 teaspoons sugar if desired. Carefully wipe tops of jars and rubber rings and put lids in place. Partially seal. Process the tomatoes for 5 min. in a hot water bath, beginning to count the time when the water begins boiling rapidly again after jars have been put into it. Remove from water bath, cool promptly and store in cool, ventilated place — also dark if tomatoes are in glass containers.

Apple Juice

Apple juice as a beverage is growing in favor. For many years housewives have extracted apple juice and canned it for use later in the jellies. Newer methods of handling have placed it on the popular beverage list also.

Wash thoroughly firm, tart apples, rather than soft ones which are apt to be too sweet and to make a great deal of suspended matter after standing. The following varieties are recommended for making good juice without blending with others: Baldwin, Northern Spy, Winesap, Golden Russet, Rhode Island, Greening, Wealthy, Wagener, Jonathan, Hubbardston, Roxbury Russet, King, Grimes Golden and Canada Red.

Cut into small pieces, cover with water (about 1 pint of water to each pound of fruit). Cook only long enough to soften (about 15 min.), since long cooking causes loss of flavor, darkens the color and may extract unpleasant substances from the seeds. Furthermore if the juice is to be used later for jellies some of the pectin is changed into pectic acid. Drip through jelly bag. For jelly making, more water may be added to the pulp and the mass simmered for 30 min. to make a second extraction from fruits rich in pectin—crabapples, apples, grapes, currants and quinces. However, this is hardly to be recommended for beverage purposes. Apple juice to be used for jelly is left unsweetened; if to be used for beverage, allow $\frac{1}{2}$ to 1 cup sugar per gallon of juice and process in hot water bath by the same method recommended for cherry juice.

Grape Juice

Grape juice combines color, aroma, flavor and acidity, and makes a refreshing beverage within itself. It also blends nicely with other fruit juices or with (Continued on Opposite Page)

BE KIND to Your FIGURE

ALLOVER lace will feature prominently in real summer fashions. Colors in laces are delicate — gray and the pastels, dusty pink, crushed rose, linen blue and the beiges with pink or yellowish cast. As every smart woman knows, black does the most for reducing apparent size. Combine with white accessories.

FROCK PATTERN NO. 2795 is designed to combine style with slenderizing features, a combination not easy to find. Every detail is carefully worked out for becomingness as well as ease in construction. Sizes are 36 to 48. Size 36 requires 4 1/4 yards of 39-inch material, 1/4 yard 39-inch contrasting.

LITTLE GIRL'S SELF-HELP DRESS PATTERN NO. 3242 is designed to help the little miss to dress

"Hello, dear. What's new?"

COMRADESHIP

By Jessie M. Dowlin.

Little farmhouse on the hill
Between the orchard rows,
He was kind who set your frame
Among the apple blows.

He was thoughtful, for he planned
On comradeship of leaves
Uniting in a gentle song
Around your cordial eaves.

He was wise in pruning boughs,
For well he understood
That hearths can lodge no friendlier fire
Than trusty apple wood.

herself. Ice cream cone pockets are an added amusing feature. Pick a material patterned in miniature and in colors suitable to your little girl's coloring. Sizes are 1, 2, 3, 4 and 6. Size 4 requires 1 3/8 yards of 35-inch material, 3/8 yard 35-inch contrasting.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Summer Fashion Catalog.

Home Canning of Fruit Juices

(Continued from opposite page)

carbonated beverages. Only fully ripe, sound, clean grapes should be used. They should be washed and stemmed, crushed and heated to 140° to 145° in an aluminum or enamel kettle. The top of a double boiler will do nicely. Continue heating at this temperature until the bright purplish red color spreads through the mass. Temperature is important because if too low the juice does not extract well; if too high, tannin is extracted, producing a bitter flavor.

Pour hot juice into a jelly bag and press as dry as possible while still warm. This gives a cloudy juice. Heat to between 165° and 180°; skim the foam from the surface and fill one gallon jugs or large fruit jars which have been previously sterilized. Fill jars full enough to flush out any foam. Watch temperature carefully, as best results occur between 165° and 180°. Pasteurize jars in hot water bath at 165° for 20 min.

Keep jars of pasteurized juice in cellar or dry storage for from 3 to 6 months. This allows crystals and other substances to settle out. Then the juice is ready for rebottling and repasteurizing. Either siphon off the clear juice above the sediment or filter through a jelly bag or double layer of cheese cloth. Sweeten the juice to taste, about 1 tablespoon or more of sugar per pint of juice. Unless the juice is used immediately it should be pasteurized a second time.

WOMEN IN "40's" YOUR 40's

Read This Important Message!

Do you dread those "trying years" (38 to 52)? Are you getting moody, cranky and NERVOUS? Do you fear hot flashes, weakening dizzy spells? Are you jealous of attentions other women get? THEN LISTEN —

These symptoms often result from female functional disorders. So start today and take famous Lydia E. Pinkham's Vegetable Compound. For over 60 yrs. Pinkham's Compound has helped hundreds of thousands of grateful women to go "smiling thru" difficult days. Pinkham's has helped calm unstrung nerves and lessen annoying female functional "irregularities."

The best known and one of the most effective "woman's" tonics. In liquid or handy to carry tablet form (similar formula). Try it!

MY ADVENTURE

with Mary Inez

By C. A. STEPHENS

IN THE fall of 1871, while I was a boy in my teens and living on a farm in Maine, I was sent with a yoke of oxen and a large two-wheeled cart to haul a load of supplies to our lumber camp up in the "Grant" as we called it. The distance was nearly twenty miles, much of the way through the woods; and as oxen are slow, a day was required for the journey to the camp, and another to return home.

The road was about as bad as a road can be—a mere trail, not much used till after snow came. But our loggers were already at work up there, and were running short of supplies. So the old squire started me off with our steadiest yoke of oxen.

I had three bushels of white beans, two barrels of pork, a barrel of flour, a ten-gallon keg of molasses, four bushels of Indian meal in two bags, a two gallon keg of vinegar, two barrels of cooking apples and one of eating apples, four bushels of potatoes, four of turnips, half a barrel of sugar, two boxes of salt, and some other articles, besides half a dozen axes, three peevies and two steel wedges—altogether about a ton in weight, but well packed in the cart body and securely lashed on account of the rough road.

It was not deemed a hazardous trip for me. Old Bright and Broad were used to carting. They were two eight-year-old Durham cattle, seven feet and four inches in girth, and steady as clocks. However rough the road, they could be depended on to move calmly and slowly. In fact, they were rather too slow; two miles an hour was about their natural rate of travel, unless they were hastened with the goad.

I was given an early start from home, stopping only for a half hour to bait by the roadside. I reached the camp just at dusk.

In prudence, I should have started on my return trip before sunrise the next morning; but after breakfast, I was tempted to go off with two of the younger men to see a beaver house at a pond in a stream some distance from camp. With one delay and another, it was noon before I made a start.

I now found that I was to have a passenger in the cart, the wife of one of the loggers, who had come up to the camp on foot during the forenoon from their house, fourteen miles below, to bring her laboring husband his winter supply of socks and knit leggings. As there was no place for her to stay overnight, she had to return that afternoon; and as she was tired from her long walk, I could do no less than offer her transportation, if she deemed riding in the cart over that rough road easier than walking—a subject for doubt.

She decided to ride, and her husband, having found a half barrel for her to sit on, asked me to drive very carefully. The affectionate manner in which he then took leave of his dear Mary Inez—as he frequently called her—impressed my youthful mind with a high sense of her preciousness.

We had not proceeded far when we began to have music. The previous morning some one whose duty it was had forgotten to "grease the cart", that is to lubricate the large wooden axle of the wheels. It had not run dry during the outward trip; but now it began to call out piercingly for grease.

I knew very well what the matter was. But there was no help for it now, so I drove on. There was no danger that the wooden axle would heat, but the sounds that issued from it were horrible.

Groo-oo-oo-ee-ew-ew-aw-ook! Groo-oo-oo-ee-ew-ew-aw-ook! at every revolution. It soon became about as much

as the human ear could endure.

I had driven slowly to spare my passenger the jolts. But the sky had been growing overcast since morning, and now the certainty of rain led me to hasten our progress with the goad.

This proved rash, for immediately an unusually hard jounce over a log threw the woman off her seat. Falling forward, she struck her nose on the rail of the cart body, with the result that the blood began to flow.

She got out of the cart and sat down on a stone, and a very distressing interval followed. About all I could do for her was to fetch cold water in my bucket from a rill at a distance, and then look on. It seemed to me that she must surely bleed to death. The hemorrhage continued for nearly an hour. I thought it would never stop, and was filled with panic. If she bled to death there, I was afraid her husband might accuse me of murdering her, for I felt a little guilty because I had driven the cart so fast.

The flow of blood stopped at last, and looking very pale and disheveled, the woman got into the cart again. The oxen, meanwhile, had lain down in the yoke, and were chewing their cud.

We went on. But it was not long before sleet began to fall, the beginning of one of those southerly storms which in that part of the country often come on in the afternoon, increasing in violence during the evening and night. Evening was at hand, for at this season the afternoons are short.

Passing an opening where several haystacks had been put up for the lumber camps, I stopped; and bringing large armsful of the hay, I piled it high about my passenger's seat, to keep Mary Inez from bumping her nose again. As the wayside was very brushy, I now took up my own position on the cart tongue, where I could hold on by the "sword" at the front end of the cart body, and hastened old Bright and

Broad on with pricks from my goad.

At best, however, we could proceed only at a walk—and with every turn of the wheels that long, loud and dismal Groo-oo-oo-ee-ew-ew-aw-ook! went echoing through the forest. Cloudy nights in November are always very dark, but I do not believe that ever a darker one than this descended.

I had a whale-oil lantern, which we always carried when out with a team; and lighting it, I tied it by the ring to the top of the sword, whence it cast a feeble light on the backs of the oxen and on the wan face of my passenger.

We went squeaking and bumping on our way for two or three miles more, the oxen keeping the road from an instinct which cattle have, rather than from sense of sight.

Owls hooted, as they often do before storms; and once the oxen stopped short and were very reluctant to go on, probably from scenting a bear in the road ahead.

Shortly afterward we forded a brook, and then the woman knew where we were.

"'Tis three miles from here home. We'll soon be there," said she, and became more cheerful.

She had been anxious concerning her three small children, left in the care of their grandfather, an old hunter and Maine woods guide.

But the worst of our adventures was still to come. As we plodded up the ascending ground beyond the brook, I heard a loud snort behind us, and above the squeaking of the cart, caught the sound of hoofs splashing through the brook.

"Somebody's coming!" exclaimed the woman. Indeed, my first thought was that a man on horseback was galloping after us, although to gallop a horse over such a road in such darkness would have been a feat worthy of the Wild Huntsman himself.

In a moment the sounds of galloping came up close behind us, and I shouted, "Hello, there! Wait a bit and I'll turn out!" and jumped down to execute the promise.

But with another wild snort of his horse, the rider turned and went galloping back down the hill to the brook and across it.

"My goodness!" cried the woman. "He must be crazy!" I thought so, too;

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

We Have This Hour

We gathered pink anemones

Along the paths of spring,
And paused beneath a budded bough
To hear a bluebird sing.

We have this hour of warm delight,
Whatever years may bring,
This song, this petalled incense,
For sweet remembering.

—Anobel Armour,
Kansas City, Missouri.

moreover, I was mystified and began to be frightened.

Another snort far back along the road blended with the creak and groan of our axle, then more galloping; and again the wild rider came close up behind us!

Again I shouted, "Hello, there! Who are you? What do you want? Do you want to go by? If you do, say so."

The only response was another snort and another mad gallop back along the road.

"I caught a glimpse of something!" said the woman in an awestruck whisper. "It looked like an old stump—as if he was carrying an old stump over his head!"

This was far from lucid or explanatory. I had discerned nothing myself. The glimmer of the lantern was a little nearer my face than that of my passenger and prevented my seeing. A chill stole over me—fear, no doubt. The oxen, too, were hurrying toward at an unusual rate. One of them gave vent to low mooring sounds.

We had gone on but a few rods, however, when our strange pursuer rushed after us yet again at a furious gallop, as if to ride us down, and came up to the very tail-board of the cart. Once more I shouted, "Hello, there! What's wanted, anyhow? Are you trying to get by us?"

Again it wheeled, snorting. Mary Inez screamed outright, then hid in the hay.

"Oh, I saw that stump again!" she cried. But I saw nothing.

The thing galloped away, but instead of going back far, plunged into the woods to the right of the road. We heard it go tearing through the fir growth, crash on crash. The sounds moved past us, describing a circuit through the woods, then crossed the road ahead, came completely round us and approached from the rear again.

I now felt sure that no human being was concerned in the demonstration, since a man could hardly ride a horse at such a rate through thick woods. A suspicion as to what it was began to dawn in my mind.

Meanwhile the oxen had been hurrying on at a great rate, and presently we heard some one shout, and saw through the storm the glimmer of a lantern in the road ahead.

"That's father!" cried the woman. "We're most home!"

As she surmised, it proved to be her father, Jared Robbins, who had heard the distressful squeaking of my wheels, and guessing that his daughter might be with me, had come to meet her.

When we told him that we were being followed by some prodigious beast, the old guide at once confirmed my

(Continued on opposite page)

The Song of the Lazy Farmer

MY NEIGHBOR has an awful pain most ev'ry time it starts to rain, he's mighty busy with his work, he likes to do it in a jerk, so when rain causes him delay, he storms around and frets all day. He likes to keep his work ahead, so when rain drives him in, instead of sittin' round to rest his bones, he just complains in saddened tones because his plans are all upset, account the weather is so wet. When rain delays him with his toil of plantin' seeds and stirrin' soil, it makes his disposition sour, and so he grouches hour by hour. He don't enjoy his leisure when he's got a chance to rest again, but frets around because the sun don't shine on work that ain't quite done.

Hard work alone won't make a crop, for you can labor 'til you drop and still not raise a bloomin' thing, if Nature don't help out, by jing. Us farmers think we grow our stuff, and if the yield is big enough we brag about our brains and skill and think we're mighty smart until some day we come to realize we ain't the one who won the prize. We only do a little bit, Dame Nature does the most of it, and when the corn grows green and tall it's cause she made the raindrops fall, and sun to shine and 'o put the vim into the crop; our chance is slim unless she will cooperate, no matter if we toil till late. Without Dame Nature on our side we work up blisters on our hide and don't git nothing for our pains, so I sit peaceful when it rains and grab myself some rest, by gee, my partner's doin' work for me.

By CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of De-meter of the National Grange.

THE POSITIVE action taken by the National Grange in vigorously fighting the transfer of the Farm Credit Administration from its former independent basis to complete control within the Department of Agriculture at Washington has met with tremendous approval among Northeast Granges, as expressed by recent action taken in scores of Grange meetings, both subordinate and Pomona. These Granges are all within the First District of the Federal Land Bank System, whose administration has been so satisfactory and has rendered such distinct service to Northeast farmers.

The resolutions which Granges have passed, coupled with hundreds of letters and telegrams forwarded to members of Congress at Washington, have expressed in no uncertain language the determination of the Grange to fight for a continuance of the independent setup in administration which has made the Farm Credit System so successful. Senators and Congressmen have been fairly deluged with appeals from their Grange constituents in the territory mentioned, and farm sentiment in that section is unanimous in support of the Grange fight.

* * *

IN A VERY interesting public ceremony at Marlboro, Mass., on the evening of May 8, a memorial tablet erected at a conspicuous point on the high school lawn in the very center of the city was dedicated to the memory of two former masters of the Massachusetts State Grange, both active members at Marlboro, Arthur A. Brigham and Elmer D. Howe, and both now deceased. The tablet was accepted by Mayor Ingalls in behalf of the city and the school department was represented by Superintendent Carr. Last November, Marlboro Grange planted a beautiful evergreen tree on the high school lawn, and the present marker is placed at the foot of the tree on a large boulder brought from the original farm owned and operated during his lifetime by Mr. Howe.

* * *

HAPPY INDEED these days are the Grange members at Middletown, Connecticut, where an energetic financial policy and no end of Grange effort the past two years have made it possible to pay the last dollar of indebtedness on the new Mattabesett Grange hall, with a mortgage-burning one of the joyful events of a recent meeting. Mattabesett is one of the strongest subordinates in the Nutmeg State and although its home is located in the heart of the city, its membership is drawn from a large number of prosperous farmers in that excellent agricultural area.

* * *

NEW HAMPSHIRE FARMERS have good reason to bless the Grange again, because of the vigorous leadership it has shown, with State Master William J. Neal at the helm, in extending the rural electrification program throughout farming districts of the Granite State. Sullivan County is one of the sections receiving special attention, with more than 50 miles of electrification projects already in process of construction; while in the state as a whole more than 700 miles of rural electric lines have been planned for the coming season, and fully half that layout already under contract and in

many instances actually started. Not less than \$750,000 is expected to be available for New Hampshire construction during the present season.

* * *

LATEST ACCESSION to New England Grange Building on Eastern States Exposition grounds at West Springfield, Mass., is the purchase of a substantial number of modern all-steel chairs for the auditorium, following a successful drive for funds for this particular purpose, to which the Granges have responded well. Still more seating equipment is needed for the building, and one Massachusetts Grange has set its neighbors a good example by a voluntary contribution of \$25 for this project.

Today in Aunt Janet's Garden

Plan and Plant Window Boxes

WINDOW BOXES can be made a very attractive feature of home decoration. Just at this season when house plants need repotting is a good time to combine the two jobs, thereby saving labor, time and muss.

Not all houseplants are equally suited for use in window boxes. The ever-blooming begonia and some geraniums seem as well suited as any. Other upright flowering plants suited to a sunny exposure are ageratum, dwarf canna, cuphea (cigar plant) heliotrope, lobelia, mignonette, nasturtium, nierembergia and petunia.

Certain foliage plants are also good for the sunny window box: aspidistra, coleus, dracaena, croton, dusty miller, silk oak, golden feather, Phoenix palm and double sweet alyssum. But upright plants alone are not sufficient; the box needs trailing plants to give a feeling of unity between the house and

its surroundings. Perhaps you have some of these either in pots or in the border outside: English ivy, German ivy, parlor ivy, ivy geranium, Kenilworth ivy, ground ivy, iceplant, potato vine, trailing fuchsia, trailing lantana, trailing lobelia, vinca major and wandering Jew.

It is a good thing to know which plants tolerate shade, for sometimes that is the only location possible. In such a case, these are recommended: aspidistra, Boston fern, dracaena, fancy leaved caladiums, asparagus Sprengeri, silk oak, impatiens, pteris ferns, rex begonia, double begonias, artillery plant, wandering Jew and most of the ivies, and small palms.

An attractive sunny window box, requiring very little plant material, can be made by using dwarf nasturtiums in the back and climbing nasturtiums to trail in the front. Another simple box is planted entirely with dwarf petunias. A more pretentious box may have red geraniums in the back, dusty miller and asparagus fern in front of them, and vinca major trailing over the sides. A still longer box might have pink geraniums at the two ends, white petunias next to them, and a dracaena in the middle. Then place blue ageratum in front of the pink geraniums and complete that row with dusty miller. At the front edge of the box, place two ivy geraniums with a cissus discolor (begonia tree vine) between them. The latter is a pretty, colorful vine obtainable at the florist's.

A shady window box might have the back row of asparagus Sprengeri at each end, an impatiens plant next to each of these and a Boston fern in the middle; wandering Jew for a trailing plant over the edge completes the picture. Another scheme for a shady box is Boston fern at each end, a dracaena next to each of them and a silk oak in the center. In the front of these place a row of rex begonia with Kenilworth ivy trailing over the front.

Personal Problems

Bride Provides Linens

Dear Lucile: I am engaged to be married to a young fellow with a good income. Should I buy towelling, pillow tubing, etc., or should I let him buy them?—Isabell.

No matter how well off your fiancé may be you should purchase your own linen if at all able. The girl or her parents should stand this expense. If neither are able the young man may assume it, but it is an expected obligation on the part of the bride and part of the "dower" she should bring her husband.

* * *

Girl Speaks First

Dear Lucile: When I am walking down the street and I meet a fellow I know, who should say hello first, I or the fellow? When the fellow knows you very well should he say hello, or when you meet him in the store should I always say hello to him first all the time?—Wondering.

When a girl meets a boy she knows, on the street or in the store or other public place, she should speak to him first.

* * *

Wants to Adopt Child

Dear Lucile: I have been married 10 years; am 32 and my husband is 36. We have always wanted children but they have been denied us. When we found out we would never have children of our own, we began planning on adopting one when we were able.

Now we are fixed so we could adopt a child. But I don't know what has come over my husband. He doesn't want to carry out our plans. Whenever I mention it he just says, "maybe" and "someday" and changes the subject. We are soon going to be too old to have babies around.

I love my husband but that doesn't seem to be enough to keep a home to-

gether. I feel I just can't go on without a child to love and care for. I know we would both be happier with some object in life.

Shall I leave my husband to find happiness that we can't seem to find together, or shall I just go on living my unhappy, childless life with the man who could make me happy but is either too selfish or afraid to undertake the responsibilities of a family?

I would like to hear from others who perhaps have gone through the same thing. I need help very much—Aching Heart.

While I can understand your longing for children, I do not think you should let this situation estrange you from your husband. Perhaps it has grown to be such a big thing with you that you are looking at it out of its true proportions, which makes it impossible for you to talk about it calmly with your husband and

"If you won't accept me, you might at least help me up!"

Rainbows

By CHARLOTTE R. MILLWARD.

I never see a rainbow in the sky
But that my heart leaps high in
sheer delight.

Soft, sunlit shades against a
darkened cloud
Somehow make all the world
seem glad and bright.

This lovely mystic crescent
gleaming like
A massive prism arched against
the sky

Is but a magic blend of rain and
sun:

A symbol that the storms of life
pass by.

For I think He who makes the
bow at length

Will blend with every tear of
grief and strife

Some golden dream, some joy be-
yond belief,

And set a rainbow in each cloud-
ed life.

try to come to any understanding.

Perhaps he feels that he is not yet financially able to take on added responsibility; perhaps he feels that you should both have a few more care-free years without being tied down with a child. At 32 and 36 you still have a great many years before you are too old to enjoy a baby.

At any rate, I do not see that you would be bettering anything by leaving your husband. Rather, I would say be patient a while longer. He may not have abandoned the plan—just postponed it.

If others have opinions on this matter, I would welcome their letters.

My Adventure With Mary Inez

(Continued from opposite page)

suspicion as to what it was.

"That 'ere's a moose!" said he. "He heard your cart ex creaking, and he thought 'twas another moose, a cow moose, bawlin'! I don't wonder. I vum, I thought 'twas one myself when I heard ye comin'!"

"Now put out your light", the old man continued, in some little excitement. "Put out your light and I'll put out mine. Then you drive on slow and let her creak, while I hiper back to the house and get my rifle."

The old man hastened away. And getting down from my perch on the cart tongue, I drove slowly into the opening where their house stood. Robbins soon came out with his gun; but although we heard the moose snort several times at a distance, the animal did not approach the cart again.

It was now about nine o'clock, and owing to the storm, I decided to remain there for the night. Before morning the sleet changed to snow, as much as five inches having fallen. So inclement was the day that I was in no haste to set off.

But the old woodsman, Robbins, had risen and gone out at daybreak to hunt the moose. He tracked the animal to a swamp some two miles away, and getting sight of it amidst a snowy thicket of young firs, brought it to the ground with his first shot.

He returned in great good humor; and after Mary Inez had prepared breakfast, I yoked my oxen, and going with the old man to the swamp, hauled the moose to the house. It had a fine spread of antlers—probably the "old stump" which Mary Inez had seen.

While I was assisting Robbins to hang up the carcass and dress it, a messenger from home, in the person of my cousin Addison, arrived in quest of me, riding one of the farm horses. The family had become alarmed for my safety, and had sent Addison to look me up. We were all the afternoon getting down to the farm, six miles, but had a quarter of moose meat to show for my adventure.

Kernels, Screenings and Chaff

By H. E. BABCOCK

I DO NOT know how events in Europe are affecting others, but

I am frank to say that several times since the Germans started their thrust through Holland and Belgium I have had to take firm hold of myself in order to get my mind on what I should be doing.

Effect On Us

From a purely selfish point of view I have been trying to think through what a German victory may mean to this country and how such a victory will affect your lives and mine.

Already the grain market has tumbled precipitously. This has had the immediate effect of lowering the purchasing power of the grain grower and temporarily putting the cattle feeder, the poultryman, and the dairyman in a better feeding position. Naturally, we all wonder whether or not the prices of pork, beef, eggs, and milk are themselves due for a tumble.

I don't know and you don't, but the situation certainly does not call for any expansion of the production of these products.

Armament Program

One effect in this country is certain to be a program of armament. This is likely to be expressed soon by great industrial activity. Temporarily this activity may bring about better farm markets.

For the long pull, however, any program in this country which calls for switching hundreds of thousands of men from the creation of wealth to the mere manipulation of wealth for protective purposes is bound to result in a lower standard of living. For this, we in the United States, even if we stay entirely out of war, will have Mr. Hitler to thank.

The Democratic Process

As I look at our present situation and what it may be by the time you read this page, I find that I can view with considerable equanimity lower grain prices, the loss of export markets, even the diversion of thousands of men from normal, useful lives into military enterprises.

The prospect which I cannot view with equanimity, however, — and it concerns me greatly — is that any war-like development in this country, even though it be merely confined to arming and preparing for war, is surely going to suspend and

perhaps in some instances cancel out entirely our democratic processes.

I have it on reliable information, for example, that in Washington — where without realizing it we have already centralized dictatorial power over agriculture — plans are under way for the regimentation of American farmers for war purposes. As a citizen I am willing to submit and support such regimentation, but only on one condition. That condition is that the regimentation shall be solely for the purpose of making it unnecessary to continue it.

Hereford Heifers

As I write this I am expecting the telephone to ring and the Lehigh Valley freight agent to advise me that he has two carloads of Hereford heifers on the private switch that we are fortunate enough to have at Sunnygables. These calves were shipped from Texas on May 10. They are the pick of a large number of calves, but my shipper writes me that the range in the Davis Mountains was very dry this winter and that these calves are pretty thin. I note that they weigh from three hundred to three hundred and seventy-five pounds apiece. They probably average around seven and one-half months old.

The calves we brought in last fall averaged four hundred and forty pounds, and I have already told how well they did on grass silage and a little grain. They have all been sold but

The three- and four-year-old mules we bought this winter are giving us great satisfaction. Despite the fact that they have been doing a lot of hard work they have held their condition and continued to grow. Sometime we hope to print a picture of the four sorrel mules which are now our main dependents for power on our Larchmont farm.

American Agriculturist, May 25, 1940

one which we spayed. This heifer we intend to fatten and kill for home use. We are all very much interested in seeing how good a beef animal we can make out of a high quality, spayed Hereford heifer.

I can already see that the spaying has begun to bring about a different appearance in this heifer from unspayed heifers of the same age. We are seriously considering spaying quite a number of the heifer calves we are expecting to arrive momentarily.

Down Mexico Way

By H. E. BABCOCK, Jr.

May 9, 1940.

"Wednesday night, May 8, brought the second rain since I have been here. The official records at Roswell put the total fall at .78 of an inch, but our own method of determining the fall at the farm (a tin can on a post) showed the fall to be well over an inch.

"The rain proved to be the answer to a problem which has been bothering us for the last two days. The 100-acre cotton field was coming up with a rather poor stand. Hard places in the field had not allowed deep penetration by the planter shoes and the seed had lain dormant. In order to bring this seed up we would have had to water the whole field.

"When the two cotton planters finished planting last Monday, they had been planting a total of 110 hours each. Two hundred and thirty-five acres were covered, which meant that we planted better than an acre an hour.

"Last Saturday we finished baling a field of yellow blossom sweet clover hay. This crop was put in primarily as a pasture crop, but with an abundance of small grain pasture we were forced to let the clover grow and make hay. It was cut just as it was beginning to blossom, and with immediate watering we hope to have it come on again for pasture. On May 11 we will start cutting a field of volunteer oats and alfalfa. The oats are just in the milk stage. We will clean up this field just in time to start our first-cutting of alfalfa.

"Last year the hay was handled with a steelwheeled pick-up baler which was traded off this spring for a rubber-tired baler. Never has the value of rubber tires been more graphically shown than when we saw the ease with which two horses handled the baler. With the steel-wheeled baler it was necessary to use four horses, which frequently had to be rested. The two big grays hauled the new baler all morning with stops only to rest the

baling crew; in finishing, a lighter team of mares was used.

"Layout of work for the next month hinges entirely on cultivation, irrigation, and haying. We have already cultivated the 100-acre cotton field, using three two-row cultivators and twelve horses. The whole field was finished in two and a half days. Most of the first half day was taken up in getting the cultivators adjusted so they were cultivating deep enough to cut the Johnson grass and yet not covering the cotton. The rain will serve to bring on the Johnson grass, as well as the cotton, and since the other fields are relatively clean we will start on the same field again as soon as it is dry.

"Cotton is a deep rooted plant which sends down a tap root about six inches even before the plant shows above the ground. It can be cultivated close and frequently, without any danger of root pruning or drying out. We will soon have to start chopping the cotton, but at the present time the geese are picking the Johnson grass in the rows."

Let the Record Decide

"Recently I received a letter from the National Old Age Pension Association of Washington, D. C., which, it is claimed is dedicated to the cause of federal pensions of \$50 per month to all deserving men and women of over 50 years of age. They asked me to send 10c in money for which I will receive 5 application blanks to give to other persons. I would like to have more information about this proposition."

This organization was founded in about 1933. It appears to have been rather quiet in recent years and is now again becoming active. We learn that the founder and president of this association was indicted on mail fraud charges in 1924, that he plead guilty and was sentenced to serve 60 days in jail and was fined \$500. This was for activity in promoting the Petroleum Investment Trust. Later he operated under the firm name of National Business Service Company and in 1927 he was again indicted for mail fraud but the case was dropped when he agreed to refrain from any violations of the statutes. With these facts as a basis we are willing to let our subscribers use their own judgment about sending money to this outfit.

* * *

Slow Delivery

"Recently I asked you to collect the money I had sent for some chicks which were not shipped when promised. Meanwhile I had ordered my chicks from another hatchery. The day after I wrote you the chicks arrived and now I have 200 chicks and I only have room for 100."

Few things are more irritating to a poultryman than to have a hatchery promise to send chicks on a certain date and then not to do it. However, to cancel the order and to send to another hatchery is likely to result just as has this case. The proper action to take in our opinion is to write or wire the hatchery—"Ship my chicks today or refund my money." In most cases that will bring the chicks. You might add to the wire: "If not shipped today, I will refuse to accept them." If the chicks are refused, that raises the question of the return of the money in case the check was sent with the order. As a publication we demand that hatcheries ship chicks when requested or return the money, if the customer asks for it. We realize that it is impossible to ship more chicks than hatch, and when a few hatches turn out badly it is necessary to delay some orders. In such a case we feel that it is only fair for the hatchery to tell the customer exactly when they

are going to be shipped, thus giving the privilege of cancelling the order if he so desires.

* * *

Jail for Muscle Shoals Lot Sellers

Thomas and Alfred Deal were recently sentenced to prison by Judge John J. Mullen of New York City as a result of fraud of about \$500,000 from the sale of lots near Muscle Shoals, Alabama. Evidence was produced that the brothers received as much as \$1,000 for lots that were worth not more than \$15. It was stated that the total value of the whole area was less than \$6,000 and the county taxes on each lot were about 3c. The lots, of course, were sold on the basis of flowery promises of the boom that would bring a handsome profit to the buyers. The Service Bureau has repeatedly advised readers to buy no land on a "sight-unseen" basis.

The trial resulted from the suspicions of a 65-year-old widow who had invested \$3,500 in a lot worth about \$100. She took a trip to Muscle Shoals and when she had located her purchase, she found it was in the middle of a swamp.

Wants Letters

"I wonder if you and your readers would help me in a survey that I am doing. I am a Junior in the State College of Home Economics at Cornell University.

"Right now I am interested in what farm people in all sections of the country live on (not financially), and how they live. I should like to know what they are interested in, their opinions on just anything, how they do their work, what they do for recreation. I should like recipes for low-cost dishes, and for foods peculiar to some particular sections of the country. What are people's labor and time saving devices?"

"I am a farmer's daughter myself. I love farm life, and I think I understand what I know of it pretty well; but I want to get other people's ideas and suggestions.

"Can you ask your readers of any sex or age to write me anything from a newsy letter to a post card, telling me anything they would like to about their lives, and inclosing a few recipes and suggestions for making farm life easier and happier?"

"I would appreciate this, and maybe I can pass some of the results of my survey on to the public."—Miss *Laurine Raiber, 5 East Avenue, Cornell University, Ithaca, N. Y.*

The Termite Racket

For some years termites and the damage they can do to buildings have been mentioned in the farm press. There is no question but that they can do damage, but unfortunately "termite proofing" has developed into somewhat of a racket.

If it should happen that a couple of men come to your place guaranteeing to rid your house of termites, caution is the word. We have heard of one case where a home owner paid \$500, with absolutely no results.

25.00 FRAUD REWARD—American Agriculturist will pay \$25.00 for evidence leading to the arrest, conviction and imprisonment for at least 30 days of any person or persons who defraud or attempt to defraud on the premises an AMERICAN AGRICULTURIST subscriber who has Protective Service Bureau Sign posted on his premises at the time such fraud is committed. Claim for the reward must be made promptly, not later than the date of conviction. Reward does NOT apply to conviction for theft.

American Agriculturist guarantees fair treatment of subscribers by advertisers. We refuse many ads known to be unreliable but if a fraud slips in, you are protected. To take advantage of guarantee, subscribers must say, "I saw your ad in American Agriculturist", when writing to advertisers, and then report unfair treatment promptly to Service Bureau.

Membership in the Protective Service Bureau is confined to our Subscribers. Free service rendered members consists of the adjustment of claims, collections of obligations owed by supposedly reliable business concerns (does not include obligations between individuals or any claim that is more than 6 months old); and any inquiries a subscriber may make concerning the problems of farming or home making. Address all letters to Service Bureau, American Agriculturist, Savings Bank Bldg., Ithaca, N. Y.

Spring is here This frolicsome heifer belongs to Charles Bates of Trumansburg, N. Y. It's her first day out after a long winter in the barn, and she feels great—but no better than her boss feels at the thought of how pasture is going to cut his feed bill. Cows on flush pasture not only need *less grain* but *less protein* in the grain ration. 18% Legume Dairy will fill the bill in practically all cases.

About as soon as the pullets have completely feathered out and the cockerels have been separated, they should get out on range. Sunshine and green grass are great things for growing birds, and a well-feathered pullet can stand pretty cold weather when the sun is shining.

By the time the pullets get out on range they should be eating grain and grit. Grain can be gradually increased until they are eating 50-50 mash and grain. Growing birds need mash—especially the vitamins and protein in the mash—to make good growth. For complete safety, Starting & Growing Mash is recommended. Growing Mash may be successfully fed if there is good green grass that the birds will eat, or if it is supplemented by milk.

* * *

Next to drouth and weeds, the biggest foe of the home garden is *the bug*. The most useful all-around dust for the small garden is $\frac{3}{4}\%$ Rotenone Dust, which will check bean beetles, cucumber beetles, and most other chewing insects, without leaving dangerous residues on the vegetables. G.L.F. Service Agencies have $\frac{3}{4}\%$ Rotenone Dust and other garden dusts in convenient 5-lb. packages—also hand dusters of all sizes.

* * *

An extra dividend. From J. A. McConnell's recent letter to committeemen: "The last week in April, G.L.F. patrons took through their distribution system 20,622 tons of feed—1033 carlots. It required eight carloads of baled bags to hold the feed. Five carloads of these were bags which came back from patrons. This means that \$20,000 cash went into patrons' pockets for bags in a single week instead of having to be spent for new bags. Not all dividends in G.L.F. are labeled patronage dividends. Using a bag that can make many trips and creating a market among ourselves for these bags constitutes a major dividend."

* * *

Pasture rotation, long a cherished dream of farm management authorities, is now an accomplished fact on many farms. The electric fence has made it practical. By studying farm needs and writing specifications to fill those needs, G.L.F. has developed an electric fence controller that is inexpensive, easy to set up, and perfectly safe when correctly installed. Temporary electric fences can be put up quickly and moved easily to keep grazing under control throughout the season. For farms that **do not have** electricity, battery controllers are available.

COOPERATIVE G.L.F. EXCHANGE, INC. . . . ITHACA, N. Y.

Never too old First man to order grass seed from Beam Milling Co., G.L.F. Service Agency at Geneseo, this year was Mr. C. D. Neff, who at 90 still actively plans and supervises the work on his 120-acre farm. Mr. Neff retired from the coal and lumber business a few years ago, but retained supervision of his farm which is planted to oats, beans, and alfalfa. Last year was the first time he used G.L.F. grass seed; this year he came back for more. Mr. Neff recalls that the common crops in the Genesee Valley in his boyhood were wheat and barley. Practically no alfalfa was grown at that time, while today it is one of the most important crops in that area.

Anccestor

This tintype, taken about 1890, shows Jeremiah Clarke, early Allegany County Holstein breeder, with one of his prize bulls. The traditions of herd improvement were handed by Jeremiah to his son, E. E. Clarke, and to his grandson, Carl (see below). Carl takes an active interest in G.L.F. as a committeeman of Whitesville Cooperative G.L.F. Service. He has been a member of the Cow Testing Association for 11 years. For the past 4 years, his herd has averaged over 500 lbs. of butterfat. He raises mixed hay and matches it with 20% Super Exchange Dairy for his milking herd.

Great cow 104,557 lbs. milk, 3,452 lbs. butterfat in 5 lactations and 189 days of her sixth, is the record to date of Hill-view Butter Girl Colanthe, shown here with her owner, Carl V. Clarke of Andover, N. Y. Mr. Clarke's grandfather, Jeremiah Clarke, imported some of the early Holsteins to that part of the country. Many of the Holstein herds in Allegany County are descendants of his imported stock.

THE FARM PAPER OF THE NORTHEAST

A Crusader for COOPERATION

*A Priest on Snowshoes Leads
New Cooperative Developments
in Northern Maine*

BETWEEN the big woods of northern Maine and the famed Aroostook potato county, only a few miles from the Canadian border, lie two small settlements known as Sinclair and Guerette. To serve these two French-speaking communities there came in 1936 a young Catholic priest, the Reverend D. Wilfred Soucy. His return to his native northern Aroostook County marked the beginning of a new chapter in cooperation in that part of Maine.

With one encouraging example after another of constructive accomplishment through cooperative action, that chapter is unfolding. In three years with Father Soucy's energetic leadership and their own efforts, the French-speaking farm people in northern Aroostook have made more progress in getting needed services cooperatively than in any like period in their history.

Six credit unions, a cooperative creamery, a cooperative breeding association for dairy-men, and a new homecraft project which will provide part-time work for hundreds of residents of the area—all have come into being since Father Soucy began preaching the gospel of cooperation in northern Aroostook. He would be the last person to take credit for bringing these organizations to life. But few who know the area believe that any one of these new cooperatives would now be operating had it not been for his ceaseless efforts. And it is Father Soucy who properly receives as many as 200 letters a day thanking him for his leadership in the handicraft project alone.

Father Soucy cannot disclaim credit for many other marks of progress that the last three years have recorded in his own parishes. When he went into Sinclair and Guerette there was no road connecting the two communities, although they are only about 6 miles apart as the crow flies. In winter, which is a good part of the year up there, Father Soucy had to go as much as 43 miles to get from one town to the other, unless he struck off across country on snowshoes, as he frequently did. A considerable part of his people were with-

By **BRUCE B. MINER.**

out telephone service. They had no electric lights.

Snowshoeing across this frozen north country, Father Soucy could not help thinking of the sad paradox that confronted his people. On one hand they were without many of the modern conveniences of life. On the other hand, many of them were without work. And, he reasoned, they could with some assistance be providing for themselves the very things they so badly needed.

The road came first.

With money being spent on public works and highways throughout the country, Father Soucy could see no reason why public funds should not be made available for a road from Sinclair to Guerette. He had friends, and they had friends, and before long there was \$160,000 set aside for the long-needed highway. A few months later there was the road itself, and now others are being built in the vicinity. For, as Father Soucy says, "When we once start a project we must keep working at it unceasingly if it is to succeed. We cannot afford to stop arguing until we get what we are surely entitled to."

The telephone company was the next to come up against the dogged tenacity of the economic crusader. Father Soucy tried to get action from the local telephone company, but they politely found innumerable reasons for delay in actually building a line. One day he came across a particularly glowing advertisement setting forth the wonderful service of the telephone company. With that as his text, Father Soucy wrote a skillfully planned letter to the company's offices in Bangor. It was nice, he said, to have telephone service, day and night, through storm and fair weather, from coast to coast. But here in the company's own territory was a community without a single telephone with which to summon a doc-

The Reverend D. Wilfred Soucy, right, of Sinclair, Maine, with Hubert Tracy, Assistant County Agent in Aroostook County. They are holding a cup presented to Father Soucy by cooperatives he helped to organize.

tor or priest. What did the telephone company propose to do about it?

The telephone company put in the line, but Father Soucy arranged to have his parishioners cut the poles themselves. A part of the line goes under a lake. Progress seemed slow and a Maine winter doesn't wait for holidays. Finally, the cable was laid under water on the eve of Thanksgiving day in 1938, and the lake froze over on the holiday. Twenty-four hours delay would have meant another winter without telephones.

Electricity came into Sinclair, Daigle and a part of St. Agatha after another campaign in which Father Soucy took (Turn to Page 8)

A Program for Junior Vegetable Growers

SIX YEARS ago the Vegetable Growers' Association of America started a junior section as part of their annual convention program. The results in participation of the young folks have been unusual, and last fall in Chicago the boys and girls organized the Junior Vegetable Growers' Association of America. Officers elected were: Aubert Johnson of Binghamton, N. Y., President; Arthur Doust of Berlin Heights, Ohio, Vice-President; and Harvey Billings of Cummington, Mass., Secretary-Treasurer.

This summer from August 26 through August 29 this organization of young vegetable growers will have their 1940 meeting at Philadelphia. Any boy or girl between the ages of 12 and 21 is invited to attend.

Professor Grant Snyder of the Massachusetts College of Agriculture at Amherst, who is Chairman of the Advisory Committee for the Association, has been much interested in this junior organization and has given a lot of encouragement and help to the boys and girls. If you are interested in going to Philadelphia, drop Professor Grant Snyder a post card for a program and details about the contest.

The Future of Northeastern Apples

Faced with unprofitable and discouraging seasons, apple growers of the Northeast naturally wonder about the future. Is it worthwhile to plant new trees, or even to take care of the old ones?

One partial answer to this question was given by A. J. Heinicke, Professor in Pomology at Cornell University, in an excellent talk. Professor Heinicke, after a visit to the intensive fruit regions of our Northwest, says:

"There has been a gradual decrease in the number of bearing trees in the Northwest since 1920. In 1935 there were only 58 per cent as many bearing apple trees as in 1920, and at present probably only half as many. Such Western fruit growing regions as Spokane, Walla Walla, the original Hood River section in Oregon, and many smaller scattered sections throughout the state of Washington, have been largely abandoned. . . . In all likelihood the peak of production of the Northwest apple crop has been reached. . . .

"I think I can safely say that many growers in the Northwest envy the situation of the fruit grower in the Northeast. There is no doubt that the Northwest orchardist can grow good fruit, but he is definitely handicapped in selling his product with the enormous distance from the markets. The growers have taxed themselves to carry on intensive advertising campaigns, and nothing will be left undone in the attempt to keep the fruit industry on its feet. Our competition in the future will not be so much with apples produced in the Northwest as with the enormous amount of citrus fruits and canned fruit juices that are produced in other sections of the country. . . .

"With high quality like the McIntosh as the backbone of the apple industry, and with the markets near at hand, we seem to be in a rather favored position to meet competition from other sections."

Grange Highway Safety Contest

Grange members under 18 years of age have an opportunity to compete for worth-while prizes in the 1940 National Grange Safety Essay Contest. The winner in each state will receive \$10 and a silver medal; while the big prize to shoot at is first in the national competition, which will bring a trip to National Grange at Syracuse next fall with all expenses paid, where the winner will be awarded a gold watch.

Ask the Lecturer of your Grange for full details, or write to Stephen James, Highway Education Board, Pan American Building, Washington, D. C.

"It Saved My Herd"

Says Dairyman Harold Creal

By H. L. COSLINE

▼ Vaccinating a heifer with "Strain 19"

SEVEN YEARS ago dairyman Harold Creal of Homer, Cortland County, New York, had a real battle on his hands. The technical name of his enemy was "Brucella Abortus"—a "bug" so small that it cannot be seen with the naked eye. But he could see the results—a storm of Bang abortion in his herd of 75 cows—without half trying.

"The situation was acute," says Mr. Creal. "It was a question of licking abortion or having it lick me."

Let's go back to the year 1930. In June the herd was TB tested, and when the smoke cleared away, the entire herd of 74 animals was on its way to the butcher. After the premises had been cleaned up, Mr. Creal proceeded to buy a herd of milkers. Up to that time, Bang abortion had given him little trouble, and anyway animals blood tested for abortion were scarce. He went into western New York areas that were modified accredited and bought some good grade cows that were TB tested. Some of them were fresh; some were due to freshen soon and did freshen with no abortion.

"But the next season," said Mr. Creal, "brought another story. A storm of abortion broke out, and the next two years added plenty of gray hairs to my head."

"First I tried to handle the situation by blood testing and dividing the herd into two groups—one clean herd and one herd of reactors. Dr. Birch of the State Veterinary College worked with me and with Dr. McAuliff of Cortland. The herd was blood tested every two months, but in spite of all the precautions we could take, our cows continu-

ed to abort. Because I had plenty of room and plenty of help, I was raising my own replacements. I feel that is the only practical way to build up a herd of high producers.

"About 60 per cent of my first calf heifers aborted. A few would abort the second time, and one aborted three times in succession. In general, the older cows seemed to build up an immunity. Even so my losses were terrific. I know that many clean herds have been built up by the two-herd method of segregating the reactors to the blood test in a separate barn, but certainly it wasn't working in my case; and I began to wonder whether there wasn't some other solution. I was in the frame of mind to try anything, and when I began to hear about the possibilities of calfhod vaccination, I went at it."

"In what year did you start vaccinating?" I asked.

"That was in 1934," Harold replied. "Both Dr. McAuliff and Dr. Moore, who were my veterinarians, believed the plan had some possibilities. Of course, there was less information about calfhod vaccination than there is now, and we did a few things, such as vaccinating a few mature cows, that I wouldn't do now. The important point was that we did vaccinate every calf between the ages of six and eight months. Doubtless scientists wouldn't be satisfied that my experience is conclusive evidence of the value of our program, but I can say this. In the past six years, just four cows out of my entire herd, that were vaccinated when they were calves, have aborted. A total of 150 calves have been vaccinated."

"During the peak of our trouble with

Harold Creal of Homer, N. Y., is known to his friends as "Cap"

abortion, it took 18 or 20 heifers a year to maintain the herd. I have always felt it was good business to have a veterinarian keep an eye on the herd and he always gave attention to the animals difficult to breed. In spite of that fact, we had to sell plenty of non-breeders. Just by way of comparison, take 1939, when I had 17 heifers that freshened, and I only needed 9 of them to replace mature cows that I had culled out. For some years I have been working toward a purebred herd, so I was able to sell 9 mature grade cows to dairymen instead of sending them to the butcher. I aim to continue to raise from 18 to 20 heifers a year and to add to the farm income by a few sales."

"Have you blood tested since you began vaccinating?" I inquired.

"No, I haven't," said Harold. "In a way I would be interested to know what a test would show, but right now I can see no real reason for going to the expense of a blood test. In a few years all of the animals in the herd will be purebred, and if I find it necessary to blood test them in order to make sales, I will do it. However, it may be when that time comes that the program of calfhod vaccination will have developed to a point where it is generally recognized by dairymen and by state and federal disease control officials."

All of the evidence to date indicates that animals vaccinated as calves have

some money for free blood tests for dairy herds not enrolled in the federal-state test and slaughter program. Because of the emphasis on economy, the bill was killed in the Ways and Means Committee.

"It is my feeling," said Mr. Creal, "that such a program would be worth while. It would give a good many dairymen a chance to find out the exact situation in their herds. Undoubtedly there are a good many clean herds that have never been blood tested, and a man is inviting disaster when he buys an untested animal to put in such a herd. Furthermore, the veterinarians all advise a blood test on a herd before a program of calfhod vaccination is started. The first step in any disease eradication program is to know from where you are starting."

"Personally, I would like to see some plan adopted for state supervised vaccinated herds and a provision whereby dairymen now enrolled in the federal-state test and slaughter program could vaccinate calves. Federal and state officials have objected to this. When mature animals are vaccinated, they will react to a blood test; and some

The cow may feel badly over this result of Bang's Disease, but not half so bad as do the thousands of dairymen who suffer tremendous and ruinous losses. That's the reason for the growing interest in calfhod vaccination.

an excellent chance to test negative on a blood test by the time they get to producing age. That fact permits a dairyman to practice calfhod vaccination with a badly infected herd and gradually they will give a negative reaction to the blood test.

In addition to being a dairyman, Mr. Creal has served two terms as State Assemblyman and so has been able to look at the problem of eradicating Bang abortion from both sides of the fence. Says he:

"It cost New York State \$50,000,000 to get rid of bovine TB. Probably it would cost us at least as much, by the test and slaughter method, to eradicate Bang abortion. Frankly, with present conditions, I can't see where we are going to get that much money."

Last winter Mr. Creal introduced a bill in the State Legislature to provide

dairymen might use vaccine in an attempt to sell reactors to the state. However, since the law now provides that calves can be vaccinated only by qualified veterinarians who must make a full report to the state of all animals vaccinated, I think this angle can be handled."

Mr. Creal's experience has sold him on the value of calfhod vaccination. When you consider that 60 per cent of his first calf heifers aborted before starting the vaccinating and that trouble from this source is practically non-existent now, you can hardly blame him for that conclusion. Skeptics will naturally say that it takes more than one swallow to make a summer, but I have yet to find a dairyman vaccinating who is not distinctly encouraged by the results from it. At any rate,

(Continued on Page 6)

Experience Wanted

We are interested in passing on to our readers experiences of men who have tried out calfhod vaccination to control Bang Abortion. Tell us how long you have been vaccinating calves, what your experience was before vaccinating, and how vaccination has worked out in your herd. Add any personal comments you think would be of value, but keep your letter short.

American Agriculturist will pay \$1.00 for each such letter we print. Address: American Agriculturist, P. O. Box 367-V, Ithaca, New York.

"UNLUCKY AS A FIFTH CALF!"

—Old Country Saying.

A Living Price for Milk

DURING the month of March, 1939, the average price for milk to dairymen in the New York City milk shed was \$1.43. For March this spring it was \$1.98, or a gain of 55c a hundred pounds. Multiply this by 475,500,000 pounds, the approximate amount of milk shipped to the New York market, and it gives \$2,614,000 more money to dairymen in the New York market this March than during the same period last year.

For April the story is an even better one. The April price in 1939 averaged \$1.14, for this year \$1.86, a difference of 72c. Multiply this by the amount of milk shipped to New York market in April and you have \$3,747,000 more money in the pockets of dairymen for the month of April alone. Add the increases for both March and April for this year as against last year and you have well over \$6,000,000 more money, the difference between daylight and dark, the difference between living or just staying and working for nothing on these dairy farms.

Let us bring those figures down in terms of the income for an average dairyman. Suppose a man has 10 cows that produce at the rate of 6,000 pounds of milk a year, or 60,000 pounds for his herd. That is at the rate of 5,000 pounds of milk per month. For March of this year that dairyman was \$27.50 ahead of March last year, and for April of this year over last he was \$36 ahead. If he had more cows, or if their average was better, his increase of course would be larger.

Attention of business men is also called to these figures, for they mean more and better business for everybody.

American Agriculturist helped to get these better prices and we are proud of what we did. The prices are the result of just two factors:

1. Better organization of dairymen themselves, and the union of these organizations in the Metropolitan Bargaining Agency.
2. The Federal-State marketing agreements.

For years we of *American Agriculturist* have worked almost night and day to get dairymen organized and federated. We left no stone unturned to urge dairymen to vote for and support the marketing agreements. Result: better prices and better times for everybody concerned.

But the milk marketing problem of course is not all solved. Prices must be maintained. That means continued support of both organization and the marketing agreements, with such modifications of the agreements as from time to time seem necessary to suit changing conditions. I suggest two things to think about immediately:

1. Why not have one Federal marketing agreement covering all of the markets of the entire Northeast, with modifications, of course, to fit the conditions in the different markets? That would eliminate price-cutting and market wrecking in every one of these northeastern markets.
2. The second and more important suggestion is that dairymen must find some way to control production. The better prices are resulting in the large production of milk in many years.

There can be but one end to that, and that is much lower prices, unless the supply is cut down somewhat. One way to help is to use more milk and dairy products. Something else to think about is some kind of a production quota for every dairyman. What do you think about it?

Wrong Emphasis

DISCUSSING the Farm Credit situation, my friend Cliff Gregory, Associate Publisher of the Wisconsin Agriculturist, tells of an interesting remark made to him some time ago by a farmer friend. Said this farmer:

"Well, the ability to borrow money is important, but the ability to pay it back is far more important."

I wonder why so many people lately have lost sight of this fundamental truth. No one is ever helped by too easy credit. About half of Northeastern farmers have no mortgage, but they, with the rest of the citizens, have to pay in taxes when interest rates are reduced by the government so low that the government itself has to make up the difference out of the Treasury.

In the second place, the proposed reduction of $\frac{1}{2}\%$ in an interest rate on an average mortgage of \$3,000 would mean only \$15 a year to the individual farmer. Now, of course \$15 is important, but if a tenth of the same amount of thought and energy that is put on such schemes as reducing production and cutting interest rates were turned upon the effort to help improve marketing conditions and raise the price level to farmers, it would give farmers some real help. For example, through the marketing agreements and by good dairy organization we have been able to increase the price of milk by more than 50 cents a hundred over what it was last year. Even a small dairyman with 10 cows produces 50,000 pounds of milk a year. Multiply this by the additional 50 cents a hundred and he has \$250 more than he had last year. Now, compare this \$250 for the work on the constructive side with the \$15 saving on the peanut side, and you see what I mean. I'd make the \$15 saving too if I could, but I'd be darn sure that I was not wasting my time and energy on \$15 when I might be making \$250 by more constructive forward-looking marketing policies.

And, also, speaking of Farm Credit, I'd be sure, if I were a farmer borrower, that I was not selling a lot of power to the government and my freedom to carry on my own business for \$15. That's the reason why almost all of the farm organizations of America, and all others who have been familiar with the good work of the Farm Credit Administration, have vigorously fought the Jones Bill, which would do away with the cooperative principles of Farm Credit and centralize its complete administration in the Department of Agriculture. As a result of this fight, the Jones Bill will not pass.

Taxes the Great Problem in Maine

IN AN informative and interesting talk given recently during Farm and Home Week at Orono, Maine, Mr. E. H. Thomson, President of the Federal Land Bank at Springfield, Massachusetts, emphasized among other things the problem of taxes on Maine farms.

"A study made by the University of Maine," said Mr. Thomson, "showed that 76.3 per cent of the taxes paid by farmers were general property taxes. This same study of taxes and income on 422 widely scattered Maine farms showed that for farms with an income of less than \$1,000, taxes represented nearly 21 per cent of the farm income. For farms with incomes ranging from \$2,000 to \$6,000, taxes averaged 11 per cent of the income Estimated real estate taxes per farm in Maine in 1938 were \$87.91, and there are some farmers in Maine who pay a tax as high as \$80 a thousand. Think of that! The average Federal Land Bank loan outstanding in the state was \$2,140; in other words, the annual real estate taxes per farm represented

"The world stands out on either side
No wider than the heart is wide.
The heart can push the sea and land
Farther away on either hand.
The soul can split the sky in two
And let the face of God shine through."

—Edna St. Vincent Millay.

4.1 per cent of the loan, or a sum greater than the amount of interest paid by the farmer on the average Federal Land Bank loan in the state."

While Maine farmers are particularly hard hit by taxes, farmers everywhere have much of the same problem. It illustrates again the point *American Agriculturist* has emphasized many times, and that is that we are over-burdened by too much government service, far more than we can pay for. *The best way for government to help farmers is to cut its activities. One thing that we need is more self-contained farmers, more self-sufficient farms.*

I said this to a friend recently, and he said: "Yes, but remember that we have got to plow the roads and we have got to buy gasoline."

To which I answered:

"Yes, but surely we can raise more of the products consumed by our own families, we could get along with a little less gas, with fewer frills called public service, with lower salaries of public officials, and a darn sight fewer of them."

A Standard Pack for Apples

APPLÉ growers of the Northeast have had various conferences this spring in an effort to standardize marketing packages for apples. As a result, there seems to be an agreement on a 1 1/16 bushel basket and a 1 1/8 bushel box.

That is progress! I don't know what the exact size of the package should be, but whatever it is, it should be standard. Northeast growers made progress when they stopped putting their apples in barrels. Now with a constructive standardized pack, and with the quality of apple which we can produce in this section, our growers ought to top the market all the time.

Railroads Heavy Taxpayers

RAILROAD taxes in 1939 represented 37.7 per cent of the net operating income before the taxes were deducted. Railroads, next to farms, are the most heavily taxed. Farmers are the heaviest users of railroads, therefore farmers not only pay direct taxes heavier than anyone else, but they also pay the largest share of the railroad taxes.

Do You Want a Job?

WE ARE overwhelmed by requests from farmers for hired men, both for single and married men. If interested, write immediately giving full particulars to *American Agriculturist*, Department F, Savings Bank Building, Ithaca, New York.

Eastman's Chestnut

COUNSEL (cross-examining a farmer): "Now, don't quibble! Do you understand a simple problem or not?"

Witness: "I do."

Counsel: "Then, tell the court this: If 15 men plowed a field in 5 hours, how long will 30 men take to plow the same field?"

Witness: "They couldn't do it."

Counsel: "Why not?"

Witness: "Because the 15 men have already plowed it!"

Mr. Secretary, Why Was Harmon Removed?

ON MAY 28, 1940, E. M. Harmon, Federal Administrator of the milk marketing agreement in the New York milk shed, was removed from office by Secretary Wallace, and Mr. N. J. Cladakis, Administrator of the Chicago milk marketing agreement, was substituted. (For details, see Page 6).

Mr. Cladakis has the reputation of being an able and successful administrator, and as such will have our support. That is not the point. We understand that Mr. Harmon will return to an important position in the Department of Agriculture. That's not the point either. The point is that the removal of Mr. Harmon was done without consulting dairymen, and even without their knowledge. Dairymen want and have a right to know why this was done. It is reported as a straight political move, a sop to Mayor LaGuardia of New York City, who is said to have no love for Mr. Harmon. Is that the reason? The Mayor has been sticking his nose into the milk business, to the detriment of dairymen. His latest move was the establishment of new Board of Health rules doing away with Grade A milk and putting increased costly regulations on dairymen in producing Grade B.

The removal of Mr. Harmon by Secretary Wallace is another act in the long chain of exercise of arbitrary and centralized powers of Wallace and the Department of Agriculture. Leaders in the Department give lip service to Democracy, but in practice many of the acts are as autocratic as those of a dictator.

The whole success on a permanent basis of the milk marketing agreements rests on the principle of full cooperation between the farmers and their cooperatives on one side, and the State and Federal departments of agriculture on the other. If the Department of Agriculture is to dominate and control the entire program, then eventually politics and bureaucracy will ruin the present milk marketing plan. Under Mr. Harmon's administration, there was the utmost cooperation. He was well liked by dairymen, and was an efficient administrator in every respect. Why was he removed, Mr. Secretary?

Those Who Would Live By the Sword—

ON MY desk as I write are some tulips, given me by Curry Weatherby, Treasurer of *American Agriculturist*. Curry's son Jack brought the tulip bulbs back from Holland when he was over there three years ago on a Boy Scout Jamboree.

Every time I look at those tulips, the picture comes to me of Holland, Land of tulips, dairy cows, and windmills, and I wonder if I am really awake or dreaming a horrible nightmare. Here only a few weeks ago were Holland, Denmark, Norway, and Belgium, inhabited mostly by farm folks, whose only offense was a desire to keep the peace. Today their cities are in ruins, their crops and their cattle gone to feed the enemy, and their people homeless, with thousands of them dead or wounded.

Is this our boasted civilization? Is it true that the only real thing science and mechanics have done for us is to destroy us? I cannot believe it!

There are and always have been two gigantic antagonistic forces in the world. Call them what you may—God and the Devil, Pagan and Christian, Might and Right—one is always Evil and the other always Good. These contending forces are in Nature itself. Watch a hurricane, a flood, or a great forest fire, and behold Evil at work; or look at the new green earth and its blossoms in this June time in our great North Land, and see Goodness in Nature. Evil and Good contend in You, and because they are in every man, they are also in every man-made institution, be it business organization or nation.

As I write, Evil is on the rampage in Europe, and riding to apparent victory. For the moment, Goodness seems to be overwhelmed; stricken men and women throw their arms to Heaven and shout: "Oh Christ! Where art thou?" "Oh, God, if there be a God, save us now!" But God for

the moment apparently turns his face, and Evil rushes on and on.

But wait! Progress, real progress, real civilization, is long in the making. The perspective of history shows that progress, or truth, while painfully slow, and sometimes gained at the cost of pain, sacrifice and blood, always eventually marches on. To God a thousand years is but a day. Down the long years since man emerged from the mud, Truth and Goodness have never failed. Even for those who die there are things worse than death—one is slavery to Evil. Might never has and never can permanently prevail. "Those who live by the sword eventually shall perish by it."

So in this dark hour look to history for comfort. Keep up the good fight against Evil in your own lives, in your community, and in your nation, and above all, keep the faith in the ultimate Good.

Hired Men Have Their Side Too

"Will you kindly consider my remarks regarding the home of the tenant man. At least twice a year the health officer or the veterinarian comes to our farm. He is rather careful in scoring up the cow barns and cows for the benefit of the health of the public, but who is there that shows any consideration for the condition of the tenant house? Farmers complain that they cannot get good tenants for hired men any more. The reason is that wages are too poor and the living conditions for the hired man and his family are too often not very good."—K., N. Y.

I ANSWERED this man that I felt most farmers would pay better wages and provide better tenant houses if they could get the money with which to do it. Everyone knows how ruinously low the farm income has been for many years now.

On the other hand, the farmer-employer must recognize the cold fact that he has to compete with other business for his help, and that the hired man has a perfect right to go where he can get the best conditions.

So far as the tenant house is concerned, there are some things that can be done by the employer and his hired man to make the lot of the tenant and his family more comfortable and happier which would not cost much money. What is needed often is more real thought, consideration, and cooperation on the problem.

Success in Fighting Bangs

ON PAGE 3 of this issue is one of the most important articles that has been in *American Agriculturist* in years from the standpoint of dairymen. It tells the story of several years' experience of a dairyman in controlling Bang's Disease. It begins to look as if a method has

"A boy's will is the wind's will
And the thoughts of youth are long, long thoughts!"

"No nation has ever achieved permanent greatness unless this greatness was based on the well-being of the great farmer class, the men who live on the soil; for it is upon their welfare, material and moral, that the welfare of the rest of the nation ultimately rests. . . ."

—Theodore Roosevelt.

been found to save dairymen from the ruinous losses that they have suffered from this terrible scourge.

"Down the Alley"

AMERICAN AGRICULTURIST prides itself on its contributors who write from actual experience. Among these is Doc Roberts, with his "Down the Alley" piece in every issue (see Page 15). No man in America is closer to livestock or saner in his comments about it than Doc Roberts. Note particularly this time what he says about getting in shape to produce livestock products for the millions across the seas now engaged in destruction rather than production.

Readers Talk Back

"After reading your story of a Northeast Journey in last issue it brought back so many memories that I had to write you. Even the 'no syrup' on the first, second and third pancakes is one of my earliest recollections and the custom has been passed on to my own children. I had always had a sneaking suspicion it was because there were 8 of us children and it was a case of saving on the syrup. My mother, who was 82 years old on May 24, is with me, so I told her about what you had written and asked her why she had always had us take the first pancakes without any syrup. She said that it was better for us. So you see 'good nutrition' was practiced if not taught then. The nutritionists today admit that pancakes have their place in the sun, but not to the exclusion of good whole grain cereals. . . . You mention so many places in Vermont that we could see from our porch on the homestead, located high on a hill across Lake Champlain at Crown Point, that it made me homesick."—A.P.D., New York.

"Just read your editorial about 'fool time.' Until this year I disliked the change in clocks as much as anyone, but now I have decided to do what the majority seems to want."

"Really, all the farmers I know get up an hour earlier in summer than in winter, and if they would change their clocks, they could do this and still keep on the same schedule. I am a teacher and know some of the children who come from homes like the one quoted. They get up at 4 o'clock so the children can do most of the day's work before time to start for school. Believe me, Mr. Editor, that's no way to help children do their school work! These children come in so tired that they go to sleep during classes. Daylight Saving time is not to blame, but the parent is who expects a child to do a man's work and come to school just because the law says he must."—N. C., New York.

EDITOR'S NOTE: There may be some cases of this kind, but it seems to me to be inconsistent to blame sleepy children on the parents instead of on Daylight Saving.

"I would say keep on with your Northeastern Slants, but I was much interested in your story of the trip to New England. I have been through some of these beautiful places myself. I was 70 years old last year. After plowing and sowing my buckwheat and oats I drove my tractor 800 miles. My sons are all away from home. I used to sing. Now I wander around the farm all alone."—E. J. O., N. Y.

EDITOR'S NOTE: Thousands of parents know how this father feels. I know! But it is the way of life, and the way that it should be. Our job is to keep up our own interests and our own philosophy and be happy just the same.

"I am sorry you are discontinuing Slants. Nothing else can take its place for me."—M. L. S., N. Y.

"We need Slants more than ever now, you know."—W. M. B., N. H.

"I feel that it would be a great loss to busy farmers and others who depend on Slants for a quick summary of the news."—A. E. D., N. Y.

EDITOR'S NOTE: Well, what do you think? I like to have readers dictate the policies of *American Agriculturist*. The trouble is to find out what you want. If enough of you report that you want Slants put back in the paper, they will be.

N. J. CLADAKIS Replaces Administrator Harmon

EFFECTIVE May 28, Milk Marketing Administrator E. M. Harmon was recalled to the U. S. Department of Agriculture at Washington. Appointed in his place is N. J. Cladakis, who has been serving as Administrator of the Milk Marketing Agreement in Chicago.

The news came as a distinct surprise to most dairymen in the Metropolitan area. When it was announced, delegates of the Metropolitan Cooperative Milk Producers' Bargaining Agency were in session in Syracuse. They immediately passed a resolution to investigate the removal of Mr. Harmon and laid plans to give a testimonial dinner to him as an expression of the thanks for the part he has played in the successful operation of the Order.

In part the resolution read:

"As representative of 50,000 dairy farmers depending on the honest and equitable administration of the Milk Orders for a continued market of stability and living prices, we view with alarm any change in this position, without in any way questioning the ability of the proposed successor."

We might add that we hear excellent reports of Mr. Cladakis's ability, although the Chicago Order has not been functioning as long as has the one in the Metropolitan area. His place as Administrator in the Chicago market will be taken by A. W. Colebank. Mr. Harmon has been Administrator of the New York City Order since it first went into effect in the fall of 1938, and has made many friends by his fairness and by his able work.

No reason was given for the change. The official announcement by Secretary Wallace stated: "Following a conference between Secretary of Agriculture Henry A. Wallace and Commissioner H. V. Noyes of the State Department of Agriculture and Markets, the Department of Agriculture announced that N. J. Cladakis, Federal Milk Marketing Administrator in Chicago, will be transferred to New York as Market Administrator, effective May 28."

Mr. Harmon, it is announced, will return to Washington to assume impor-

**N. J. Cladakis.**

tant special duties with the Dairy Section of the Division of Marketing and Marketing Agreements.

Gossip around the Milk Shed gives chief credit for the change to Mayor LaGuardia, who has been disgruntled since his activities as arbitrator in last summer's milk strike did not turn out in exact accordance with his expectations. Since that time LaGuardia has been "on the outs" with Secretary Wallace and Administrator Harmon, and the removal of Mr. Harmon is considered by many as a move toward appeasing New York's fiery Mayor.

Price Revision Request Considered

Among matters considered at the meeting of the Bargaining Agency in Syracuse was a proposal to petition the state and federal departments of agriculture for a hearing on the revision of price of fluid milk for August, September, and October. Homer Rolfe of Lisbon made a report of the Committee appointed to consider a possible production control plan for the New York Milk Shed.

"It Saved My Herd" (Continued from Page 3)

American Agriculturist is definitely stating that in the light of evidence at hand, calfhoo vaccination has distinct possibilities and is worthy of the serious consideration of any dairyman who is having trouble with abortion.

When you consider calfhoo vaccination, keep these things in mind—they are important:

1. Vaccinate calves between the ages of six and eight months. Vaccination at a very early age is likely to be ineffective, and vaccination at an older age may cause the animal to continue to react to the blood test and perhaps spread the disease.

2. Let a qualified veterinarian do the actual vaccinating. There are several reasons for this. Among them is the fact that you will need a veterinarian's advice on your general herd program, and his counsel may prevent some costly errors.

3. Use the vaccine "strain 19" only.

4. A blood test for Bang abortion should be applied to the entire herd before any calves are vaccinated. That tells you exactly how your herd stands. If your herd should give a clean test, you will be able to avoid trouble by adding only clean animals to the herd; and you will be quite likely to decide that so long as you have no trouble, it would be unwise to start the vaccination program.

5. Get all of the information you can

about Bang abortion and about calfhoo vaccination.

If future experiments and practical experience back up the evidence we already have in favor of calfhoo vaccination, it will be a great day for dairymen. It will save millions of dollars for the state and federal governments, and it will save millions for dairymen, at the same time allowing them to work out a definite breeding program without the heartbreaking experience of seeing some of their best cows go to the butcher.

Dairy Field Days

Three Regional Dairy Field Days are scheduled for this summer. First on the list is for the South-Central area, including the counties of Broome, Chemung, Chenango, Cortland, Delaware, Otsego, Tioga, and Tompkins, to be held June 8 at Norwich Fair Grounds. The Central New York Dairy Field Day will be held on July 26-27 at the State Fair Grounds at Syracuse.

For Western New York the place is the Angelica Fair Grounds in Allegany County and the date is July 27.

At each of the Field Days there will be an interesting and instructive program, but perhaps the principal idea is to interest dairymen in better sires and give them an opportunity to make purchases. These bulls are not sold at auction but are sold at private sale between owner and buyer.

FAST GROWTH to get **BIG PULLETS** that lay **BIG EGGS....**

IS IT HARMFUL or desirable to grow a pullet for early egg production? That's the question many poultryraisers ask themselves during the pullet growing season.

Poultry research work during the last few years has answered this question in no uncertain terms. It is summed up in a statement made recently by Dr. H. J. Smith, Director of Research of Purina Mills. He says:

"Progress in breeding has shortened the period necessary for a pullet to arrive at egg-laying maturity. That means breeders have done much to shorten the period of waiting before egg production begins. It is our responsibility as specialists in nutrition to build rations that will help shorten the period necessary for physical maturity."

By having pullets ready for early production, it is possible to get past the pullet egg stage earlier, and be ready to take advantage of high fall egg prices. Big eggs are usually worth from 8 to 10 cents more in the fall than pullet or "pee-wee" eggs.

You'll find no better way of growing your pullets for complete early development than the Purina way. Purina Growena, the complete feed, furnishes everything a pullet needs for full complete development. If you prefer the mash and grain plan, feed Purina Growing Chow with your scratch grain. This plan also gives good results. See your Purina dealer for full details of the Purina Pullet Growing Plan.

I DARE YOU!

PART II

Sightseeing in Hawaii

PARADISE is the place where we expect to go when we die. Take down your atlas. Put your finger on the Hawaiian Islands. Here is Paradise on earth. When you knock on the pearly gates, if St. Peter won't let you in, then return to this Paradise, a part of our own America.

Days are all too short in Hawaii. To save and gain time we decided to fly over the seven major Islands of the Hawaiian group. Taking off from Honolulu, on the Island of OAHU, we flew in a large Inter-Island airplane over MOLOKAI, where Father Damien gave his life in service to the lepers; then to our right LANAI, the luxuriant pineapple island, from which the Pineapple Packing Companies put into cans the luscious fruit that comes to our table; then MAUI, looking down into the ten-thousand-foot crater of HALEAKALA, big enough to hold St. Louis and all its suburbs; then to the Island of HAWAII, with its snow-capped MAUNA KEA rising in the distance. The blue of the sea, the white surf beating on the lava rock shores, sluices filled with rushing water, carrying cut sugar cane from the fields down to the sugar mills, and the red and green roofs of the plantation houses, dotted like mosaic checkerboards all exhaust our "ahs" and "ohs" until we have no language left to describe the beauty of these Islands.

Finally, beneath its lofty coconut palms, we came to lovely Hilo. As we landed we were greeted by old friends, Dr. and Mrs. Henry B. Yuen (who was Thelma Stephenson, one of our former Purina girls). Doctor Yuen declared a holiday in our honor, and he and Thelma gave us two of the loveliest days we have ever experienced, driving us more than two hundred miles around winding roads that skirted the Island of Hawaii.

BEFORE our drive I had an experience I won't soon forget. I spoke at an Intermediate School to twelve hundred boys and girls. Only about one-third could get into the auditorium, but a new sound system was installed just that very day, and the other two-thirds heard me in their classrooms as I spoke before a microphone in the main auditorium. It was a thrill for me as I looked into that sea of brown, eager faces. I was introduced by a Ceylonese girl, Noda Lee. Her beautiful English assured me of a warm welcome. In a halting way I told the meaning of our Four-Square program. Then at the end I asked Noda to help me impress these thoughts on the boys and girls by actually having them take part with us. Now imagine these twelve hundred alert faces doing this:

"All straighten up and say, 'Stand Tall.' Now with your right forefinger pointing to your head, say, 'Think Tall.' And all together in your graceful Hawaiian way, with each hand sweep up the corners of your mouth and say, 'Smile Tall.' Last, lift both arms high over your head, with your fingers pointing upward, and say 'Live Tall.'"

Then I gave Noda a little knife with that motto on one side and the Four-Square Checkers on the other, and, with hand clapping and shouting, an "Aloha" was sent back to all of you on the mainland.

AT the end of our first day's journey we stayed at the Kona Inn at KAILUA and saw the original church started in 1820 by our first Congregational missionaries. It has a beautiful name: "MOKUAKAU" — Let us be brotherly. This church stands today as a challenging example of the Christian faith of our forefathers.

Our first day's drive was through and around sugar plantations, which revealed a splendid example of community life in which a house is given to each family rent and fuel free. Schools, recreation grounds, medical attention are all provided at each plantation center, and a steady daily wage guaranteed the year around. We also passed the Parker Ranch which, next to the King Ranch in Texas, is the largest in the world.

Our second day on the other side of Hawaii was very different. Here are coffee groves where the famous Kona variety is raised. And there are miles and miles of weird lava formations from the many eruptions of MAUNA LOA (13,675 feet high) as the hot streams flowed from the crater to the sea. A great National Park of thousands of acres has been set apart by our Government. It takes in the scenic wonders resulting from the many eruptions. Right on the edge of KILAUEA Crater is the home of Dr. Thomas A. Jaggar, the leading Volcanologist of the world. We brought introductions to him from our Dr. Fred Taussig of St. Louis, who was a classmate of Dr. Jaggar at Harvard. It was a rare privilege to have Dr. Jaggar in person show us the highlights of the Volcano district — the Lava Tubes, and the great craters, with steam seething out of fissures in hundreds of places, giving evidence that other eruptions would follow.

Long Island Again Host to POTATO GROWERS

By PAUL WORK

NASSAU and Suffolk counties are to entertain the 17th annual Long Island Potato Tour on June 20th and 21st.

Among special features to be observed will be heavy power equipment including 4-row planter; heavy dusting and spraying equipment; new developments in digging, grading and loading; sixty acres of rotary head irrigation; fertilizer experiments; and, of course, plots planted with certified seed from many sources.

Paul Work

The party is to start from Mineola, near the Court House, on Thursday, June 20th at 9:30 and from the Henry Perkins Hotel, Riverhead, on Friday, June 21st, at 7:30.

It is interesting to note that this tour is preceded on June 18th by the Eastern Shore Potato Tour which assembles at Pocomoke City, Maryland, and the New Jersey Potato Certification Conference at New Brunswick on June 19th. Here is quite a week for the potato fans.

Rakes and Rakes

I have a prejudice in favor of what is called the "level-back rake." The other sort is called the "bow" type. A level-back rake is perfectly straight across the back and is an excellent instrument for marking out rows in the garden by turning the rake upside down and moving the head lengthwise of the row. It gives a little trench for small seeds that is of even depth and with a smooth bottom. Then, after the sowing is done, the rake may be used the same way to cover. Finally, holding the rake handle vertically, one can easily tamp the soil over the seed to insure good contact which is necessary for absorption of moisture which in turn is essential for germination.

Season Still Late

While there has been some fairly warm weather since the middle of May, it will take some time for crops to catch up. My peas which were planted the 6th of April are now 8 or 10 inches high and the earliest planting of corn and beans is about 4 inches high.

For commercial vegetable growers, the delay in maturity may not be a wholly unmixed calamity for Southern crops have likewise been delayed in maturity and some heavy conflicts between sections at marketing time may have been avoided in this manner.

Grinding the Hoe

Most hoes come from the store with the edge beveled on the outside or lower edge. That is a very good way to keep the edge of the hoe from biting into the soil where it ought to be.

The young men, my sons, have a little motor and carborundum grinder on the bench in the cellar so I made the sparks fly for 15 minutes and now, the sharp edge is on the outside of the blade.

Then, I went back to the garden and you'd be surprised what a difference the change made in the effectiveness of

the implement in skimming along just under the surface taking every weed as it came and the job takes just about half the energy. That makes quite a difference in the course of a day's work or even a couple of hours' work.

Once the hoe is properly reground, it is well to have a file within easy reach so that the edge can be kept sharp. If one had all the horsepower of energy wasted in the use of dull tools, there would be enough to kill a whale of a lot of weeds.

Good Stand of Oats

While the papers are talking about farmers finishing up the seeding of oats, my crop is 6 inches high; at least, it was yesterday morning. The stand was good—that is, for a home garden. I did not have to buy the seed. It came in that big load of fresh manure that I put on the garden. Since yesterday morning, it has been taken down with a wheel hoe. Happily, oats are not as hard to eradicate as quack grass.

Container Laws to Be Enforced

Commissioner Noyes has announced that the law pertaining to marking on used containers of produce will be strictly enforced beginning June 1st.

The law provides that "when farm products of the same kind as the original contents are packed in used containers by others than the original packers and sold, offered for sale or transported for sale, any markings pertaining to the original contents shall be erased, obliterated or such container shall be conspicuously marked or labeled and in the case of bags or sacks tagged on the outside with the words 'NOT ORIGINAL CONTENTS' in letters at least one inch in height."

In the case of labels and crates, printed matter "shall be rendered illegible or so cancelled as to clearly indicate that such original markings do not apply to the contents of the package." Sacks may be turned wrongside out.

The law applies, for example, where tomatoes are packed in tomato boxes but not where carrots are packed in an orange crate.

At the same time that this law is

being enforced, those who are at the forefront in improving marketing methods are considering new packages and new labeling for New York state products. With them, it is not a case of what they can get away with but what plan will deliver maximum quality to the consumer and maximum returns to the producer.

Improved Crop Reporting Service

Both the United States Department of Agriculture at Washington and the Department of Agriculture and Markets in New York have materially improved their crop reporting service. Both Washington and Albany reports are gotten out more promptly so that information gathered up to the 1st or 15th of the month is mimeographed and mailed in the course of a couple of days. The coverage and accuracy of reports is constantly improving.

R. L. Gillette who is in charge of the New York service is very anxious to have the views of growers and others on ways in which this service could be more useful. There ought, by

all odds, to be a committee of growers working throughout the year to serve as a contact agency between this service and the men in the field.

Mimeographed monthly summaries are available on request to the office of the Federal State Agricultural Statistical Service at Albany. These reports should be much more fully used than they are.

How Cutting Alfalfa Affects the Stand

The question "Shall I cut alfalfa twice or three times?" involves an important decision. In general, experiments have shown that twice-a-year cutting results in maintaining a better stand over a longer period of years, and in many cases, on a three-year basis, cutting twice will give a better total yield than cutting three times.

There is no doubt that making the first cutting of alfalfa before it blossoms hurts the stand, even though only two cuttings a year are made, and the earlier the cutting is made, the greater the damage.

A Crusader for Cooperation

(Continued from Page 1)

the leadership. More recently the Maine Public Service Co. consented to give electricity to Guerette and Ouellette if they found 50 customers. They are found and are already cutting their own poles to fulfill their own share of the contract.

From his experience in northern Maine, and his observation of cooperatives in Nova Scotia, Father Soucy became convinced of the value of credit unions—the so-called poor man's banks.

He talked to his parishioners and explained how these cooperative thrift societies operate. He showed them how they could save even a few cents a week to build up a fund on which to draw in time of greater need. A credit union, he said, would be run by local men—by neighbors—who would make small loans to other neighbors. The interest rate would be fair to both borrower and lender.

Soon there were 420 members of credit unions in Guerette, Sinclair, Stockholm, St. Agatha, Daigle, and Keegan. For Father Soucy was no longer restricted to his own parishes.

He was put in charge of cooperative education for the Catholic church in Northern Aroostook county.

The Keegan credit union is new. The other five, in their first four months of operation, made loans totalling about \$2000, and members saved \$1800.

Cash to Foot the Bills

Telephones, electricity, highways and credit unions—Father Soucy's people needed them all. But they still needed one essential of modern life. They needed more cash income, and they needed it as badly as any group in the State. Reliable sources of additional income do not come easily these days and Father Soucy realized that there must be more than missionary work before they could get "what we are surely entitled to."

But that was no reason for giving up.

Without going into the whole history of the organization, it may be enough to say that Father Soucy gave his support to plans for a cooperative creamery to be located in Fort Kent. Characteristically, he sought the best advice and most promising assistance before the new organization got under way.

It was not easy. But after a careful analysis by representatives of the Maine Extension Service and Farm Security Administration, the farmers in the area formed the St. John Valley Cooperative Creamery on January 25, 1938. It looked as though \$14,000 might be necessary for plant and equipment before the creamery could make a pound of butter. There were comparatively few cows in the area, and the farmers were not dairymen.

Then, at the request of the directors of the creamery and others, the Maine Extension Service appointed Hubert Tracy as assistant county agent in the area to assist in educational work in connection with the growing interest in dairying.

Instead of spending \$14,000 on buildings and equipment, Tracy worked out a plan that actually put the creamery in operation with an expenditure of approximately \$3000. Some of the equipment was second-hand, and the building was formerly a blacksmith shop, leased for three years at a cost of \$15 a month. But the creamery started making butter.

The success of the creamery is not yet assured. Of the 175 men who have signed up, however, 110 shipped a total

Fresh Food the Year Around

IN LINE with our editorial policy of more living from the home farm, I urge farmers to study carefully the possibilities either of installing their own individual quick freezing refrigerator or of joining with their neighbors in a larger locker refrigerator plant. By either method the family can be assured of fresh fruit, vegetables and meats the year round.

A Minnesota Agricultural Experiment Station bulletin reports that Minnesota last year had 179 cold storage locker plants with 51,000 lockers in operation. Think what that means in better living to Minnesota farmers! Think what it would mean to you to keep vegetables and fruits for weeks as fresh as they were when they were picked, or to kill a beef or a hog and have the fresh meat until it was entirely consumed!

Write your College of Agriculture, or *American Agriculturist*, for bulletins and other information on cold storage lockers.

(Continued from opposite page)
of 19,842 pounds of butterfat to the creamery from May to October 1939. And about \$4265 was paid to those farmers in cream checks during the five months. This is a small amount, but it is additional cash coming into an area that is sorely in need of cash. And it is an encouraging beginning.

Homework for Skillful Hands

The handicraft cooperative venture is by far the most ambitious. Many women in northern Maine have helped increase the family income by knitting and crocheting at home. Their average daily income from these enterprises, according to Father Soucy, has been about 25 cents. He believes that the new plan he is backing can increase that average income to about \$1 a day.

Briefly, under the new homecraft project, women and girls will have an opportunity to knit or crochet socks, sweaters, bed jackets, rugs, and similar articles. The products will be marketed through a New York outlet which has agreed to act in this capacity for three years. An adjusted piece rate will be paid to all women, so that the price received for knitting a sweater, for example, will be the same regardless of the time it takes any particular woman to make it.

A trained worker in crafts, Mrs. Eugene LeBrun, has been made available by the State to assist in training the homecraft workers. The State is also assisting by making a small loan to buy yarn and other essentials.

Still newer than the handicraft project is a cooperative venture in turning out hardwood for wooden heels. Also on the program is a purchasing cooperative for farmers. The by-laws are now being prepared for this association which will deal principally in fertilizer, lime, farm implements and similar lines.

What is ahead for these cooperatives? It is still too early to say. But they will not fail from lack of the potent support constantly given by Father Soucy. He has opposition, some of the most determined is based on the idea that such goings on are no part of a priest's place in his parish. Father Soucy is just as firmly convinced that economic betterment is clearly a job for a priest. As Pope Pius XI said, "Help the body and you will gain the soul."

He devotes a large part of his time to his missionary work for the cooperative cause. Tireless, determined, convincing, he has spoken to as many as 14 groups in a single week, and traveled 1000 miles over the snow and ice of an Aroostook winter to keep those engagements. His cooperative work has now become so important that the bishop has sent an assistant priest to help with his parish work.

Dean Inge has said that every constructive movement has to go through three stages in its development and life. First, everybody ridicules it; second, they say it is against religion; and third, everybody knew it was going to be a success.

The new cooperatives in northern Aroostook have experienced the first two steps. Father Soucy and his friends believe that the third step will surely follow if the cooperative way of doing things continues to help his people gain "what we are surely entitled to."

"Maybe we better quit teasin' Willie fore he gets nervous B. O."

Truck Buyers Demand Facts- CHEVROLET TRUCKS are backed by Certified Proof!

100,000 MILES
at less than 1/2¢ a ton mile!

STOCK MODEL—Representatives of the Contest Board of the American Automobile Association selected engine and chassis at random from the assembly lines at Flint.

NEVER before was a truck subjected to so conclusive a test as that which a stock model 1½-ton Chevrolet, with a 2¼-ton load, underwent between January 11, 1938, and January 19, 1940, covering 100,015.9 miles under working conditions.

Every mile was under the observation of the Contest Board of the American Automobile Association, whose certificates of performance are recognized in this country and abroad as official.

CHEVROLET MOTOR DIVISION, General Motors Sales Corporation, DETROIT, MICHIGAN

OFFICIAL LOGGING OF RUN—Every item of cost was entered in detail by A.A.A. observers on the truck throughout the test.

AT CANADA'S CAPITAL—The truck left Detroit January 11, 1938, for Ottawa, Canada, to start its good-will trip to Mexico City.

UP PIKES PEAK—After 52,319 miles of the test, the truck, with 2¼-ton load, climbed to the summit of Pikes Peak without trouble of any kind.

AT DEATH VALLEY—The test went from 14,000 feet altitude to 280 feet below sea level—meeting every condition of highway.

STILL GOING STRONG—At the finish, the truck was running perfectly. For the last 10,000 miles, the oil mileage was better than for the whole run.

INSPECTION AT FINISH—A.A.A. technicians certify that many working parts were still within production dimensions; none was unfit for further service.

100,000-MILE TEST ROUTE—Canada and Mexico were included in the truck test. Each of the 48 States was visited at least twice.

Here's the Record!

Number of miles	100,015.9
Payload	4590 lb. (exclusive of driver and observer)
Gross weight	9260 lb. (with driver and observer)
Average speed	33.07 miles per hour
Average miles per gallon of gasoline	15.10
Miles per quart of oil consumed	1072
Oil actually consumed	93.29 quarts
Total operating cost per ton mile, including gas, oil, lubrication and repairs and replacements (including twelve tires)	\$0.00419

Effects of the European War on Dairy Markets in the United States

By LELAND SPENCER

PRICES of butter, cheese, and other dairy products have been somewhat higher this spring than they were last year. The wholesale price of butter in New York City will average about 3½ cents higher for the month of May this year than it was a year

ago. Likewise, the basic price of cheese, which is established on the Wisconsin Cheese Exchange, is about 1¼ cents a pound higher this May than last.

No doubt the European war is partly responsible for this increase in prices, although the main factor probably has been the increased consumption in the United States, and the reduction of

Leland Spencer

storage stocks which was brought about largely by the use of Government funds for distributing huge quantities of these products to families on relief. Recently there has been much speculation as to what effect the spread of the war to Denmark, Norway, Holland and Belgium will have on dairy markets in the United States. In the first place, it may be noted that our total exports of dairy products, in terms of milk equivalent, have been about 50 per cent larger during the seven months ending with March of this year than they were in the corresponding period during the five years 1935-39. Even at this rate our total exports of dairy products will be less than 1 per cent of the milk produced. When we compare the imports and exports of the various products during the seven months ending in March of this year with those for the same period of last year, we find there has been no striking change with respect to any of the products (table 1).

Denmark has been one of the leading exporters of butter. Most of the Danish butter exports have gone to Great Britain, but Germany has also been an important buyer. The effect of German occupation of Denmark will be to divert practically all of the Danish butter exports to Germany. Moreover, the butter output of Denmark is expected to be drastically reduced because of the shortage of feed. It is expected that a considerable proportion of the Danish cow population will be slaughtered before next fall. The main effect of the German occupation of Denmark, so far as dairy products are concerned, will be to deprive the British markets of Danish butter. Presumably this will be replaced by larger shipments from New Zealand and Australia.

The Netherlands has been an important exporter of cheese, as well as condensed and evaporated milk and pow-

dered milk. The effect of German occupation of the Netherlands will be to cut off these exports to the outside world, with the result that there will be a better opportunity for American firms to supply the demand for these products in other countries.

Altogether the spread of the European war will probably have a slightly favorable effect upon the demand for American dairy products. However, there is no indication as yet that the great expansion in exports of evaporated milk and other dairy products, which was experienced in the World War of 1914-18, will be repeated.

Exports and Imports of Certain Dairy Products During the Months September to March, inclusive.
Millions of pounds.

	1938-39	1939-40
Imports:		
Butter	641	702
Cheese	34,691	37,217
Canned milk	423	98
Powdered milk	29	561
Exports:		
Butter	1,404	1,701
Cheese	859	955
Canned Milk	16,011	21,121
Powdered milk	4,441	4,332

Chicago Milk Strike Ended Pending Negotiations

The strike of milk drivers in the City of Chicago has been ended, at least temporarily. Members of the Milk Drivers' Union voted on May 26 to return to work at once. The week strike had decreased the supply of milk for Chicago's consumers to about one-quarter of normal. In the course of the strike a lot of milk was dumped, and there was plenty of violence.

The trouble started on May 1 when the Associated Milk Dealers attempted to cut drivers' wages by about \$12.00 a week. They had been getting \$48.00 a week plus commissions. Drivers went on strike for two days and then went back to work pending settlement by negotiation, which broke down and was followed by a second strike.

The basis for the present agreement provides for a continuation of negotiations up to June 10. If an agreement is not reached by that time, the matter is to be referred to Mayor Edward Kelly of Chicago and States Attorney Thomas Courtney, the idea being that the dispute will be decided by arbitration. In the meantime drivers will receive the old scale of pay, part of which will be refunded after June 10 if eventual settlement calls for a reduction in wages.

A part of the drivers' pay in Chicago is in the form of commissions, and it has been pointed out that a scale of wages which results in the purchase of milk by more consumers at stores will defeat its own purpose by cutting commissions which drivers earn.

In discussing the strike, considerable emphasis has been placed on the fact that without capital investment, milk drivers get approximately the same for delivering a quart of milk as the farmer does for producing it.

John Haley, President of the Central New York Power Corporation, left, and Paul Smith, State Fair Director, discussing plans to increase interest in the New York State Fair. For three weeks, from August 1 to August 23, there will be an advance sale of State Fair tickets at 25c. Free passes to school children will still be given, but in view of the advance sale at reduced price, the giving of passes to adults will be limited.

THE LEAGUE STANDS FOR THE AMERICAN WAY

Israel Putnam UNHITCHED HIS HORSE FROM A PLOW TO RIDE 100 MILES TO THE BATTLE OF LEXINGTON

THE LEAGUE ASSURES A STABLE MILK MARKET WITH BETTER PRICES FOR ALL, SAYS THIS NEWFIELD MEMBER

Thirty-six years ago, Alfred Olli of Newfield, emigrated from Finland. He was a carpenter, but the "independence of farming" appealed to him. Today he is a director of the Newfield Local of the Dairymen's League Co-operative Association, Inc., enjoying all the independence and rights that the American Way of living affords.

"I belong to the Dairymen's League because I am sure of a market for my milk every day in the year," he says. "And because I know that I will get my check every month. There have been times when I probably could have received a few cents more a hundred for my milk, but I know that when every dairyman is looking for that few cents more a hundred, it isn't long before all of us are taking less money."

ASPIRIT of unity and brotherhood burned strong among American farmers back in 1775. When word first came that Lexington farmers had fired on British soldiers, Israel Putnam was plowing 100 miles away. Hurriedly unhitching his horse, and crying to his 16-year-old son to look after the farm, he galloped off to help. Next morning he was in Lexington. A few days later he had organized a regiment of farmers to fight in the Revolution.

Putnam's love of liberty dominated his entire life. His belief in organization and co-operative effort helped greatly to make America free.

• • •

Years after Putnam had died, unscrupulous milk dealers realized they never could dictate milk prices until the united ranks of farmers were broken. That's when they began to sow seeds of hatred, fear and suspicion among farmers. That's when they began to spread falsehoods from farmer to farmer, and from group to group.

And that's when the Dairymen's League was formed . . . by a group of farmers determined to stick together at all hazards . . . resolved to fight for the rights and liberty of all farmers until those rights were won.

Everyone knows the history of that fight. Everyone knows that it raged for years . . . until gradually the faith and steadfastness of the early Farmer Fathers of this Country was rekindled. Then and then only throughout the milkshed was heard the cry: "Unite and fight." Farmer joined with farmer. Co-operative joined with co-operative. And the strength and discipline of united, organized farmers won the day.

Of course, the fight is not over. Perhaps it never will be. There'll always be snipers. There'll always be raiding parties making sudden forays at suspected weak spots. And there may always be a "Fifth Column" seeking to betray farmers from within. But united strength . . . organized strategy . . . and unfailing watchfulness will hold the ground that has been won. United farmers made America free . . . and united farmers will keep it free. That's the American Way of life . . . the way that leads straight to America's glorious promise of "life, liberty and the pursuit of happiness" for farmer and city-man alike.

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

By L. B. SKEFFINGTON

from SKEFF'S NOTEBOOK

THE Eastern Apple Box Conference, representing 14 states, has made recommendations to standardize size and dimensions of boxes. It has recommended that oversize boxes be limited to one and one-eighth bushels. Many boxes now in use measure one and one-fifth bushels when bulge packed.

Two boxes are recommended in each type. Sizes for count and layer packing are 15 by 12½ by 11½ inches, or the western box measuring 18 by 11½ by 10½ inches. Sizes for jumble and face-and-fill packing are: 11½ by 13½ by 16 inches and 11 by 13 by 17 inches. The first box in this type is recommended for New York, New England and Pennsylvania and the latter box for Virginia, West Virginia and Maryland.

Too Many Boxes Confusing

There has been growing confusion in the apple industry owing to the number and variety of boxes. When boxes began to replace baskets it was thought one of the problems of the industry had been solved. The practice had grown up of packing the bushel basket to a rounded bulge to protect against shrinkage. First boxes were designed to hold the contents of a bulged bushel basket packed even to the top of the box. Next the practice of packing the boxes to a bulge developed. The trade was quick to take advantage of this and a packer who put

Testimonial Dinner to E. M. Harmon

On the evening of June 13, at Syracuse, dairymen of New York State, led by the Metropolitan Bargaining Agency and assisted by the Syracuse Chamber of Commerce, will give a dinner in honor of E. M. Harmon for his fine work as Administrator of the Federal Milk Marketing Order in the New York milk shed.

Secretary Wallace has moved Mr. Harmon to another position at Washington and New York dairymen did not want the opportunity to pass without letting him know of the high respect they have for him personally, and for his efficient work in helping to stabilize the New York milk market.

more apples in his box found an easier route to market. Reaction followed and many growers and packers complained they had to give away extra fruit in order to sell a bushel.

In the meantime the number and types of boxes grew. I know of several instances where growers had to take their apples out of one type of

box and repack them in another type in order to sell them. Rivalry between styles and sizes of boxes kept the trade, the packers and the box manufacturers "up in the air." When things got bad enough growers began to talk about getting together. The conference has no power to enforce the new sizes or styles, but horticultural societies and farm bureaus are expected to get back of them. In the meantime the conference hopes to be able to get Congress to provide for standardization or uniformity of packages.

To Study Research Program

The Western New York and Hudson Valley joint fruit committees are planning for a meeting at the Geneva Experiment Station this month at which a research program for fruit in the state will be studied. The joint committees have been doing considerable preliminary work on many of the more pressing problems. While these committees were appointed by the Horticultural Society and Farm Bureau Federation for one year, it is assumed they will require at least two years to develop and test programs.

The visit to Geneva is part of a plan to have a complete summarized report of all the research work being done or planned for fruit in the state. The committee will meet with growers in all sections in an effort to determine what is needed, and with the experiment station staffs at Geneva and Cornell to survey facilities and plans. It then will draft a program and submit it at a public meeting for discussion.

* * *

Another activity at present is to formulate a program for aid to growers in removing dead or undesirable trees. Recommendations along this line shortly will be submitted to the State Soil Conservation Committee and to officials at Washington. The committee feels that the old and useless trees are a liability and that their removal would be in line with better use of the land. But several years of low prices have left many growers financially unable to do the job entirely on their own. Another angle is that the removal of many poor trees would lessen the competition of poor fruit with good fruit.

Festival Big Success

Western New York's 10th annual Apple Blossom Festival, staged this year at Batavia, proved to be a huge success. In spite of cool and threatening weather, estimates of the crowd range up to 45,000. Doris Falke of Romulus, sponsored by a Seneca County committee of growers headed by Herman Kappel, was chosen Queen of Queens and will retain the sceptre for a year.

The festival has made such great gains in public favor that there is strong sentiment to drop the "Apple Blossom" from its name on the theory that it is a general rural and agricultural festival. This year even the muck

gardeners and the Dairymen's League had floats in line. Roy Porter, potato grower, presided at the festival luncheon. Apple men counter with the suggestion that "Apple Blossom" is a good and well established trade mark of spring-time.

A.A.-Grange Cooking Contest News

LITCHFIELD Grange of Herkimer County has the novel idea of selling copies of recipes used by the winners of its sugar cookie contest, held recently in connection with the state-wide cookie match being sponsored jointly by New York State Grange and *American Agriculturist*. Mrs. Louis Campbell, chairman of Litchfield Grange's Service and Hospitality, Committee writes:

"Our contest was a huge success, and you will note that there was a tie for first place. The judges had a difficult task as the entries were excellent examples of cookie making. We auctioned off the cookies after the judging and realized \$2.12. We are also selling winners' recipes for 5c a copy."

So many Granges have held their cookie contests during the past few weeks that we do not have space in this issue to print the entire list of winners. In our next issue (June 22),

however, we will bring the list up to date and announce all prizes to be given to Pomona and State winners. Also, we hope to have space to print more of the interesting comments and contest news items which are coming in from Grange chairmen who have charge of the local contests.

WHEN YOU NEED SPEED

-you need high compression!

"You sure finished that job in the nick of time, Jim!"
"Never would have made it without this fast-moving tractor."

Good farming means taking advantage of today's sunshine *today!* That calls for the time-saving performance high compression can give you. Remember, there are two basic reasons why high compression tractors save time, do work faster:

First, because high compression gives you more *power*. You pull more tools or pull the same tools in a higher gear. You work more acres per day, finish field jobs faster, catch up on work which has been delayed by weather, and get your crop to market earlier.

Second, high compression tractors are designed along automotive principles to use good *gasoline*. You save time because they warm up easily, aren't likely to stall and don't require constant fussing with the radiator *curtain*. Gasoline power *also* is better adjusted to *the* speed and load require-

ments of many different types of farm *work*.

But time-saving is only half the story of high compression. You can get *more work* out of a gallon of good gasoline than you can out of a gallon of tractor fuel. Gasoline-driven tractors also show big savings on oil consumption because there is less crankcase dilution.

When you consider buying your next tractor, talk these facts over with one of your neighbors who has a high compression machine.

Arrange for a demonstration with a dealer who sells high compression tractors. That's the way to find out what time-saving performance and economy in farming really mean.

Ethyl Gasoline Corporation, Chrysler Building, New York, N.Y., manufacturer of anti-knock fluids used by oil companies to improve gasoline.

SEE HOW THE TREND to high compression has speeded up. High compression tractors made their first commercial appearance only a few years ago. Today all farm tractor manufacturers offer models having high compression engines, either standard or optional, for use with good gasoline.

PLOW IN A HIGHER GEAR! Get a high compression tractor in time for your fall plowing—or see your dealer about changing over your present machine to high compression. Many farmers have told us that the extra power of high compression and good gasoline permits them to plow faster in a higher gear. Others pull three plows instead of two at the same speed. Either way you'll save valuable time!

DOWN THE Alley

By J. F. (DOC.) ROBERTS

BY WHAT line of reasoning can billions of dollars be spent for labor to produce armaments, and millions of men, taking more billions of dollars, blow up these same armaments; and at the same time have wheat make record losses, lard break more in one day than it ever did before, the stock market break to a two-year low—in fact, our whole economic structure go on the skids? Mass hysteria is the only answer.

You are probably asking, "What has this to do with a live stock column?" It all develops around time. Livestock is a comparatively long-time operation, and time is the most important factor in any hysteria. I simply do not believe it is good business, or good patriotism to sell Democracy short. Neither do I believe it is the time for great expansion, yet livestock can show a tremendous increase in the Northeast without getting into a dangerous expansion program. We can learn to use our heritage of grass and roughage, and do it now, along safe, sane, and sound economic principles. I say this realizing that our exports are light now, may continue to be light and possibly lighter, through the summer. But eventually, maybe next winter or spring, it is surely going to be imperative that we be in a position to feed the men that are engaged in this holocaust, in one way or another. If there was not a crying permanent need for more livestock in the Northeast, this appraisal of the situation might be out of order, but ask yourself how many beautiful green fields and pastures are pleasing your eye now, that next fall will be a tangled mass of brown, unused grass, weeds and bushes.

Did you read in the last issue of "The American Agriculturist", (New York edition) about the Eastern Aberdeen-Angus sale, held at the Cornell University Pavilion in Ithaca on May 13th? All pure-bred breeders and all of us who are trying to improve breeding (and who isn't?) ought to have such supervised sales for our horses, sheep, hogs and cattle. In fact, there

ought to be one sale a year, where we can go with confidence, and with open competition, buy our replacements. Where also we could take our good livestock, if passed by the committee, and not only get its competitive price value, but so establish values on all pure-bred replacement livestock. Get together, you Breeders' Associations, and others. This most valuable service only needs your promotional efforts to become a realization. Every State College has the facilities, and would be sure to cooperate with united effort on your part.

A hay crop in the Northeast is almost assured; recent rains, and now a hot sun, spell hay and lots of it. Cut early and make the most of this situation this year. Incidentally, the Middle West is very late with its corn planting, but those states, as well as the range country, including Texas, have had good spring rains, so prospectively, barring the late spring, the entire country faces a good growing season. If you have been held up this spring, it is not too late to put in soy beans, and if they are cut for hay when about two-thirds ripe, they are one of the finest live stock roughage feeds. O, yes! don't forget you were planning to plant some corn this spring!

Taken last fall, this is a snapshot of Frank Potter, West Oneonta, New York. When the picture was taken, the colt was 4 months and 1 day old. She is the great-granddaughter of a gray mare which Mr. Potter's father bought in 1889. This mare had 12 colts, and 11 of them were raised. The colt represents the fifth generation of horses owned on the Potter farm which trace their ancestors back to this grand old mare.

Help prevent PUFFS, STRAINS AND SWELLINGS

from causing
costly lay-ups

LAY-UPS ARE COSTLY when there's work to be done—That's why many farmers use Absorbine to help prevent strains, puffs and other everyday accidents from becoming permanent injuries.

Absorbine's fast action relieves soreness—speeds the blood flow. Opens up small blood vessels, bruised and clogged. Washes out "muscle acid" that causes soreness. Often relieves lameness and swelling within a few hours. Applied to cuts and open sores, Absorbine tends to prevent infection. Used effectively to treat collar gall, windgall, fresh bog spavin and other everyday casualties that may mean costly lay-ups. \$2.50 the long-lasting bottle at all druggists or postpaid.

MY CHICKS WERE DYING LIKE FLIES!

"Until the Dr. Salsbury Dealer Told Me How to Fight COCCIDIOSIS"

This is the season for coccidiosis! So be prepared to act quickly at the first sign of trouble. Keep a bottle of Dr. Salsbury's Rakos on hand for immediate treatment.

A scientifically blended liquid flock treatment, Rakos mixes readily with ground grain or other scratch feed—or may be used in drinking water. Rich in chemicals that check bleeding and tend to reduce inflammation... with ingredients that sharpen the appetite.

Give your flock Rakos at the first sign of coccidiosis. Get a bottle today. See your Dr. Salsbury dealer, who may be a hatcheryman, druggist, feed or produce dealer.

Also spray the litter with Dr. Salsbury's Mite-O-Cide—kills coccidia on contact. Inexpensive.

NEARBY MARKETS for NEARBY POULTRYMEN

"My Partner, The Hen"

By OLIVER WILLIAMS,

in an interview with H. L. Cosline.

ABOUT midway between the towns of Middlesex and Rushville, Yates County, N. Y., is Hickory Grove Farm, the father and son partnership of L. C. and O. S. Williams. It is a general farm with an excellent flock of sheep, twelve cows with a D.H.I.A. average of 348 lbs. of butterfat, and a good-sized poultry enterprise. Oliver, the son, is the poultryman.

"My first venture in poultry," said Oliver, "consisted of two setting hens. That venture was liquidated rather suddenly when a skunk decided to enter into partnership with me."

"In 1915 I went into chickens in a small way. I bought some baby chicks, and the next winter had about 100 laying pullets. Because the business has expanded rather gradually, our hens are housed in several buildings, which I realize is not a good idea so far as labor efficiency is concerned. Three years ago we built a two-floor laying house that accommodates 600 hens, and in all we keep about 2,000 layers besides hatching quite a few chicks."

"For a number of years we kept Leghorns. Then we ran into certain disease troubles, and finally switched over to Rhode Island Reds. I raise about 1,200 pullets every spring; and for a year or two my son, who is in school, has raised about 400 on his own account. The boy represents the fourth generation on this farm."

"What is your program for raising

Oliver Williams with an early hatched Rhode Island Red pullet.

we have been successful in keeping losses down, and I think we raise pretty good pullets. I like to keep them just a little hungry rather than to keep them stuffed with feed all of the time."

"What do you do with your eggs?" was my next question.

"For a good share of the year I use quite a lot in incubators. I sell some direct to consumers in Geneva, and at times during the year I ship direct to Boston."

"Do you raise your own feed?"

"No, except wheat for the scratch feed. Last year we had 24 acres of wheat, and this pretty nearly carried us through the season so far as wheat for the scratch feed was concerned."

Oliver Williams has an interesting angle on breeding. Because he runs a general farm and because his father is not as active in farm work as he once was, he feels that it is not practicable to do pedigree breeding. Therefore, he buys pedigreed cockerels from a well-known Rhode Island Red breeder each spring. You may judge something of the quality he gets by the fact that he pays the considerable sum of \$1.25 each for these day-old, wing-banded, pedigreed cockerels.

The buildings are all wired for electricity, and chicks are brooded under electric hovers. Lights are put on the pullets in the fall and on old hens soon after Christmas.

If you happen to drive by the Williams' farm, stop for a minute. Oliver likes to talk chickens, and you will see a good, practical sideline poultry enterprise which, if you want to take my word for it, is run with above average efficiency.

The pullets are not raised on wire, but the houses have one section of wire on which the feed hoppers are placed to keep them clean.

pullets?" I inquired. As I asked the question, we were looking over the pullets which are kept in four pens in a long brooder house.

"I keep the chicks in the battery for about ten days," replied Mr. Williams. "Then I bring them out to this house and, in the case of the early-hatched birds, I let them out on the ground as soon as the weather permits. The birds you see here were hatched on February 6. Then about the 15th of April, I move them out to range shelters, putting about 75 in each shelter, which are spaced 200 feet apart. The shelters are on a sod range and have not been moved for about five years. I mow the range which has good drainage so that it doesn't get wet."

"My own theory is that if pullets are started in confinement, they should be kept in confinement. In other words, I do not think the two systems mix. I figure to get them on the ground as soon as possible."

"I realize the advantages of rotating the range, but it doesn't seem very practical with our layout. Anyway,

"If that's Lincoln, Maw, then the penny I have is a counterfeit."

"How I Retail Eggs"

Several Customers to a Block

I have a small farm near Weedsport, New York, devoted almost entirely to poultry, various kinds of berries, and asparagus. Almost without design, I developed an egg route in Auburn through peddling berries when stores were glutted with berries, and house-to-house work seemed the only means of marketing this perishable fruit.

I took eggs along with the berries, and many customers thus obtained have been with me more than ten years. I usually receive about five cents a dozen more than producers obtain from New York City or local stores, and sell a few dressed chickens at retail each week, thus culling the year around. I sell most of my eggs in about five city blocks to people of the upper middle class. Unless there are several customers in a block, I think retail selling is hardly worth the time it takes.

During the asparagus season, I retail this vegetable two or three times a week in bunches, breaking stalks above ground and trimming butts so no waste is sold to customers. Retailing asparagus and berries makes it practicable to dispose of eggs while really fresh in warm weather. One disadvantage of retailing is loss of time visiting with the customers who seem sociable.—B. T. Dougherty.

* * *

Sells at Home

When this year's pullets begin to lay eggs, I intend to sell according to a plan I followed for two years before we took a rest from hens. I began by advertising in our daily paper for three days: "Strictly Fresh Eggs," and signed my name and phone number. People came and told their friends.

I sold eggs only at my door—the price for less than five dozens, one cent less than the local retail price; for from five to nine dozens, two cents less; for from ten to fourteen dozens, three cents less; and for fifteen dozens or more, four cents less.

My eggs were always clean, and I guaranteed not to sell any eggs more than two days old. I was shipping to New York when I began this plan, but I soon ceased shipping.

A grocer who specialized in fresh eggs was glad to call if I had a surplus. Customers who bought in large quantities soon learned to phone to find out if I had enough.

This method of selling was easier and paid better than shipping. It also gave an opportunity to sell the surplus from our garden. While customers were always welcome, I didn't promise to be at home except from 7:00 to 8:30 A. M. and from 5:00 to 7:30 P. M., except by appointment. Thus my time was not badly broken up. I made no sales on Sunday.—Mrs. E. C. Fisher, Geneva, N. Y.

* * *

Strictly Fresh

I started selling eggs on a retail route in the City of Plattsburg fifteen years ago. I had around sixty private customers then, and have never had a dissatisfied customer. I am still selling to the same ones.

I sell only my own eggs on a money-back or replacement guarantee. All eggs are absolutely clean and strictly fresh, and are put up in one-dozen packages. I find that good customers will cheerfully pay more for eggs they know are only the best, and I never have any trouble selling out. At times I could sell more, but I never buy eggs from anyone to retail for I could not guarantee them.—Mrs. W. A. Blair, Mooers, N. Y.

For Mothers-to-Be

BY MRS. GRACE WATKINS HUCKETT

Clothing

CLOTHING during the period of expectancy is important, both psychologically and physically. If a woman feels that she is becomingly dressed, she can go about her normal life with a far greater degree of satisfaction. Due to figure changes the clothing must be of an adjustable nature.

In most instances a maternity corset or some form of support is used, not only for looks but for relieving back strain. Supporters attached to the corset are often preferred over round garters, because the latter tend to check circulation in the legs. No garment should be tight enough to bind at any point. Any small source of clothing discomfort ought to be avoided; oftentimes it is merely a matter of properly designed garments, not always an extra expense. This is a time for even greater attention than usual to small details of grooming such as hair, nails, and makeup if used at all. It is more important than ever to select colors that are becoming.

Shoes require more than ordinary thought because the sense of balance is often disturbed. Lower, broader heels are recommended; ties rather than straps, which hinder circulation, are also more comfortable.

The layette for the expected infant will also assume great importance, especially if it be the first baby. As a matter of fact during the first few months of a baby's life, his clothing needs are simple. Materials should be of soft, smooth texture to avoid irritating tender skin, a firm enough weave to stand much laundering, seams flat where possible, very little trimming to scratch neck or chin, and no lumpiness for the baby to lie on.

SMOCK-DRESS PATTERN NO. 3078 is comfortable, concealing and chic, all desirable qualifications in a garment for the mother-to-be. The wrap-around skirt front is adjustable, while the panel lines keep it symmetrical and slenderizing. Sizes 12 to 42. Size 36 requires 4½ yards of 39-inch material, ¼ yard 39-inch contrasting.

WRAP-AROUND SLIP PATTERN NO. 3081 features a wrap-around panel which adapts it to figure needs. Sizes 12 to 46. Size 36 requires 3¼ yards of 35-inch material.

HOUSECOAT PATTERN NO. 2829 is a comfortable wrap-around with long, slim lines. The pattern includes a high neck collar as well as long sleeves. Sizes 14 to 48. Size 36 requires 7 yards of 39-inch material.

LAYETTE PATTERN NO. 2781 includes practically the baby's entire wardrobe—a dress, kimona, slip, nightgown, coat and cap. One size. Short kimona requires ¾ yard of 35-inch material; dress, 1½ yards 35-inch material, 1 yard lace edging; nightgown, 1½ yards 35-inch material; slip, ¾ yard 35-inch; long kimona, 1½ yards 35-inch; coat and cap, 1½ yards 35-in. or ⅞ yard 54-inch material with ⅞ yards 39-inch lining.

TO ORDER: Write name, address, pattern size and number clearly and enclose 15c in stamps. Address pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new summer fashion catalog.

Food

DIETS of mother and child seem doubly important during warm weather since digestive upsets are apt to occur at that time. This may be due to various causes, nerves, sleeplessness, discomfort from heat or whatnot.

If the mother is an expectant one, her diet need not differ materially from her usual one, providing the usual is suitable for general health purposes. The idea of "eating for two" does not hold until the fifth month of pregnancy at which time the child begins to gain weight rapidly. Yet at no time should large quantities be eaten which are apt to cause distress. It is better to have a mid-morning and mid-afternoon lunch of a glass of milk and a cracker than to overload the stomach at mealtime. Eating lightly several times a day often helps to prevent the nausea felt in early months of pregnancy. It is suggested that if she take a cup of hot milk or hot milk and coffee and some

Simple Soul

By Edith Shaw Butler.

I think somehow that she will feel

Out of place in Heaven
Without her sunny kitchen there,

And breakfast at seven

For hungry men who've just come in

From doing morning chores.
She'll long to see her braided rugs

Upon the golden floors.

She'll miss her shining pots and pans,

Her earthen mixing bowls.
She'll wonder what to talk about

To all those shining souls.

crackers before getting up and then eat more frequently than three times a day, probably she will be able to control the nausea.

Besides, milk is a good source of calcium, very essential in forming teeth, laid down in the baby's gums in the early months of pregnancy.

Excretory organs—bowels, kidneys and skin—have to function for both mother and unborn child. Therefore a light laxative diet, satisfying yet nutritious, is the best kind. She needs a large proportion of liquids—2 to 3 quarts per day, including water of course; a small portion of meats (once a day); generous proportions of vegetables and fruits. Milk is valuable because it contains all food elements besides stimulating the kidneys and preparing for nursing. It is not necessary to omit tea and coffee, just reduce the amount taken. No alcoholic drinks of any sort are allowed because evidence shows that alcohol may enter unchanged from mother's to baby's system and do injury.

It is better to use laxative foods rather than purgatives or enemas.

(Continued on opposite page)

Comfort

KEEPING baby comfortable during warm weather helps to keep him happy—and indirectly the family as well. A clean, dry, warm room with plenty of light but no glare, plenty of fresh air but no drafts, is the ideal room for him. Such a room costs city people dearly but should be easy enough to achieve in the open country.

Screening doors and windows against flies and mosquitoes is an aid not only to comfort but to health, because bites from insects often spread disease. If there is only one window in the room, the problem of ventilation may be solved by putting adjustable cloth screens at top and bottom of sashes adjusted to accommodate them. Such screens are available from variety stores or from mail order houses. A folding screen is also a help in avoiding possible drafts over the baby's basket or crib. The fly nuisance may be controlled by seeing that there is no uncovered garbage, manure, or other fly breeding places around the premises.

In addition to having a sunny, airy and scrupulously clean room for the baby, his habits of rest are less disturbed if this room is for him alone. Washable rugs, curtains, and furniture, bare or linoleum-covered floor, are further aids to cleanliness. Keeping the room temperature as even as possible is always difficult if the house is much exposed; yet this is important. Of course in summer, even little babies may be placed on a sheltered porch, or even outdoors if protected from direct drafts, glare and possible insect bites.

Sun-bathing starts at a tender age and needs to be a gradual process. The time for sun-bathing varies with the season—before 10 a. m. and after 2 p. m. in the summer, and between 10 a. m. and 2 p. m. in fall, winter and early spring. Gradually more surface can be exposed and for a longer period, beginning with 5 min. on arms and legs and working up to 15 min. exposing the whole body. At no time should the baby's eyes be exposed to the direct rays of the sun. Even creeping babies wear little sunsuits while in their playpens outdoors; this makes it possible to store away the sunlight vitamin against the winter's needs. Such garments are not only healthful but save the mother much work.

For one big item in care of children is the mother's care of herself. It is NOT being a good mother to neglect oneself. A nursing mother needs to eat plain, nourishing food four times a day, having a bedtime lunch of cereal gruel or milk. On farms where women rise early and have much physical activity, a mid-morning and mid-afternoon glass of milk is also a help.

Rest—and I know how hard it is for busy women to get this—is an absolute necessity if a mother's nerves and health are to be conserved. Eight or nine hours sleep at night and an hour's rest in the afternoon will do more than any medicine to keep her well. That afternoon rest seems impossible to get in many cases but late afternoon, when children are most trying and grown-up's nerves are somewhat frazzled, can be made far more pleasant if the mother is rested enough to meet the

(Continued on opposite page)

Food

(Continued from opposite page)

Fresh fruits, apples, peaches, pears, apricots, oranges, figs, pineapple, prunes, raspberries and grapefruit are very beneficial. Cooked dried fruits are an excellent substitute if the fresh ones are lacking.

An abundance of graham and whole wheat bread, cornmeal and bran foods are other natural aids to elimination. Fresh vegetables, especially the green ones eaten with olive oil dressing are also laxative.

Nowadays practically everyone knows that the best possible food for the baby is its mother's milk. Now the doctors are recommending in addition, strained fresh orange juice as early as the tender age of one month. Tomato juice is another good source of vitamin C. By the time the baby is six or seven months old the doctor will probably advise adding strained solid

iron content. Cereals, bread and potatoes yield energy, being called fuel foods. Vegetables and fruits are valuable for minerals and vitamins. Two vegetables daily besides potatoes are needed. For children, the leafy vegetables may be chopped finely—carrots grated, others chopped and served, cooked, with white sauce. Tomatoes, valuable for vitamins and minerals, should be strained for young children.

Two fruits a day help make this balanced diet. Both MAY be raw; at least one SHOULD be raw. Fruit juice, orange or tomato, or scraped or sieved pulp of fruits are given to babies. Ripe bananas, apples, peaches, apricots, prunes and cherries offer a sufficient variety for simple desserts for children.

Feeding children requires more than mere preparation of food. Sometimes it requires a diplomat, and certainly requires cooperation on the part of the family. It is during childhood that food prejudices are formed—prejudices which usually are planted in their minds by older people. The happiest person is one who can eat any wholesome food, for it is not merely a matter of getting enough to eat but being adjusted to situations as they arise throughout one's whole life.

Night Is My Listener

By Lansing Christman.

The house is quiet.
Sleepers lie unaware of the night,
And its moon and the stars.
The wood fire hums and crackles.
I am its only listener.
I pick up a book of poems and read aloud
Songs of green hills and woodland springs,
Songs found by the poet in earth and stone.
Night is my only listener.

foods—vegetables, gruel, etc., if the baby has no digestive troubles. If the baby is bottle-fed, every precaution must be taken to sterilize his food and everything with which it comes in contact. Furthermore, cod-liver oil must be given as soon as orange or tomato juice is started.

For the older child, the diet has to be varied to include all types of food. Anyone who has fed a child knows that he has to learn to eat new foods, and one refusal need not mean that he cannot learn to overcome his objections. It is better to give a small bit at first and gradually accustom him to the new food than to take a first "no" as a positive answer for all time. Try again and again, without any fuss over it.

The same principles underlie diet for a child as for an adult, the difference being in amounts taken. Milk, at least one pint a day, preferably one quart, is fundamental in the diet. Eggs and meat are necessary for building; one whole egg daily should be allowed for a pre-school child and is an excellent thing for his mother as well. Liver is important because of its vitamin and

Comfort

(Continued from opposite page)

situation. Otherwise what should be a pleasant end to the day may be just the opposite. Besides having adequate rest, some recreation helps to keep the mother in a happier frame of mind. Usually she needs an occasional afternoon or evening out, just to get away from the daily grind of the routine.

Planning and keeping a definite routine is not only more efficient but makes everyone happier as well. Even a little baby learns very quickly when to expect food or the bath; also his toilet habits are more regular if there is a definite time for them. Dr. Helen Monsch of the N. Y. S. College of Home Economics has started hundreds of babies on the way to healthful childhood and we print her recommended day's program for the baby. Also the State Health Department in most states is glad to furnish, upon request, excellent pamphlets containing such schedules and much other useful information pertaining to baby's care.

A Day's Program for the Baby

The following routine is suggested by the N. Y. S. College of Home Economics as one which has proved satisfactory in many actual situations.

Schedule

Morning

6:00- Feeding
6:45- Chair (bowel movement)
7:00- Cod-liver oil
7:30- Bath
8:00- Orange juice
8:15- Chair (urination)
*8:20-10:00 Sleep out of doors
10:00- Feeding
10:30- Chair (urination)
*10:00-2:00 Sleep out of doors

Afternoon

2:00- Feeding
2:30- Chair (bowel movement)
*2:40-5:45 Wheeled out in carriage. Play time. (out of doors later as baby gets older)
5:00- Chair (urination)
5:30- Undressed
6:00- Feeding
6:40- Chair (urination)
6:45- Bed
10:00- Feeding (if necessary)

The starred hours may be used in part for the baby's sun bath. When the baby is very young, he will sleep all of the hours of the day that he is not being fed or bathed, from twenty—to twenty-two hours a day. Later, less and less sleep will be necessary until by the end of the year he will sleep not more than 15 or 18 hours a day, and his waking hours will be filled more and more with free play or exercise.

Just see what has happened to OIL RANGES!

Have you used a Modern PERFECTION?

You'll never know how much *better* your cooking and baking can be until you've *used* a new Perfection. For the new Perfections are as improved in *performance* as they are in appearance over oil stoves of 10 years ago.

The High-Power Burners give you instant, clean, easily regulated heat that *stays set*. The "Live Heat" oven helps make your baking better than ever.

And you save fuel money with Perfection because it burns dependable, inexpensive kerosene, the modern economy fuel. See the beautiful, "High-Power" Perfections at your Dealer's. Wide range of models, sizes and prices—and an easy purchase plan.

You get the world's lowest cost modern refrigeration with SUPERFEX Oil Burning Refrigerator—a Perfection product.

WHY SUFFER Functional FEMALE COMPLAINTS

Lydia E. Pinkham's Vegetable Compound Has Helped Thousands!

Few women today do not have some sign of functional trouble. Maybe you've noticed YOURSELF getting restless, moody, nervous, depressed lately—your work too much for you—Then try Lydia E. Pinkham's Vegetable Compound to help quiet unstrung nerves, relieve monthly pain (cramps, backache, headache) and weak dizzy fainting spells due to functional disorders.

For over 60 years Pinkham's Compound has helped hundreds of thousands of weak, rundown nervous women to go smiling thru "difficult times." Since it's helped so many women for so many years, don't you think it's good proof YOU too should take Pinkham's? Start today without fail!

Note: Lydia E. Pinkham's Vegetable Compound comes in liquid or handy to carry tablet form (similar formula).

"Have we a garage? I don't know. My wife has just gone out to get the car!"

"THE LAND Shall Sustain You"

By ROMEYN BERRY

WE'VE BEEN farming only four years. Four years isn't long enough to justify newcomers in getting up and testifying in meeting. But perhaps you won't mind our telling how some things look to us on first impression, provided we admit at the start that we don't know much and will probably change our opinions a good many times in the next few years.

The way it looks to us now is that farms hereabouts are adapted to raising everything a family needs except cash and that cash is the one thing farmers are trying hardest to raise. On the basis of that observation, we've been trying to run our farm so that we can get along without cash — or with very little, anyway — to the end that we shall be as nearly self-sustaining as is humanly possible; to raise everything we need or else get along without it. And it looks as if the getting along without part is just as important as the raising part. The world is full of so many desirable things that we can get along without!

I would not create the impression that we have achieved our lofty aim of getting along without cash or have even come close, but we're moving a little nearer to it every year, and right now it hurts our pride when we have to buy something to eat at the store. In four years we've bought exactly one pound of butter, and that was a mistake we're sorry about. Company dropped in on us one time when we were low, and we slipped down to the corners and bought a pound just to be sure we wouldn't run out. It turned out we had plenty without it, and we shall always regret the purchased pound that spoiled our butter record.

We haven't parted company with the coal man for good and all, but the woodlot supplies most of our fuel, and we expect pretty soon to get it all from there. We make our own bread, of course, and we think we've located a place near enough to home where we can have our flour ground from our own wheat. When we get that part of the program fixed up, we'll be

as nearly self-sustaining as the early settlers were; and just as soon as two long-legged heifers put their hair up and let their skirts down, every cow on the place will be of our own raising—none bought.

Pork, chickens, an adequate root cellar, peewee pullet eggs preserved in water-glass, a pressure cooker that cans a little every day from June to October fill in the dietary gaps; and the next bull calf is ticketed for beef and not for sale. That's a start anyway, and the biggest help we could have would be a new cook book or a Home Bureau lady on the radio who could talk 25 words without sending us to the store.

What we need up our road is more recipes that start, "Take your gun and shoot yourself a nice, fat rabbit," or "Go down cellar and pick a chunk of lean salt pork out of the barrel, place it in a baking dish, and cover with sliced greening apples. Add a generous hunk of maple sugar; put in a slow oven; and stick around 'til dinner time." There should be fewer rules — much fewer—which begin, "To a half pound of raisins and a cup of chopped English walnuts, add a can of condensed milk and sift in two cups of special pastry flour." We haven't a single one of those ingredients on the farm and don't expect to have.

In this part of the country there ought to be a law against a cook book or radio lady mentioning any shortening other than lard, butter, or chicken fat; and why keep harping on chopped round for meat loaf when fresh beef is the one meat farmers are least apt to have on hand? Chopped corned beef (well freshened) with onions, bread crumbs, and a little sausage added, beats any store meat loaf; and there isn't anything in it that you have to spend a nickel for.

We suspect, too, that things would be better up our road if the folks did more swapping and less buying. A neighbor's swap is apt to be engineered on an even-Stephen basis, whereas in a cash transaction most small farmers like us buy in a retail market, sell in

a wholesale one, which is not conducive to improving the cash condition. Any way you look at it, the trouble with farming simmers down more and more to cash. That's the main trouble, too, with taxes—cash. The time has passed, unfortunately, when one could pay his school taxes with stovewood; his town taxes with the labor of his hands and horses.

It's pretty disconcerting news that's coming in every twenty minutes over the radio these days. The one thing we've ever been able to count on in a changing world is change, and it looks now as if the changes were about to crowd in upon us a little more rapidly than we can comfortably take them. On the other hand, civilization has been destroyed so many times before and always through it all has the miracle of the spring occurred; the flowering followed the seed time; the harvest the flowering.

The only thing for a farmer to do under such conditions is to keep right on doing it. It's going to be quite a while before the world becomes again a wholly gay and happy place for any thinking person. But it seems to us that the American farmer of the Northeast can gaze into the future with more serene eyes than most, providing he keeps his faith in a just and merciful God and looks to his own land rather than to the vagaries of markets, economics, laws, and monetary systems to sustain him. The good soil under one's feet, the rains of Heaven to replenish it, and the sun of Heaven to warm it; a place of shelter and of storage; the fruits of the earth and of one's own labor to feed the household, with a surplus over for a neighbor — these things are as nearly timeless and changeless as anything human

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Take Time

Take time to see the beauty
Of arching sky and sunset glow,
Of color splashed o'er field and wood,
On distant hills and lake below.

Take time to hear the trill of birds,
The music in the whirr of wings,
The soothing cadence of the stream,
The symphony that Nature brings.

Take time to catch the fragrance
Of iris at the garden edge,
Of clover fields and trees in bloom,
Of incense from the lilac hedge.

In God's outdoors the waiting tasks
Will lighter grow, and fretting care
At magic touch will slip away
In the tranquil beauty there.

—Mrs. H. G. Butler,
Albion, N. Y.

ever can be. It's a good time perhaps, to rely more on these and less on cash, the store, and the can opener.

Anyway, that's the way it looks to us; but, as I said in the beginning, we've been farming only four years, and we don't know much.

Personal Problems

Only a Friend

Dear Lucile: On my sixteenth birthday I received as a complete surprise a very beautiful walnut-finished cedar chest from my parents. Ever since it has been a hobby of mine to make a treasure chest out of it—that is, to fill it with fancy work which is either given to me or that I make myself. Now I am one year older and I see myself slipping into the stage of making it my Hope Chest. Do you think this is rather a silly idea? Some girls my age have chided me because of my way of thinking.

I have a fine steady boy friend. Whenever asked about him how can I explain to my friends that he is more than just a "boy friend" yet is not my fiancé? To me he is a very true pal. You see, Lucile, I do not like that word BOY FRIEND.—Kay.

As far as I can see there is certainly nothing wrong with your filling your cedar chest with fancy work and handwork against the prospects of having a home of your own at some future time. Girls have been doing this since time immemorial and it is a very good practice.

Strictly speaking, until a young man has proposed marriage to you and you have accepted him, he cannot be termed as anything more than a friend. The chances are that your friends understand the situation and know that you and the young man are quite attached to each other, and until he actually makes a formal proposal that is all that is necessary for them to know.

* * *

Is He Too Old?

Dear Lucile: Perhaps you may think this a funny question to ask you, but I'd like to ask your advice about this personal affair. I have fallen in love with a man I have worked for for over a year. He has been talking a little about marriage, but I have hesitated because he is so much older than I. He is 45 and I am 26.

I am wondering if it would be the thing to do. Would you advise it? I have not

spoken to anyone about this matter. I didn't know what to do or say. Thought perhaps you could help me.—Uncertain.

Your own disposition and temperament may be the deciding factor in your problem of whether or not to marry a man 19 years your senior.

This is a great deal of difference, but if you are steady and settled in temperament so that you would not crave all the going and thrills and excitement which a younger man would be more likely to be interested in, also, then I should think, other things being suitable, that the difference in age need not be any great drawback. Perhaps the man is young in disposition . . . well-preserved, as we say, and actively interested in things about him, which would also serve to even the situations up.

I would advise you not to be too hasty in this . . . get well acquainted with the man and be sure that you are suited, before taking the important step of marriage.

The Song of the Lazy Farmer

ALFALFA is a right good crop except it don't know when to stop a-growin', it keeps shootin' up as thick as hair upon my pup. My neighbor's puttin' his in now, the way it piles up in the mow he'll have a lot of winter feed to fill his cows in time of need. They'll fill the milk pails to the brim and make a lot of mon for him when he can feed them, ev'ry day, a ration of alfalfa hay. He says there's no crop on his place that puts a grin upon his face like that alfalfa, for there's dough in raisin' crops that grow and grow and make two crops, or three or four; there ain't a thing that pays him more, he says, than his alfalfa field, it beats all how that stuff will yield.

I like to git my hayin' done, and when I've sweltered in the sun, I like to feel the job is o'er and I won't have to pitch no more until another year comes round to start the sprouts from out the ground.

But with alfalfa, ere you've put one crop away, from ev'ry root new shoots start up, it does its best to keep a man from gittin' rest. All season long you're makin' hay, you don't git one crop put away before another's on your heels, a feller don't know how it feels to rest from labor in the shade, he never gits his hay all made. I'd rather have a little less, than hay all summer, I'll confess, I like my timothy that gits its one crop made and then it quits.

"Now's the time for you to ask father for my hand. I just asked him for a new car!"

ALL WERE INJURED ... IN AUTO CRASH TWO HAD OUR TRAVEL PROTECTION

These Young People, All in One Family, Live at East Bethany, N. Y.

When licensed agent Charles Ingraham of Batavia, New York, called at the Wozniak home, Mrs. Wozniak arranged to insure her two daughters, Irene and Wanda—she did not include the other two children because they were not on the road so much.

This accident shows why it is best to insure all members of the family. You never know who will get hurt. You may be a careful driver, but you don't know what the other car will do to you. In this accident it is reported that a car, traveling at high speed skidded and crashed into the Wozniak car.

Usually in a serious accident, all riding in the car are injured—that's the way it happened in this accident. Because they had our travel accident protection, Irene and Wanda each received \$40.00. This at the rate of \$10.00 a week while totally disabled.

It was unfortunate the other two did not carry a policy.

After the accident happens there are always extra expenses in doctor bills—maybe hospital bills, and always a loss of time while unable to work. To help take care of these extra expenses a North American policy is a friend in the time of need.

The protection of our travel accident policy is high and the cost of this policy is low.

When renewing, most policyholders are changing to the new policy which provides extra weekly and death benefits on truck and pedestrian accidents. When you get your notice to renew, you can decide which policy you want.

PROTECTION PROVIDED BY POLICY

If the Insured shall —

1. by the wrecking or disablement of a pleasure type automobile within which the Insured is riding or driving; or
2. by the wrecking or disablement of an automobile truck within which the Insured is riding or driving; or
3. by the wrecking or disablement of a horse drawn wagon, cart, sleigh, or sled on which the Insured is riding or driving; or
4. by the wrecking or disablement of a public conveyance provided by common carrier for passenger service only (aeroplanes excluded) within which the Insured is riding as a fare-paying passenger in the place regularly provided for passenger service; or
5. by being struck, knocked down, or run over while walking or standing on a public street, public sidewalk or public highway by a moving vehicle,

suffer any of the specific losses as provided in policy on or before the thirtieth day following the date of the accident, the Company will pay

FOR LOSS OF —

Life	\$1,000.00
Both Hands	\$1,000.00
Both Feet	\$1,000.00
Sight of Both Eyes	\$1,000.00
One Hand and One Foot	\$1,000.00
One Hand and Sight of One Eye	\$1,000.00
One Foot and Sight of One Eye	\$1,000.00
Either Hand	\$500.00
Either Foot	\$500.00
Sight of Either Eye	\$500.00

WEEKLY INDEMNITY FOR TOTAL DISABILITY

If the Insured sustains injuries in any manner specified in policy which shall not prove fatal or cause loss as aforesaid but shall immediately, continuously and wholly disable and prevent the Insured from performing any and all work pertaining to any and every kind of business, labor or occupation during the time of such disablement but not exceeding thirteen consecutive weeks, the Company will pay indemnity at the rate of \$10.00 per week.

Full benefits shall apply between the ages of 15 and 59 inclusive. Between the ages of 10 and 14 inclusive and between the ages of 60 and 74 inclusive the benefits will be reduced one-half.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

WHEREVER we have a stand of clover or grass we are going to cut a good crop of hay this year. Last fall we made emergency seedings on three fields. Two of these show nice stands of alfalfa. The third is a partial failure. Even had we got only one good stand out of three, it would have paid us to sow the emergency seed we got from the government.

We plan to begin putting up grass silage on Monday, June third. We have four fourteen-foot silos, ranging in height from twenty-six to forty feet, to fill. Our stands of alfalfa and clover are so lush and rank that I feel sure it will be advisable to wilt slightly the green hay before we chop it into the silo.

We will mix in some volunteer grain when it gets in the dough stage with our clover and alfalfa for silage. And when we don't have volunteer grain available we will use from two to four quarts of phosphoric acid per ton of chopped material, according to how heavy the mixture runs in legumes, for a preservative.

If we run into a wet June and July I look for a great revival of interest in grass silage. Our own experience convinces us that excellent grass silage can be made by all of the following methods: (1) By wilting the grass to the right point; (2) by the use of molasses; (3) by the use of phosphoric acid, and (4) by the mixing in of winter grain in the dough stage.

Of all of these methods, we feel pretty sure (especially if defense measures result in higher prices for molasses and phosphoric acid) that the mixing of winter grain in the dough stage with clover and alfalfa offers farmers in the Northeast the best long-time method of making grass silage which has yet been devised.

After all, this practice is nothing but an application of the same principle which has been used for years when soybeans and green corn are mixed together to make silage.

* * *

Yellow Rocket and Mustard

When we bought our Larchmont Farm a few years ago we ran smack into our first experience with mustard. Since we bought it we have also had to contend, as have many other farmers, with an infestation of Yellow Rocket.

Our first move after we realized what we were up against was to find out whether or not mustard seed which went through a silo would germinate. No one at the College of Agriculture could answer this question, so we tried out some seed and found that it apparently would not grow after being subjected to the heat of ensilage.

This fact gave us one cue as to how to control both mustard and Yellow

The picture at the right shows how we have rigged up a sixty-dollar truck with a machine for dusting cereals — wheat, barley, and oats — with sulphur to control mildew and rusts. The above picture shows the forty-foot dusting boom set for dusting. The truck is driven very slowly across the field and does surprisingly little damage to the grain. Research work to date indicates that even at present price levels dusting cereals may pay substantial dividends in increased bushels of sound grain to the acre.

Rocket and I think that we have gained on both weeds through making crops which were infested with them into silage.

Since ensilage could not be the answer, however, to control mustard in spring grain we also became interested two years ago in methods of killing mustard and Rocket. Last year we got some experience with both a wet spray and a dry dust and found that we killed ninety per cent or better of a mustard stand with both methods. This year we are repeating the experiment. I am afraid, however, that both battles

These pictures are of the same horse, Tony C, which has been around Sunny-gables for a good many years now. They were taken one-half hour apart and illustrate quite dramatically the transformation which can be made in the appearance of a saddle horse with a pair of clippers and an oily cloth.

will have to extend over a number of years, as I find that Yellow Rocket seed lives over for years in the soil. The plant was originally a native of Europe and was undoubtedly brought into the United States in imported grass seed.

Seedsmen tell me that Rocket seeds are easily cleaned out of all the clovers, but that it is a difficult job to separate them from timothy. Locally

grown and poorly cleaned timothy seed can very easily be a carrier of Yellow Rocket seed.

Sometime this fall I will report more fully on my success in controlling Yellow Rocket and mustard by making grass silage and by spraying or dusting fields in which there are bad infestations of these two weeds.

* * *

Coming Back

I am in receipt of letters from two farmers who are very good pasture men. The observations of the writers of these two letters check with my own.

Three weeks ago, my informants tell me, they were terribly discouraged by the appearance of their pastures and by what seemed to be the total absence of wild white clover. Now, after three weeks of good growing weather, a plentiful scattering of minute wild white clover plants is showing up. These are just the conditions I have observed in my own pastures.

We have five pastures ranging in size from fifty to one hundred acres and totaling three hundred acres. Each of the five pastures connects with a basement barn with running water. We are darkening all of these basements and by placing salt in them are encouraging the livestock in the pastures to seek shelter in them from flies and the heat of the day.

Down Mexico Way

By H. E. BABCOCK, Jr.

May 23, 1940.

Yesterday we had over an inch and a half of rain which not only has stopped all tractor work but also all irrigation. Most of the irrigation pumps are run by natural gas or Diesel engines which can be heard droning all through the night and day. With both these motors and the tractors taking a rest the resulting quiet is most noticeable.

As usual, the rain has both its disadvantages and advantages. The money saved in irrigation, however,

will more than offset all other losses. We were caught with about twenty tons of oat hay in the windrows, which will not suffer as much as would alfalfa. It has dried rapidly today and with a clear day tomorrow it should be ready to bale by noon.

I remember now that I reported rain the last time I wrote. This may give some the impression that it is not as dry here as it might be, and that irrigation is unnecessary. The hot sun and almost constant wind here, however, serve to dry out the top moisture very rapidly. Only tap rooted plants can go without irrigation for any length of time, and then only if there is plenty of moisture below the furrow slice. The rain we have been having this spring is looked upon as quite unusual by the natives. As a rule, only thunder showers which do not even stop the baler are expected.

Before cutting the oat hay, which we will finish tomorrow, we put up 44 tons of first-cutting alfalfa from a neighbor's field of 53 acres. Since we were interested in finding out just how much this hay cost us in addition to the five dollars a ton which we paid for it, I kept complete records on the whole job. For a total of seventy-five dollars the 44 tons of hay were mowed, raked, baled, and stacked in the barn three-quarters of a mile away. All of the operation was done with our own equipment, with the exception of trucking and stacking the hay in the barn. This was done by a trucker at a cost of fifty cents a ton, based on three tons per one hundred bales. The baler charge was put at twelve cents a ton, exclusive of labor. This charge is based on the old steel wheeled baler costs which should be reduced some by the rubber-tired baler we are now using.

The rain made the cotton, which we had to replant, fairly jump out of the ground. The first planting on one field came to such a poor stand that we felt it necessary to replant. Lack of moisture in parts of the field, together with poor seed, which had been injured in the de-linting process, seemed to be the cause of the poor germination.

A Bad Investment

"Thirty years ago I was a school teacher, and was persuaded to put my savings of \$400 into the stock of a company manufacturing Vitamin Foods. Once I received a 50c dividend. I am enclosing their yearly statement sent me. Please investigate them and see if I shouldn't be getting more or sue to get my money back."

Many heartbreaking experiences would be avoided if small investors understood the fundamentals of investing money. Once you buy stock it is your property and if the company makes no profit you naturally get no dividends. If you buy stock that is listed on one of the stock exchanges, you can always turn it into cash at the market price, but when you buy unlisted stock there is no sale except to another individual, and he is unlikely to buy any stock that is not paying dividends. For every person who invests in a new concern that develops into a big money maker, thousands invest in firms that go broke or struggle along without paying dividends. There is also the possibility of buying stock that is definitely fraudulent.

* * *

Don't Do It

"In the past I have entered a lot of advertising contests, although I have never won any. Recently I saw an ad from a company that claimed to write contest entries, which made me wonder if the contests are on the level and if the concerns that write entries are reliable. The concern I mention charges a \$10. service fee for entering five contests."

The vast majority of advertising contests are sponsored by nationally known manufacturers and are absolutely on the level. The idea of starting a business concern to write contest entries is a new one to us and frankly, it leaves us un-enthusiastic.

First, it is obviously impossible for such a concern to win for everyone. Second, it seems that this idea is de-

cidedly lacking in good sportsmanship and if any considerable number of contestants should have their entries written in this way it might well bring such advertising contests into disrepute, thus spoiling something that brings pleasure, and occasionally profit, to a great many people. Third, if this business is so good why don't they enter the contests themselves under their own name and win all the prizes? The logical conclusion is that they find it a lot more profitable to charge for writing the entries.

By all means enter all the contests you wish—it's a lot of fun and there is always a chance of winning. But, by all means, write your own entries.

* * *

Sucker Bait

The Black Fox Magazine takes a timely and healthy crack at concerns who advertise astounding profits in fur raising. They point to one which says, "RAISE MINKS. \$25.00 pelts cost \$2.00 to raise."

The editors use vigorous language and describe such ads as "sucker bait." They state that with average luck a good man at raising mink might figure his cost per pelt as \$8.00, and state further that the average price at a recent big auction sale was between \$10.00 and \$11.00 for mink pelts. That gives a decidedly different and more conservative angle to the situation.

We believe that there is a real future in fur farming, and that fantastic claims bordering on a "get-rich-quick" proposition will do as much as any one thing toward giving fur farming a black eye.

If you are interested in fur farming, start in a small way and study the business from every possible angle. You will find just as many headaches as there are in any other livestock breeding proposition; but entered into on a sound basis, it has possibilities.

* * *

Gas Tax Refund

On this page in a recent issue we referred to the new regulations covering securing tax refunds for gas used on New York State farms. In that item we reported that it was necessary to report the number of hours which equipment was used.

We now learn that the State Department of Taxation and Finance at Albany has discontinued the use of the refund application containing a column for reporting the number of hours machinery was used, and a new form has been substituted. Most Farm Bureau offices have these refund application blanks, or they can be secured by writing to the State Department of Taxation and Finance, Albany, New York.

* * *

I am wondering if there is an elderly couple or middle-aged lady somewhere that would be interested in doing light housework on a pleasant farm for two adults for board and room. I thought there might be some neat and pleasant person somewhere who had a small income of some kind not large enough to pay board and room and other expenses and without any home who would like such an opportunity. We would treat her as one of the family, and our home is pleasant and has modern conveniences.—Mrs. C. M.

If anyone is interested, write C. M., c/o American Agriculturist, Box 367, Ithaca, N. Y., and we will forward the letter.

* * *

A subscriber at Liberty, Sullivan County, N. Y., offers a home and some remuneration for a young woman to help with housework and the care of two children. If you are interested, write H. Z., American Agriculturist, P. O. Box 367, Ithaca, N. Y.

Let Us Help You

THE following Home Service bulletins have been prepared by American Agriculturist's Home Editor, Mrs. Grace Watkins Huckett, and are available to any reader without cost other than 3c each to cover mailing and mimeographing costs:

- ☐ No. 1—OUTDOOR FIREPLACES. How to build them.
- ☐ No. 2—BLANKETS. Selecting, washing, and moth protection.
- ☐ No. 3—APPLE RECIPES. Your family will like these.
- ☐ No. 4—PROTECTIVE FOODS. Good health for the family.
- ☐ No. 5—SCHOOL LUNCHES. Healthful, appetizing, easy-to-prepare school lunches.
- ☐ No. 6—HOME CANNING AND CURING OF MEATS. Directions are easy to follow.
- ☐ No. 7—CHOPPED MEAT RECIPES. Tasty, economical meat dishes.
- ☐ No. 8—BUYING A WASHING MACHINE.
- ☐ No. 9—TEMPTING WAYS TO SERVE EGGS. Excellent recipes for serving eggs as the "main dish" at any meal; also, egg salads and desserts.
- ☐ No. 10—HOMEMADE JAMS AND JELLIES. This bulletin will help you to have success with jams and jellies. Directions are easy to follow, and a number of Mrs. Huckett's famous recipes are given.

How to order these bulletins: Check those you want, include 3c for each one desired, and return this coupon to American Agriculturist, Box 367-H, Ithaca, N. Y.

CUT DOWN RUNNING EXPENSES BY USING ESSO PRODUCTS

THOUSANDS OF FARMERS are saving money. They've discovered that Esso fuels and lubricants give the kind of power and protection they need.

That's important to your profits. It cuts repair bills to the bone and ups profits.

Tractors and trucks powered and lubricated by Esso products get work done quickly and easily. And the family car delivers satisfying mileage and power.

So follow the lead of your fellow-farmers. Prove the protective toughness of Esso lubricants. Call for Esso Tractor Fuel. Try one of the two new gasolines now sold by your Esso Dealer.

New ESSO
Regular in Price, it actually meets premium specifications for anti-knock. A powerful favorite for trucks, tractors or the family car.

New ESSO-EXTRA
The finest gasoline ever sold by the world's leading petroleum organization. Absolute tops for extra quick starts...extra fast pick-up...and extra quiet operation.

ESSO MARKETERS

COLONIAL BEACON OIL COMPANY

Egg Cooler—The problem of cooling eggs quickly without losing moisture is solved by Abram Moll of Williamson, N. Y., with this simple, home-made cooler. The board rack rests on two-by-fours on the dirt floor which is kept well soaked with water. The fan drives the cool, moist air between and around the eggs, cooling them quickly while maintaining humidity

Protect Potatoes—When potatoes are about 6 inches high, commercial growers start spraying. Smaller growers who do not have spray equipment can do the job with dust. The first dusting should protect against blight. An 80-20 lime-monohydrated copper sulphate dust will do it. If there is any sign of bugs, use a 60-20-20 lime-monohydrated copper sulphate-calcium arsenate dust.

GOOD RAINS THIS SPRING have restored many meadows and pastures which last fall seemed hopelessly damaged by drouth. In some places additional crops may still be needed to balance out next winter's haymow. Here are some suggestions:

SUDAN GRASS

An excellent emergency hay crop which can be planted about a week after corn. Sow 25 pounds per acre. Hay stage is reached 75 to 80 days after planting. Sudan Grass may be cut twice, first as soon as the heads appear and again 5 or 6 weeks later. Do not feed Sudan Grass after frost. Approximate seed cost per acre—\$1.25 to \$1.50.

SUDAN GRASS AND SOYBEANS

Sow soybeans through the grain hopper at 45 pounds per acre and sudan grass through the seed hopper at 10 to 15 pounds per acre. Sow early in June. Hay stage reached about same time as sudan grass alone. Approximate cost per acre—\$2.50 to \$3.50.

SOYBEANS

Where land grows good legume hay, an early maturing hay can be made of Manchu or Dunfield soybeans. Wilsons may be used but they mature later. Sow 2 bushels per acre. Cut for hay when the pods are forming. 75 to 90 days to hay. Cost per acre—Yellow Beans, \$4.00 to \$4.50; Wilsons, \$3.00 to \$4.00.

JAP MILLET

On late wet soils, Jap Millet will make good yields. Plant any time in June. Rate is 30 pounds per acre. 75 to 80 days to best stage for hay. Cost per acre—\$2.10 to \$2.25.

HUNGARIAN MILLET

Can be planted as late as July 10. Does better on moist, rich soils. Foxtail Millets should not be fed to horses. Cost per acre—\$2.00 to \$2.50.

CUTTING HAY EARLY will prevent weeds from going to seed. But many seeds will mature even after the hay is cut. Few weed seeds will survive fermentation in the silo, however, so it may be advisable to ensile a weedy hay crop instead of curing it. Grass, legumes, or small grains for silage should be cut early and put in the silo quickly with molasses or Silo-Phos. Care should be taken to cut hay with sufficient moisture content. 66% is desirable. Cornell Bulletin No. 391 gives simple directions.

GRAIN PRICES BROKE SHARPLY at the start of the Blitzkreig. Up to now they have shown no signs of recovering, but it is certain that the government will do everything possible to keep them from breaking further. By-product prices are always a little softer at this time of year due to lack of demand. Although anything can happen under war conditions, there is nothing in sight just now to indicate higher feed prices.

Weighing Mountains in wheelbarrows. That is what has been going on in nine point-of-use G.L.F. Fertilizer plants. Combined fertilizer, lime, and superphosphate tonnage moved to farms in the New York Milkshed through these plants this year totals nearly 200,000 tons! Mixed fertilizer and superphosphate to date is more than 80,000 tons and there are still beans and buckwheat to fertilize before the fiscal year is finished July 1.

Buckwheat in manured rotations will call for 300# of 20% Gran-Phosphate to the acre; on land not manured 150# of 5-20-5 or 5-20-10. Market snap beans need 600# of 5-10-10 on sandy soils; 400# 6-18-6 on silt loam. Canning crop beans can be grown with less fertilizer; 300# of 5-10-10 on sandy soil and 200# of 6-18-6 on silt loam.

The men pictured here checking fertilizer mixtures for accuracy are on the job right up through the time the last pound is put on this year's crops.

THE FARM PAPER OF THE NORTHEAST

Showing one yellow rocket plant taken from the alfalfa field on H. E. Babcock's Sunnyside farm on June 3. Note the many branches of the one plant, each with its possibilities of producing thousands of seeds. Mr. Babcock was meeting the rocket problem in this particular field by putting the alfalfa in the silo, where the heat and acid will kill the rocket seeds.

Yellow Rocket is on the MARCH!

By E. R. EASTMAN

meadows, or anywhere. In recent travels I have seen many farmers in the fields pulling rocket by hand, and in some cases at least this looked to be a hopeless task, like trying to push back the sea with a broom.

Why Rocket Spreads Rapidly

This weed is what is known as a winter annual, that is, it commonly germinates in the fall and appears then as rosettes of waxy leaves—see drawings on this page. It comes on early in the spring. It can also germinate in the spring, and sometimes it is even a short-lived perennial, living for two or three years.

Like all bad weeds, rocket seed is very viable (full of life). Talk about a cat with nine lives! Rocket has a thousand. That is one reason why it persists under all kinds of conditions and why it is hard to control.

Another reason why rocket spreads so rapidly is the vast number of seeds which one plant can germinate. A single mustard plant—and rocket belongs to the mustard family—has been found to produce more than 500,000 seeds in one season! So viable is rocket seed that it can remain dormant for many years in an unfavorable soil and then suddenly spring to life. That is what happened this year. The dry weather of recent years prevented it from germinating, but this spring it has yellowed vast acreages because there is so much moisture.

How Rocket is Spread

Before any program of control for rocket can be decided upon, it is first necessary to know how this pest is spread. Here are some of the ways that rocket travels on to new farms and new meadows:

1. Through grass seed mixtures.

Poorly cleaned alsike and timothy seed, and so-called "bargain mixtures", are the worst carriers of rocket seed. A farmer cannot buy

such seed and then hope to clean it for himself, for a fanning mill cannot get it. There is very little rocket seed in good grades of seed.

2. Rocket seed is spread in farm manure from livestock fed with hay which contains the seed.

3. Rocket travels along the fences from farm to farm and from meadow to meadow, and is frequently carried from farm to farm by way of ditches.

(Turn to Page 10)

1. Yellow rocket seed much enlarged. One plant produces thousands of these.
2. Base of yellow rocket plant, showing appearance in early spring of the third year, showing part of the dead flowering stem produced during second season and rosettes which will produce flowering stems during third season.
3. One branch of the yellow rocket plant loaded with seed pods.
4. Complete yellow rocket plant in blossom early in second season.

ALARMED at the rapid and dangerous march of an enemy right on thousands of northeastern farms this spring, a war council was held here at Ithaca a few days ago to set up a defense. No, I am not talking about the latest World War, but of an enemy that is on the march right here on our eastern farms—winter cress, commonly known as yellow rocket. Many farmers are calling it mustard, but while it is a member of the mustard family, yellow rocket is not mustard, and in fact is harder to control and more damaging. Mustard can be and is being controlled, but yellow rocket is spreading fast and this year alone will take a toll of hundreds of thousands of dollars out of the pockets of northeastern farmers.

If you think I am an alarmist, or if you don't believe that rocket is a dangerous pest, travel almost anywhere in the farm country this spring and notice the thousands of fields infested with it, some of them just a solid mass of yellow, leaving little or no chance for grain or hay to grow. It is worse in new seedings, but you can see it this spring in pastures,

It's Time to Cut Hay

By E. S. HARRISON*

ALFA and clover, for best quality and highest yields, should be cut when about one-half in full bloom. Timothy should be cut just as it comes into its first bloom. These are the ideal stages of maturity for cutting and is the stage at which to cut if the entire crop can be cut in one day. This, however, is seldom if ever possible. In the operation of our dairy farm, we plan to start our hay harvest so as to be approximately half through when the hay reaches this ideal stage. By following this practice we get the largest amount of the hay close to the ideal stage. Cutting in advance of the ideal stage produces a slightly higher quality of hay, but usually results in somewhat lower acre yields. This loss in yield is frequently offset with a heavier second cutting so that from a management point of view it represents a sound practice.

Follow the Weather Forecast

Too many dairymen make the mistake of not cutting down enough hay at one time. My father always told us, when we were inclined to question the amount of hay he was cutting down, that, "you have to cut hay down before you can get it in." I can now fully appreciate the significance of his statement, although at the time we sometimes wondered about it.

In our present haying operation, we play the weather forecasts rather heavily. If fair weather is predicted for the entire northeastern United States, we cut down a lot of hay without stopping the mowers. On the other hand, if the forecast is for rain we cut only a very small amount. By following this practice we have, over a period of eight years, gotten more than 80% of our hay in without any weather damage.

Putting Hay in the Silo

If a dairyman plans to put up any hay silage, I think that he should make dry hay whenever the weather is favorable, and save the hay silage job for unfavorable weather conditions. We plan to set up a hay chopper at one of the silos so if we get caught with a field of hay, we can go right ahead and put it into the silo. The idea that the early season is always unfavorable to hay-making is not correct. In many cases we get some very favorable hay weather during the latter half of June. This favorable weather is then frequently followed by rain.

How We Do It

We cut our hay and allow it to wilt in the swath. This wilting is important because when the hay is raked, the top of the swath becomes the center of the windrow and is not again exposed to the sun. It should not be left in the swath long enough to dry sufficiently to result in a leaf loss when raked. Further, in the early season when the ground is moist the hay acts much like a blanket spread on the ground. The sun on the top of the swath will cause moisture to be drawn from the ground which will condense on the hay next to the ground. It should be remembered also, that the passage of air through the hay is as important a factor in curing hay as is the action of the sun. Heavy hay lays so close to the ground that there is practically no air passage through it. This is another strong argument for putting hay into a windrow as soon as it has wilted on top.

In heavy hay, we never rake more than one mower swath into a windrow. If the full length of the side-delivery rake is used the windrow

becomes so large that it is practically impossible to get it cured in the center.

Turning By Hand

As soon as the windrow is cured on top it should be given a half-turn so as to expose the hay next to the ground to the sun. If a side-delivery is used to turn hay that has been raked into a single mower swath windrow, the hay must be turned a turn and one-half, which winds the hay too tight as well as knocks off leaves. For these reasons we turn practically all of our hay by hand. This practice does not require as much time as one might think. A man can turn a windrow with the back of a fork about as fast as he can walk. In addition to simply turning the windrow he also can shake out the heavy bunches and prevent these uncured rolls from going into the barn. By moving the hay frequently during the curing process, uniform curing is obtained and leaf loss is reduced to a minimum.

Hay should not be put in the barn containing more than 25% moisture, and 20% is much safer. At this level of moisture the entire hay plant is fairly dry and the stems will tend to break when twisted rather than form a rope.

High-quality hay results from a good stand of desirable hay plants which are cut early and sun cured in such a way so as to preserve a high degree of the natural green color of the growing plant, with the smallest possible loss of leaves.

"When" Most Important

The stage of maturity at which hay is cut and the harvesting methods employed are more important than the kind or variety of hay grown in determining its feeding value.

The above statement is based upon actual experiments conducted at Cornell University. Professor Morrison and his associates found that milk and fat production was equally well maintained when high-quality first cutting alfalfa hay was replaced with early-cut timothy hay, harvested from well fertilized land. Professor Savage, myself and our associates found that growing dairy heifers consumed as large

amounts of early-cut, timothy hay as they did of high-quality, first or second cutting legume hay. The rate of gain was also equally rapid, on the early-cut timothy. Obviously, it was necessary to add calcium to the concentrate mixture of the heifers on the timothy hay ration to guard against a mineral deficiency. A similar group of heifers fed on late cut weathered, first cutting alfalfa hay averaged to consume only 60% as much hay as the group receiving the high-quality hay. Another group of heifers fed late cut timothy hay also failed to consume more than 60% as much hay as the group of heifers receiving early-cut timothy.

In every case the lower hay consumption was accompanied by a marked drop in the growth rate. During the latter half of this experiment, the concentrates fed to the heifers receiving the poor-quality roughage was increased sufficiently to bring their total digestible nutrient consumption up to the same level of the heifers receiving the high-quality hay. This marked increase in concentrate feeding did not prove sufficient to bring their growth rate up to normal. We concluded that continued feeding of low-quality roughage results in a nutritional deficiency that cannot be corrected by increased concentrate feeding. In other words, high-quality roughage supplies to the winter ration of growing dairy heifers certain nutritional factors that are essential for normal growth and development.

These findings should be of great importance to dairy farmers. First, they definitely emphasize the importance of high-quality hay. Secondly, they point to the fact that any dairyman, regardless of location or soil conditions, can produce a satisfactory grade of feeding hay if proper attention is given to time of harvest and harvesting methods. It should not be concluded that non-legume roughage is equal in every respect to legume roughage. The legume roughage, if properly harvested, will be higher in protein, calcium and vitamins A and D, than the non-legume roughage.

EDITOR'S NOTE: The importance of putting up hay in good condition is being recognized as never before. If you wish more information about hay, write your State College of Agriculture for a list of available bulletins and send for those on hay.

You will find that many manufacturers of farm machinery have booklets that give valuable hints.

Beekeeping . . .

A THRILLING HOBBY and MONEY-MAKING SIDELINE *By*

*EARL HODDER

EVERY normal individual, regardless of age, needs a hobby. If you are thrifty and want to keep expenses to a minimum, consider beekeeping, a hobby where expenses are turned into profits.

Regardless of how you make your living, you can fit beekeeping into your schedule; but in addition to the fun and profit involved, the keeping of bees has other advantages to a farmer. Some crops (including fruit, buckwheat and cabbage for seed), require cross-pollination for best results, a job which the bees gladly do without charge.

HOW TO START—To avoid starting with the handicap of diseased colonies, it is inadvisable to buy second-hand equipment and bees. I suggest the purchase of package bees from the South to arrive just before fruit trees begin to blossom. The names and addresses of persons supplying package bees and firms selling hives and equipment can be obtained from any bee journal and instructions for installing the bees in the hives will come with the package. For each colony you plan to start you will need to purchase a two or three pound package of bees with a queen, putting each colony in a ten frame standard hive with metal cover.

LITTLE CAPITAL NEEDED—Each hive and super with package of bees will cost about ten dollars. The minimum additional equipment you will need includes a bee veil, a smoker and a hive tool, which will cost about three dollars; and perhaps a section press and a unit of the Multiplex foundation fastener, which will add another dollar to your investment. Therefore, if you are starting with one colony, the cost will be about fourteen dollars, and ten dollars more for each additional colony. Buy your hives and supers during the winter months, or at least before April, so you can have the new home all ready when the bees arrive. By all means subscribe to a good bee journal and buy a good book on beekeeping to which you can refer when problems arise.

HOW TO MARKET — With reasonable care in an average season, your returns should come close to equalling your investment. You may find it possible to barter honey for groceries or to make an arrangement with your grocer for selling honey, and you will find that neighbors will be ready customers. If you have a roadside stand, your problems are practically solved. If you do not, you may be able to arrange with a neighbor who does have a stand to handle your product.

YIELD PER COLONY—The average yield of comb honey is 30 sections. The yield varies with the season, strength of colony at time of the honey flow, and the amount of necessary work given by the beekeeper. A yield of 51 sections was obtained from one colony this past season, but 134 were secured last year which was a better honey flow season. The writer has received as high a yield as 228 completed sections from one colony. Package bees should not be expected to give as high yield during the first season as full strength ten-frame colonies.

DO NOT NEGLECT—During periods when there is an unusual demand on the farmer's time, such as haying, it is easy to neglect the bees. Little time is required to handle a few hives, but when attention is needed, the work should be done promptly. Occasionally correct winter protection for hives is installed too late or not at all. This work should be done in the early fall, and it is not advisable to disturb the colonies during the winter to give them protection. If this protection has been omitted, the size of the entrance may be reduced with a block of wood and some form of spring protection may be provided about the middle of March or the first of April.

The colony must maintain a temperature of about 57 degrees or better during the winter. The eggs of

The rear part of the garden is a favorable spot to locate hives.

the honeybee hatch at a temperature of about 93 degrees, and this temperature may be harder for the bees to secure during the cold spring months than the wintering temperature. It is for that reason that spring protection is very essential.

Other jobs which must be done when needed are spring feeding and the uniting of weak or queenless colonies. The preparation of hives for swarms and supers to receive honey are jobs that can be done during the winter months. When supering is delayed, honey yields are sure to be reduced. Bees have an irritating habit of swarming on the busiest days; but with some effort and loss of time from other tasks, they are usually successfully hived. Generally if this same amount of time and effort had been given to the bees a few weeks earlier, there would have been less swarming. The cause of swarming can be summarized in one word—dissatisfaction. Lack of attention from the beekeeper may help in making the bees

Honey is not the only rent paid by bees. Cross pollination of fruit and some other crops is important.

While caring for bees requires little time, they cannot be neglected without serious loss.

dissatisfied which certainly will result in less honey production.

The duties and actions of the three different kinds of bees within the hive have always fascinated me. In a normal colony the queen lays all of the eggs. When she approaches a drone cell, which is a quarter of an inch in size, she lays a drone egg. If the next cell is one-fifth of an inch in size, she will deposit a worker egg in the base of the cell. Although the drone egg has not been fertilized, it will hatch and develop into a drone bee. The drone is the male bee.

The food eaten by the drone during the summer, which is the time of plenty, is not greatly missed by the workers; but they object to the drone's remaining within the hive during the winter months. As fall approaches and the winter stores are being consumed, the workers object to having the drones enjoy the food which they have

worked so hard to obtain. When the drones attempt to enter the hive, the worker guards make it known to them that they have already consumed their last meal. The drones succumb to starvation. The workers truly live up to the name which has been given them. They secrete wax, build comb, feed the young bees (brood), keep the hive warm or cool, gather nectar, pollen, propolis and water, guard the entrance against intruders, seal cracks and smooth surfaces with bee glue or propolis (which they gather from gum and buds of trees), ventilate the hive, evaporate the moisture from the nectar and ripen it into honey.

If a colony becomes queenless and no eggs or brood less than three days old are present, the workers will start laying eggs. These workers do not mate with a drone and produce only unfertilized eggs which hatch into drones. Therefore the colony is unable to maintain itself, for after the worker bees die off, there will be no bees within the hive with the ability to feed the young bees. Furthermore, there will be no bees (workers) to gather nectar and make honey.

The queen has a sting, but she never uses it except to kill a rival queen. The writer has placed two newly hatched queens under a glass tumbler to observe the royal battle. Occasionally, only a few seconds are required before one queen is dead. Never has it been observed that both queens die as sometimes occurred when duels were fought. It is claimed that each queen will stop when she realizes that each of them will give and receive a fatal sting. They will shift their position, as wrestlers do, so as to secure a better hold upon their opponent. There appears to be no end to the mysteries and enchantment which a colony of bees can bring.

Give a pig when he grunts and a child when it cries, and you will have a fine pig and a bad child.—*Old Country Saying.*

The Miracle of the Leaves

READING the Bible as a boy, I used to wonder why all the miracles happened way back in Bible times, and to wish for some great miracle to happen in my own lifetime.

Well, miracles do happen now. Trouble is, most of us "have eyes to see and see not; ears to hear and hear not." I never thought anything about it as a boy, but now every spring I think of the miracle of the leaves. During the long winter we see nothing but the bare branches of the trees, and then suddenly

"Every clod feels a stir of might,

An instinct within it that reaches and towers
And, groping blindly above it for light,
Climbs to a soul in grass and flowers."

Mix a little sunshine with some warm rain and up into the barren trees flows the life-giving sap, and then, within a few days, bursts forth the miracle of the leaves in all their billion different shades of green, so numerous that even to count them on one tree is an impossible task; all alike and yet all different.

Then, when it is time for change, God subdues the green of the leaves, and brings out vivid colors beyond the imagination of Little Man, so that our hills and valleys shine forth in all the glory of His handiwork. Miracles! What miracle was ever more wonderful than the Miracle of the Leaves?

Millions for Defense; But Not One Cent for Waste!

A PROMINENT non-partisan leader said to me recently that if our government had not spent so many billions wastefully and inefficiently there would now be more money for national defense without crippling business, farmers, and the nation by taxes. Few real Americans are now objecting to spending money for defense, but many are worrying, fearing that it will not be well spent.

It's too late to save what has been lost, but in this real emergency a tremendous responsibility rests on the shoulders of every government official, every leader, and every citizen to see to it that the Federal, State and local government economize and cut out many unnecessary services in order to concentrate upon the real job which lies before us.

If we go on piling up public debt, if we go on rapidly increasing taxation, making no economies anywhere, there can be but one end—that is, revolution and general breakdown. The sooner we recognize that the better.

Apple Men Must Depend on Themselves

"We have long loved our cider apples, our culls, our moth-eaten junk and windfalls with a perfect mother love so deeply that it wrings drops of blood from our hearts to keep them out of packages and off the fresh fruit market. Evidently it will take a world war to overthrow this affectionate love. If so, that may be one good thing from a bad war."—R. G. Phillips, Secretary, International Apple Association.

APPLE growers need not be reminded of what the loss of the export trade due to the war has done to them. It may be well also to remember not to build any false hopes on what the war may do to help apple growers in the

future. It is very possible that the Allies will have to turn to American farmers for some necessities of life, but they can and will get along without apples. It is possible, of course, that a general inflation caused by the war will raise the price of everything, including apples.

But, as Mr. Phillips points out, any help that the apple growers are likely to get must come from their own efforts, the first of which is to keep the culls from ruining the market. More and more efforts also must be given to packaging and to doing everything possible to direct attention of the consumer to apples, particularly the high quality kind we grow here in the Northeast. Leaders of the Industry are thinking and working on the problem now as never before. They cannot get far without the help of the man who is growing the apples.

Congratulations, Jimmy!

SOMETIMES folks do really get around to shooing a man a few well-deserved flowers while he can appreciate them. That is what is going to happen to Professor James E. Rice—"Jimmy" to you—on June 29, when the poultry building at Cornell University is to be dedicated as Rice Hall. It will be the first college building in the country to be named in honor of a poultryman, and that honor is richly deserved. Better come!

To Professor Rice more than to any other man goes the credit and honor of turning the farm job of keeping hens into a great modern business based on science. Professor Rice came to Cornell as the first professor of poultry husbandry in 1903, retiring in 1934. That, so far as I know, was the first poultry course in America. See picture on Page 10. In the thirty years that he was head of the poultry department, Professor Rice laid the foundations to the poultry industry as we know it today.

Jimmy Rice is known the world around not only for his great contribution to agriculture, but for his enthusiasm and leadership for all that is good. With all the others, we add our own best wishes and congratulations.

"Seeing the Fair" at the Hartford County, Connecticut 4-H Fair. Doesn't it just naturally bring back your memories of old-time fairs and circuses?

Don't "Ride" the Cultivator

I WORKED for a farmer once who always insisted that I must pile a lot of heavy rock on the one-horse cultivator in order to "stir the dirt deep." Father had that idea too. I can see him still bearing down on the cultivator handles for all he was worth, and he told me once when we were sawing wood that it was all right to "ride" the cultivator but not the crosscut!

But they tell us now that deep cultivation is worse than no cultivation, because it cuts off the crop roots. After years of experimentation, the scientists are sure that were it not for weed control there should be little or no cultivation. But there's the rub. Frequent cultivation is the only way we know now of controlling weeds. In order to meet the other problem of cutting roots, cultivation should be just as shallow as you can make it and get the weeds. The time to get the weeds, of course, is when they are small.

Another wrong idea that we used to have was to stir the soil soon after a light rain in order to save the moisture. The right way is exactly opposite. Cultivation should be delayed until the moisture has a chance to soak in.

More Research---Less Schemes

"In my opinion, the most important aid that a State can extend to its agriculture over a long-time period is through the support of experimental work to solve the hundreds of complicated problems that confront a highly diversified and modern agriculture."—From a Speech by Lt. Gov. Charles Poletti at New York Agricultural Experiment Station at Geneva, May 14, 1940.

RIGHT! If some of the millions wasted on government schemes to help farmers could have been used to increase research, particularly along marketing lines, farmers would be far better off today.

Give Onions a Break

OF ALL the forgotten products of the farm, onions are at the bottom of the heap. Although one of the best foods in the world, they never get much but knocks.

Maybe the onion growers themselves are to blame for taking it lying down. They should do something about it, for many farmers depend upon onions for income, and a lot more consumers could use them with benefit. Give us the facts and we will help.

Eastman's Chestnut

ONE OF the best stories that has come along in a long time is a true one about Ezra Cornell, founder of Cornell University.

Mr. Cornell was very patriotic, but too old to bear arms at the time of the Civil War, so he did everything else he could think of to help. Among his activities, according to the Ithaca Rotary News, was a contribution of \$50 to the Ithaca Ladies Volunteer Aid Association. He offered the ladies of that organization a prize on condition that twelve of the members would work for an entire afternoon without speaking a word! The women accepted the challenge, and the Ithaca Journal of January 20, 1864, relates that they won. Admitting his defeat, Mr. Cornell said:

"The unprecedented fact seems to be clearly established that a dozen or more ladies can meet together and perform a day's labor without uttering a word. I think that this is the first time in the history of the race that this unnatural and difficult task has been performed. So I most cheerfully hand over my check for \$50."

Well, anything *could* happen once!

Prepare for Trouble Now

I WRITE this during the most fateful days in the history of the modern world. Norway has made peace with Germany. The English have met with disaster in Flanders, and Belgium and the Netherlands are in the hands of the Germans. Each day the splendid French army is forced backward step by step, outnumbered and ill-equipped to stand the terrific pressure.

There is still some hope for ultimate victory by the Allies, but even so, we face difficult times ahead, the like of which Americans have never known. It takes a long, bitter time to get over any war. The bigger the war, the harder the recovery. All of our troubles of the past ten years came from the first World War. But look at the world now! Millions in both Asia and Europe are on the march, more millions not actually fighting have left constructive employment for war work. There is grave possibility that great famines and uncontrolled disease may rage across Europe, as in the Dark Ages.

Nor will America escape. Added to government expenditures, much of which have been unwisely spent, are necessary more billions for preparedness, which will mean taxes of a size we never dreamed of. These taxes in turn may eventually slow down business, increase the cost of living, and throw men out of employment. That might lead to revolution and dictatorship. With Germany in control of Europe, we can expect that she will control the trade of both Europe and South America. That will mean that America will have to become entirely self-contained, or play ball with Germany on Germany's terms.

But, for a time at least, from the dollars and cents standpoint, all may go well. Prices will go up, including farm prices. In fact, we may have a wild disastrous inflation, because our weak monetary system cannot stand the pressure of such heavy government spending. Then, when the bottom falls out, be it one year, or three years, or five years from now, when the time comes that we begin to pay for this world spree, then we may have hard times that will make the past ten years look like a grand period of prosperity, unless we can get in shape to meet the crisis.

So much for the dollars and cents side. From a political and social side the situation may be even worse, for we stand a good chance to lose the liberties for which Anglo-Saxon people have fought and sacrificed since the days of King John and the Magna Charta a thousand years ago. We are already on this road to lost liberty. To carry on the war in England, the British government has been delegated absolute power. Gone are all the privileges which the English freeman has held dear for these many years. On this side of the ocean, we have seen this change coming through over-centralization of our own government, until it has reached the point where we may lose the liberties of a democracy under the excuse of trying to save it.

Well, that's a sad picture, but we may as well face the facts. Thank God, it is not too late on this side of the Atlantic to look at some of the facts and to do something to avert disaster. What can we do?

First: We can prepare both as a nation and as individuals.

The President of the United States is right in his insistence on adequate national defense. Where he may be wrong is in too much confidence in his own ability and the ability of some of his advisers to spend efficiently the billions which he demands for defense. The President's War Board, headed by a successful business man, is a wise move, providing the President gives the business men on that Board leeway to operate.

Second: Disaster can be averted or at least prevented in part by correcting our monetary system immediately.

With a dollar based on many commodities instead of on gold alone, and under the wise guidance of a monetary Board of Judges, both wild inflation and disastrous deflation could be prevented and prices kept more on an even keel.

Third: We must plan to take back emergency

powers as soon as the emergency passes.

In an emergency the people in a democracy may have to relinquish their rights temporarily, as they have just done in England. That may be necessary in a crisis; but the citizens of democracies must insist and plan so that those rights shall be restored to the people at the end of the emergency.

Fourth: Individuals must prepare for trouble ahead.

How? If we are to have a preliminary period of good prices, and I think we will, spend not a cent of your increased income foolishly. Pay off your debts, reduce your mortgage, acquire good tools if you need them and can pay for them, buy good livestock and pay for it. It is a good time to buy a good farm if you can pay a substantial equity into it. But above all, don't get out on a limb with debt, particularly for non-essentials. Farmers are in better shape than anyone else to meet a great economic emergency, providing you make plans now so that if and when the necessity comes, you can make your farm self-sufficient, live once more as your fathers did, almost entirely from the products of your own farm.

Spiritually you can prepare for trouble, too.

Except that we may all be to blame for whatever weakness is in our own lives, no individual, especially in America, is to blame for what has descended upon the world. We did not do it, and we cannot help it. Therefore, there is no good in worrying about it. All we can do is to do our own job from day to day, and live our own lives each day as well as we can and as God gives us the light.

Will Help Dairymen

NOW IN progress throughout the United States is the largest, best organized campaign to increase the consumption of dairy products in the history of the industry. Leading it is the National Dairy Council, supported by every dairymen's organization, and other national and local farm organizations, most of the dealers,

Ah, when shall all men's good
Be each man's rule, and universal Peace
Lie like a shaft of light across the land,
And like a lane of beams athwart the sea,
Through all the circle of the golden year?
—Tennyson.

health authorities, chain stores and independent merchants, and local dairy committees are working in almost every county. *American Agriculturist* is doing its part.

All of this work is sure to bear results. It would seem to justify also the cooperation of every farmer himself, and particularly of every man who produces milk.

How can you cooperate?

First: Discourage the use of substitutes in your own family and in your community.

Second: Increase the consumption not only of milk but of other dairy products in your family.

Third: Discuss the subject of larger use of dairy products in every meeting and with every individual every chance you get.

"Fixing" Comes Home to Roost

A MIDWEST farm paper is mourning over the fact that southern farmers are growing more and more corn, thus becoming a great competitor of the Midwest corn section. Well, I am human, and that pleases me a bit, because most of those Midwestern farm papers have been enthusiastic over the AAA crop control plan. They are getting a dose of their own medicine, for when the southern farmer found his cotton acreage limited by government, he turned to growing corn, and thus became a competitor of the corn growers.

The trouble of course is that this country is too big, and the problems of crop control are too complex for it ever really to work successfully on a permanent basis. When the fixers think they have got one problem worked out, it breaks out worse than ever somewhere else. The medicine is worse than the disease.

Readers Talk Back

VITAMINS IN GRASS

"I read your article about vitamins in grass with much interest. Are vitamin concentrates available to the general public?"—A. B., Conn.

Vitamins in grass are not yet available to the public, but any one or all of the vitamins can be purchased in concentrated form at any drug store. Don't take them except on advice of a physician. A well-balanced diet is supposed to contain all you need. Personally, I don't think it does in many cases, because our soils have been depleted of some of the natural minerals and vitamins, so that necessary amounts don't get into the foods we eat. Also vitamins and minerals are lost in many foods when they are processed, and in cooking. The first thing to do about vitamins is to learn their names and the different foods that are supposed to contain each in large quantities. Milk and eggs, for example, are rich in vitamins.

"A PATTERN FOR RIGHT LIVING"

"The letters from you and Mr. William Danforth of Purina Mills struck a responsive chord with me. When any man, be he an editor or other citizen, can say anything to help another's courage in these days, he has made a contribution.

"I am a native of the town of Clarence, Erie County, New York. My father was a subscriber to *American Agriculturist* ever since I can remember. You know the conditions that surrounded me on the little old farm with the schoolhouse nearby more than 40 years ago.

"Your recent article concerning your visit to the two-roomed cabin where Daniel Webster was born I read with interest. I know the feeling that surged in you as you surveyed that sacred spot. My own ancestry played their part well. I have stood on the land in Lancaster County, Pennsylvania, that my great-great-great-grandfather bought from the heirs of William Penn at about \$1.25 per acre. I have read the old grants and the old wills of the record of descent of that property and try to visualize the physical conditions under which these people lived. They endured physical hardships but

achieved liberty; we have overcome physical hardships and are fast losing liberty.

"We have as a nation pursued the idea of security for the past several years, and never have we had less of it. Our ancestors left the places of intolerance in Europe and set themselves resolutely in a new place where the ideas they had could be established. There is no such place left on this globe.

"The other evening after sundown I walked down the lane with my wife. It was too dark to see far. The horses came and nosed us across the gate; the cows were nearby in contentment. The air was still. There was an atmosphere of peace and quiet. One felt as though one could talk directly with his Maker. The moment seemed almost to be a holy one. Such moments are afforded on a farm but seemingly nowhere else. I have had a similar feeling at night in a great redwood grove in California where it seemed as if one were in a great cathedral. Why cannot mankind as a whole take a pattern for life from these quiet experiences? But when we turn to the actual conditions we confront, the spell is immediately broken.

"All we can do is just as you say: 'Stand for the principles that made this country great and do our job from day to day as best we can.'—M. M., Ind.

WANTS NORTHEASTERN SLANTS

"Northeastern Slants was one of the first things I always read, as I am too busy to search a daily paper, consequently do not take one."—C.G.C., N. Y.

Slants will either be resumed or else the news will be commented upon on these two pages, as you will note I have done this time.

"A HEAP OF SATISFACTION"

"Articles in the A. A. are set up so definitely that even by reading the headlines one can get the meat out of each article. Your paper is doing a wonderful lot of good. There's a 'heap o' satisfaction' in doing such a job."—A. D., Maine.

You bet there is! But what I want to know is how we can do a better job.

Give all farm animals a good start in life

HEALTHY CALVES, lambs, pigs and colts—every farmer wants them. Not every farmer knows how important salt is in the mother's diet, in making sure of healthy young. Salt is just as important in the diet of growing animals, to make them thrive. You can learn best how to use salt for stock feeding from International's book, "White Gold for the Farmer's Profit."

In this book, the Research Department of International Salt Company, Incorporated, an outstanding authority in the industry, has condensed the advice of many agricultural stations and experience of practical farmers. Write for it.

International Salt Company, Incorporated, produces every type and grade of salt for use on the farm and in the farm home. It will pay you to ask for International brands by name—for good salt can earn more for you at less cost than anything else you buy for profit.

INTERNATIONAL SALT COMPANY
INCORPORATED
Scranton, Pa. New York, N. Y.

A Visit About POTATO SPRAYING

AMONG the many good potato growers in central New York are Fred Hollenbeck of Tully and Bruce Cottrell of Homer. If you want further evidence of their skill, attend the winter meeting of the Empire State Potato Club and see their exhibits. Last January at Utica the sweepstake cup for the best bag of certified seed went to Fred and the cup for the best 32-tuber sample went to Bruce. That wasn't the first time they have taken prizes, and we predict that it won't be the last.

One day recently, I dropped in about sundown to inquire how they handle

BRUCE COTTRELL.

the important job of spraying potatoes. I found Fred out in the barn milking. In addition to his potatoes he has a good dairy; but an hour later Bruce, who sticks closer to potato growing, was out in the garden pushing a wheeled hoe.

While Mr. Hollenbeck continued with his milking, I pulled a stool and began to fire questions at him.

"How many potatoes do you grow?" was the first one.

"This year I am putting in 18½ acres."

"When do you begin to spray, and how often do you spray?"

"The first spray goes on when the plants are from 4" to 6" high. During the season I put on 6 or 8 sprays. When the weather is good, I spray every 10 days. During rainy spells, which are particularly favorable for blight, I get over the field every week."

"How do you make your Bordeaux?"

"The first step is to make stock solutions of blue vitrol and hydrated lime at the rate of 1 lb. of each to a gallon of water. I hang the blue vitrol in a sack at the top of the stock solution tank as it dissolves faster in that way. Then when I am ready to spray, I start running the water into my 50-gallon spray tank. When it is about half full, I put in 5 gallons of stock solution of blue vitrol. Then as the tank fills, I dilute 2½ gallons of the stock lime solution and add that as the tank is being filled. This gives me a Bordeaux with a formula of 5-2½-50, meaning that in the 50 gallons of spray there are 5 lbs. of copper sulphate and 2½ lbs. of lime."

"What do you use for the Colorado potato beetle?"

"I use calcium arsenate. Usually about one dose of this poison is enough. I put a package which contains about 4 lbs. in a spray tank. Probably less would do the trick, but it isn't expensive, and I want to be sure to have enough."

"What makes the difference between a good job of spraying and a poor one?" was my next inquiry.

"You have to have pressure enough on the sprayer to cover the vines. I use a traction sprayer, but I am able to get 400 lbs. pressure. Then you have to watch the nozzles to be sure they don't clog. I always have more trouble the first day. Regardless of how careful you are in cleaning out the tank in the fall, there is likely to be some scale that causes trouble. Of course, I strain all of the material that goes into the tank through a brass screen.

"Also, I like to alternate the direction of spraying. If I start out going east on a field, I like to reverse the direction and go west on those rows the next time I spray. Bordeaux is a protection against late blight and not a cure, so as the plants grow, they have to be thoroughly coated with Bordeaux on both sides and kept that way throughout the season. My outfit has three nozzles for each row. One shoots the spray directly down on top of the plants. The others are located one on each side of the row and are aimed upward so they direct a cross fire on the under sides of the leaves."

While I was there, I branched off from the question of spraying and asked a few questions about other potato problems. Fred believes that to grow good potatoes, you have to start with disease free seed, provide ample plant food, keep the weeds down, and conserve the available moisture as much as possible. He puts manure on his potato land, and this year is adding half a ton of 4-8-7 fertilizer. When fitting land, he cultivates deep and plants the potatoes deep.

Shortly after bidding Mr. Hollenbeck goodbye, I was asking Bruce Cottrell

FRED HOLLENBECK.

the same questions. Bruce has a slightly different method of making Bordeaux.

"I have a sprayer which is run by a power take-off from a tractor. Although it costs about 1¢ a pound more, I buy my blue vitrol in the form of a fine powder which, when the agitator is running, dissolves almost instantly. I start running water in the tank and dump in 5 lbs. of blue vitrol. Then, after the tank is half full, I put in 2½ gallons of a stock solution of hydrated lime."

"How much Bordeaux do you put on to the acre?"

"It takes about 100 gallons, and I like to put it on at 400 lbs. pressure."

"Didn't growers formerly use as much lime as copper sulphate in Bordeaux?" I asked.

"Yes, they did, but experiments have shown that half as much lime as copper sulphate is all that is essential to

(Continued on Page 11)

SOIL STARTS ON SEA VOYAGE

Usually when we think of soil erosion, we visualize the formation of gullies. Less spectacular, but equally serious, is the removal by rain of top soil in what is known as sheet erosion.

This picture was taken on the farm of Frank Moravia, near North Lansing, Tompkins County, N. Y. The field has a 7 per cent slope, which means that it drops 7 feet in every 100. It was harrowed on May 16, and that night there was a heavy rainfall. The flat stone which has been lifted protected the soil under it, while the soil around it was being carried away. The removal of the flat stone shows in a rough but convincing way the amount of fertile top soil that has been lost.

Sheet erosion can be prevented by keeping steep slopes in grass as long as possible, and when a cultivated crop is planted, by laying out the field so that the rows run on the contour.

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

A STRIKING ILLUSTRATION of how the Grange mobilizes farmer strength for the protection of agriculture has just come to light in Madison county, Ohio, and is an effective answer to the question sometimes asked, "What does the Grange accomplish?" A local newspaper sponsored a three days' "cooking school" in the theater of a town in the county, financed by the manufacturers of a vegetable shortening — a lard substitute. A lot of advertising was given to the approaching event, when the Grange immediately took the lead in a monster protest of farmers against what was certain to work injury to the pork industry, an important part of the farm activities of that county. So much opposition was aroused that the "cooking school" was canceled, and similar projects contemplated in other Ohio counties, if the first one had been a success, were eliminated.

One of the Grange fights from its very beginning has been against substitute products whose adoption would work injury to various lines of agricultural production. "Pure foods, pure fabrics and pure politics" has long been the triple goal of the Grange organization, and again and again illustrations are furnished of how such objectives are reached, similar to the present case in Madison county, Ohio.

DELHI GRANGE in Delaware County, New York, recently did a very kindly thing by preparing a jolly variety show with an exceedingly attractive program, and then presenting it at the Delaware County Sanatorium for the benefit of the inmates. Shortly after, the same program was taken to the Delaware County Home with equally enjoyable results. Again and again Granges have taken programs to such institutions as children's hospitals, old people's homes, etc., and have contributed a period of genuine relaxation and happiness to those obliged to spend their days there.

THE ENTRANCE of National Lecturer James C. Farmer into the gubernatorial campaign this fall in New Hampshire has aroused widespread interest throughout the Granite State, and the assurances of support come to Mr. Farmer from leaders in all parties are highly gratifying. He will strive for the Republican nomination at the September primaries and his chances are considered excellent. New Hampshire has frequently had Grange Governors in past years, notably Nahum J. Bachelder, who was Master of the National Grange for six years, following a similar term as National Lecturer.

CONNECTICUT PATRONS are greatly concerned over the illness of State Overseer Francis L. Roberts of Wethersfield, who is now confined in the U. S. Veterans' Hospital at Newington, following a considerable period of ill health. Mr. Roberts is one of the bright young Grange leaders in Connecticut and a hard worker for the Order.

SUNDAY, JULY 28, will be Grange Day in Maine, with a big state-wide event planned at the Empire Grove Camp Meeting grounds at East Poland. It will be an all-day event, with a record-breaking attendance confidently expected and with State Master F.

Ardine Richardson presiding—fittingly so, because of his position as Chaplain of the National Grange.

TWO GREAT rally nights recently held in New Hampshire have created widespread interest. One was at Keene, with an attendance of 840 Patrons, and another at Plymouth, with 450, the latter one of the rainiest nights of the entire season. Many came to both these rallies who lived more than 100 miles distant and fully 100 subordinate Granges were represented in the two audiences.

TWO NEW GRANGES just instituted within the New England area are at Marlboro, Connecticut, and at Whately, Mass. In both cases there was a good-sized charter list, nearly 100 signers

at Whately. Other fields in these two states are under cultivation, and meanwhile, new Juvenile units are being added to the roll in about every New England state.

ONE OF THE BEST meetings held in a long time by Rocky Hill Grange in Rhode Island was a program built around the topic, "A Milestone in Farming," to which each member responded by telling the history of a given farm product or some piece of machinery that has been influential in making agricultural progress. Responses were varied and instructive, and in many instances pictures relating to the product or to the farm machinery described were displayed for inspection. The whole program gave a new vision of the rapid progress agri-

culture has been making within the past half century.

DURING THE PAST few weeks six New York State subordinate Granges have celebrated the completion of more than 50 consecutive years of service; in the case of Stockton Grange, No. 316, in Chautauqua County, its 65th anniversary. By contrast the interesting fact appears that during exactly the same period, seven new Juvenile branches have been added to the Order in the Empire State, with a small army of youngsters enrolled, all eager to be "good Grangers."

ONE OF THE most prominent members of the Grange in Connecticut has been removed by the death at his

Ford gives you more of the *THINGS THAT REALLY COUNT* in a farm car!

GET THE 1940 FACTS AND YOU'LL BUY A FORD!

GREATER ECONOMY! Ford V-8 gave *best gas mileage* of all standard-equipped cars in its price class in this year's official Gilmore-Yosemite Economy Run. Owners report *no oil added* between 2,000-mile changes.

EXTRA COMFORT AND SAFETY! Among low-price cars Ford V-8 has the longest springbase, the most rear-seat knee-room. Total inside body length is greater than many higher-priced cars. And for extra safety . . . Ford has the biggest hydraulic brakes.

SMOOTHER PERFORMANCE! It takes an "8" to match an "8" in smoothness and all-round performance. And the Ford V-8 engine is the only 8-cylinder engine at low price!

MORE FINE-CAR FEATURES! Only Ford at low price has a fine car type semi-centrifugal clutch, *full* Torque-Tube Drive, precision valves that need no regular adjusting. Ford alone has "mirror-finish" cylinders plus fine-car engineering that eliminates tedious "breaking-in" period.

Look at the things that really count.
Get the 1940 facts and you'll buy a Ford!

FORD V-8 A GREAT FARM CAR!

BREEDING CATTLE

Artificially

By E. J. PERRY.

New Jersey College of Agriculture.

THERE is much discussion today about artificial insemination of livestock, particularly dairy cattle with which most of the work has been done to date. I have just received a letter from a dairy leader of the Middle West containing this statement, "Interest in the organizing of artificial breeding associations is beginning to develop in some sections of our state, but I fear some of this interest is based on curiosity and in a few cases commercialization." We replied that we thought it would be very unwise to attempt an organization under such circumstances and offered some suggestions based on two years of experience with artificial breeding in New Jersey.

Artificial breeding associations are of two kinds—those employing a full-time technician (preferably a veterinarian) and those that operate on a part time basis. A well organized, full time association has at least 1,000 cows enrolled on the membership contracts. There is no minimum number for a part time group, as its work is usually performed by a local veterinarian in connection with his regular practice. When this official is employed by a full time unit, it is necessary that he have an assistant because the breeding must be done as promptly as possible after the phone calls are received.

Four Essential Requirements

There appear to be four important essentials necessary to the successful operation of a cooperative artificial breeding association. They are:

1. An intense interest in herd improvement by the members and enough cows enrolled to insure sufficient finances.
2. Exceptional sires available for use. At least half of these should be highly worthy proved sires.
3. A competent technician, preferably a veterinarian with a knowledge and sympathetic understanding of dairy-men's problems. He must also act in the capacity of manager, explaining the work, keeping careful records of breeding, of bull efficiency, and of finances.
4. Reasonable patience. Some members are inclined to become panicky if it happens that the first two or three cows bred do not conceive on the first or second insemination. Perhaps their herds are beginning to experience some breeding trouble, slight or possibly serious.

It has been observed that in more than 90 per cent of such cases as the above, the conception rate will improve

if the owner does not grow discouraged, and continues artificial breeding. The members who still retain a bull say, "It works both ways. Some cows that fail to conceive artificially will do so when mated naturally and sometimes a cow that has repeatedly missed naturally will catch artificially." As with most new undertakings bad news seems to travel faster than good news. It is those cows that required three or more inseminations or that conceived when turned with a bull after failure to catch by artificial means, that are frequently heard about.

As between the two methods there seems to be little or no difference in conception rate when cows in heat are reported promptly to the veterinarian. This was proved in Denmark three years ago as it has since been proved in this country. When the average number of services or inseminations per pregnant cow is less than 2 it is considered good, by veterinarians experienced in sterility work. To the writer's knowledge the pregnancy rate for the various associations now operating in the country has not gone above 2. Nearly all of them run between 1.5 and 1.9. From 50 to 65 per cent conceive on the first insemination. A few hard breeders in a herd will quickly cause a bad conception picture. The larger the herd the more breeding trouble there is likely to be. In "Dairy Science" Petersen reports the natural breeding efficiency of the herd at the University of Minnesota for a 29 year period. In a total of 1,280 first services, 547 cows or 42.7 per cent conceived. A survey of the natural breeding record of a number of New Jersey herds for recent years, indicate a conception of 50 to 70 per cent on first service.

A lessening of the chance of spreading certain genital diseases from cow to cow by the bull is an advantage that is becoming more appreciated by breeders. This is one of the reasons why more of the well known breeding establishments are beginning to practice artificial insemination.

Keep a Bull or Not?

It is doubtful if the owner of a herd of less than 20 cows can purchase and keep an exceptionally well bred bull at less cost per year than he can have his cows bred in an artificial breeding association. In fact a number of herds with 20 to 40 cows keep no bull today. On the other hand, some dairymen with these larger herds breed their best cows in the association and have on hand a cheap yearling bull as a "cow freshener" for their less productive cows from which no offspring will be raised. This is good policy.

Dilutor a Boon

The new dilutor just discovered by the Wisconsin Experiment Station and already in use by most of the associations, is proving a great boon. It is composed of equal parts of fresh egg yolk and a specially prepared phosphate buffer. Upon dilution with it at the rate of 1:3 to 1:5, a normal ejaculate of semen is not only expanded in volume, enabling the breeding of 20 or more cows, but it is preserved so that it can be used until it is three days old or even longer when stored at a temperature of 42 to 45 degrees Fahrenheit. This means that if an association wants to include a breed of cows lesser in numbers in a district, that this can be done at little extra cost. One bull

will suffice for 300 or more cows by using him every third day, provided most of the cows do not have to be bred in the same season of the year.

Additional Recommendations

1. Variation in insemination rate per pregnancy is not confined to mature bulls. Some young bulls are not only low in rate per pregnancy, but vary greatly in amount of semen per ejaculate.
2. Bulls used infrequently often give semen devoid of sperm in the first and sometimes in the second ejaculate.
3. Insemination during full and late estrum shows the highest rate of conception. Full estrum (heat) is one that has progressed 8 to 12 hours and late estrum is 12 to 24 hours.
4. The daily use of the microscope is a very important safe-guarding factor of the program.
5. It is best to withhold nearly all feed and water from the bulls in the morning until after they have been used.
6. Regular systematic exercising of bulls is highly beneficial.
7. The bulls should be centrally located. Care and management supervision should be under the direction of a managing committee or directors whose word will be law. The bulls must have the best care possible to give a breeding animal.
8. All breeding service should be on a cash basis. Credit breeds dissatisfaction.
9. Large units are more easily managed than several small ones.
10. Cooperative artificial breeding of livestock affords the greatest opportunity for animal improvement today. With sound leadership and a well planned program with good sires it will succeed. Much need still exists for both scientific and practical knowledge in animal breeding.

The No. 1 Association of New Jersey affords examples of how the use of good proved bulls can be greatly extended. Recent figures on some of the sires are as follows:

Bulls	Breed	Months Used	Cows Pregnant
Career —	H	23	977
Alice —	H	18	525
Champion —	H	15	580
Butterfat —	G	16½	354
Bayboy —	G	10	170
General —	H	3	100

"Dos" and "Donts" for Calf-hood Vaccination

CALFHOOD vaccination as a method of protecting herds against the ravages of Bang Abortion is getting much attention these days. The chief questions as yet unanswered are: "How long will calfhood vaccination give immunity?" and "How many vaccinated heifers will continue to react to the blood test?"

The point to keep in mind is that calfhood vaccination is one more weapon to use against this scourge, and that it should be used along with other methods rather than as a "cure-all." There are, for example, many herds that are clean as a result of a Federal-State test and slaughter program. Certainly it would be the height of folly for anyone with a clean herd to abandon the ground he has gained and to rush into a vaccination program.

It is equally unwise for a man who has had no trouble from abortion in the herd to start vaccinating calves without first having a private blood test made on all animals.

An indiscriminate program of vaccinating, particularly if many dairymen without all the facts should vaccinate producing animals as well as calves, might well result in a condition where Bang Abortion would become so widespread that it could never be eradicated. The better plan is to use calfhood vaccination as one more weapon to add in the fight toward eventual eradication.

Fortunately tests to date indicate that a big majority of animals vaccinated as calves will give a negative reaction to blood tests when they come of producing age. That fact gives hope to the man whose herd is badly infected that through a vaccination program, coupled with blood testing, he may eventually build up a clean herd.

THE LEAGUE STANDS FOR THE AMERICAN WAY

What is this Liberty we seek?

Said Abraham Lincoln:

"The shepherd drives the wolf from the sheep's throat, for which the sheep thanks the shepherd as his liberator; while the wolf denounces him for the same act as a destroyer of liberty. Plainly the sheep and the wolf are not agreed upon a definition of the word liberty; and precisely the same difference prevails today among us human creatures."

EVERY American believes in the "certain inalienable rights" promised him by the Declaration of Independence — particularly the right to "life, liberty and the pursuit of happiness." But not all Americans understand the same thing when you say liberty.

To some it means the right to follow their own selfish impulses, regardless of the effect upon the liberty of others. Thus, some profiteering milk dealers feel they have the right to force milk prices so low that farmers are faced by virtual starvation and slavery.

To others, such as radical agitators, it means the right to force farmers to obey their wishes — either by mob clamor, by dumping milk, or by menacing property.

If the government, or cooperative groups, dare to intervene to save farmers from the clutches of wolves such as these, they make a great outcry. Their liberty, they say, is being interfered with.

But the liberty to which the Dairymen's League subscribes . . . the liberty which everyone freely admits is that intended by the Founding Fathers — is a vastly different matter. It is the liberty of responsible action which everyone enjoys when men respect each other's rights and property. It is the liberty of ballots, not of bullets. The liberty which recognizes that two opposing views can never rule at the same time . . . that the majority must prevail.

Liberty of this kind is won only through cooperation . . . through peaceful intention . . . and mutual respect. It is the liberty of organization . . . steadied by the wisdom and cool counsel of many minds, not tossed hither and yon by the whims of rash judgment and of sudden impulse. It is the liberty of democracy as opposed to the tyranny of dictatorship. It is the liberty that is kind to the weak, just to the strong, merciful to the transgressor. It is the liberty of the American Way . . . willing to sacrifice pride of personal opinion to the common good of all.

In a word, it is the only liberty which befits reasonable men . . . the liberty which oppressed farmers everywhere were seeking when they formed the cooperative organization known as the Dairymen's League.

Wouldn't Trade His American Farm for the Whole Danish Peninsula, Says Chris Brown

Before Chris Brown came to America, he lived in Denmark. The shadow of the German army fell across the little country, chilling the hearts of all.

"We couldn't tell at what minute they might strike," said Chris. "We didn't know when they would take our land and our homes. At any moment there might be an invasion and we would have nothing left. We would be a subject race. I wanted security for my wife and children," he continued. "And so I came to America. I want to stay in America as long as I live. I wouldn't trade my present farm for the whole Danish peninsula."

But Chris did leave America once. And he left to fight the German army. He fought in France with the American Expeditionary Force during World War No. 1.

Today he and his family live on a farm east of Oakfield. They send their milk to the Buffalo market. The photograph shows him standing in the doorway of his brick milkhouse — one of the finest in the section.

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

The First Class in POULTRY HUSBANDRY

WHEN a complete history of New York State agriculture is written the picture on this page will deserve a prominent place. It shows the faculty and students of the first winter short course in the New York State College of Agriculture in 1892. In the group are several who heard the lectures on poultry keeping by Professor James Rice.

When Professor Rice brought the picture to us the other day, he said:

"I have been reviewing the notes that some of the students took from these lectures, and when I read some of the recommendations that we handed out in those days, I can only hope that they did not do too much harm."

We suspect that Professor Rice was overstating the case, but it is no overstatement to say that knowledge about keeping hens has doubled and tripled several times over since 1892 and that Professor Rice has ever been in the front ranks of those who sought to fathom the mysteries of the hen and to pass on that information to poultry keepers.

On June 29 the poultry building at the New York State College of Agriculture will be formally dedicated as "Rice Hall," a fitting tribute to a man who pioneered in making the hen a respectable member of farm society instead of a sadly neglected barnyard sideline. As most of you know, Professor Rice is now living at Mexico, New York.

Who are the men in the picture? Some are known, but the passing of the years has brought changes in the style of men's clothing and greatly lessened the popularity of beards and mustaches.

For the purpose of identification, we have numbered each man. Those whose names are known are as follows:

2—Floyd Q. White, formerly of Yorktown, N. Y., now residing in Miami, Florida.

6—Mathews, was assistant in dairy department.

7—James E. Rice, now of Mexico, N. Y.

8—George C. Watson, was assistant in agriculture.

9—H. H. Wing (deceased) was assistant professor in experiment station.

10—Liberty Hyde Bailey, at that time professor of horticulture, now residing in Ithaca, N. Y.

11—Isaac P. Roberts, (deceased) was head of Department of Agriculture.

15—Lee C. Corbett, was a graduate student.

21—Fay Giddings of Baldwinsville.

38—Henry McLallen, Trumansburg, N. Y., and still residing there.

47—Harry Bull, Campbell Hall, N. Y., still residing there.

We trust this will be read by many

who attended that short course. If so, write to *American Agriculturist* by return mail, giving us the number of your picture as it appeared in the portrait, and your full name and address; as well as the numbers, names and addresses of as many of your fellow students as you can recall.

If you are interested, keep this copy of *American Agriculturist* for future reference, as we plan to publish additional names and interesting facts concerning individuals pictured here, in future issues.

Yellow Rocket is On the March

(Continued from Page 1)

4. Rocket is spread by buying hay from other farms which are infested.

How to Control Rocket

Prevention is, of course, more important than trying to handle rocket after a bad infestation. No farmer who

has had experience with this bad weed needs to be told that control is a hard job. There is no one cure-all, no one method that will entirely prevent the spread of this weed. Complete eradication after a bad infestation probably is too much to expect, but control it you must if you are going to continue to produce crops. Here are some of the prevention and control methods:

1. Buy clean, high-quality seed. Avoid poorly cleaned, locally grown alsike and timothy seed.

2. Badly infested fields may be disked or harrowed several times in late summer or early fall to destroy rosettes (see drawing) and to induce the seeds to germinate. Plow under next spring and follow with a cultivated crop. Clean cultivation in a short rotation is in fact probably the best means of control not only for rocket but for most other weeds.

3. Where the infestation of rocket is just started, pull or chop out every

plant, take them off the field and burn them. That's a lot of work, but it may save you hundreds of dollars in years to come. Rocket seed matures even after immature plants are cut, hence the need of removal.

4. Don't sweep out the haymow and throw the chaff on the meadow.

5. The farmer who has no rocket should avoid buying any hay, if at all possible.

6. Keep ditches clean, and try to get your neighbors to do the same.

7. Cut hay as early as possible, and if there are spots where there is a bad infestation, such as swales or water runs, cut that hay separately and burn it.

8. Make grass silage, particularly of the hay which has yellow rocket in it. The heat, and especially the acid, of the silage kill the rocket seed, and by cutting the hay early for ensilage you get the rocket off before it seeds back on the land. Where grass silage can be made, it is one of the best rocket control methods.

9. In new meadows it has been suggested that you mow the tops of yellow rocket as soon as the flowers appear, and low enough to catch the lowest flower stalks. This method may not be practical in every case, and there is

5. Yellow rocket plant with rosette of leaves produced during first season.

danger of injury to your grass stand.

10. Spraying will control mustard, but is not safe to use on rocket, because a spray mixture strong enough to kill the rocket may also kill the crop.

Cooperative Campaign

Here is a problem that cannot be entirely solved in any community by individual farmers working alone. If one man cleans up and his neighbors fail to do so, he will be right back with them in a year or so. I suggest therefore, the following cooperative campaign:

1. Talk this problem over with your county agent. Get him to call a meeting in your neighborhood to discuss the problem of rocket and agree upon a united program of control.

2. It is suggested to all Grange lecturers and to those in charge of other local farm meetings where there is rocket in the neighborhood, either a bad infestation or where it is just starting, that an entire meeting be devoted to working out a program for the control of this weed.

3. I suggest also that teachers of agriculture in all sections where there is rocket emphasize this problem with their students, and the need of a united cooperative program to control it.

4. It is further suggested that seedsmen cooperate to make sure that their grass seed is free from rocket seed.

In order that *American Agriculturist* may continue to help you fight the losses caused by this invader, I am asking any and all farmers who have had any experience, as to losses or any special means of control which they have used, to write me a letter, that I may pass on the information to others whom it may help. Sit down and write me now.

We are doing our part. Will you do yours?

Here is one of the most remarkable and interesting pictures ever printed in *AMERICAN AGRICULTURIST*. It shows students and faculty of the first winter short course of the New York State College of Agriculture. Among them are a number of poultry students in the first poultry course in the United States, and probably in the world. The time, 1892. Organizer, teacher and leading spirit, James E. Rice. See editorial on page 4.

"PACKAGES to Burn"

By PAUL WORK.

NEARING completion and publication is "Freight Container Bureau Tariff No. 4, Northeast Territory" which contains drawings and detailed specifications on approximately all fruit and vegetable containers which are in use for rail shipment from Maryland to Wisconsin, and from Illinois to Maine. Naturally, it includes also most of the packages which enter into motor truck movement.

Paul Work

The Freight Container Bureau of the Association of American Railroads, of which Edward Dahill, 30 Vesey Street, New York City, is Chief Engineer, has been holding hearings throughout the territory affording opportunity for railroad men, shippers, package manufacturers and growers to offer objections or suggestions regarding these specifications.

I attended the hearing at Rochester. It was very peaceful. Farmers were not there; as far as I know, no shipper dealers nor receiving produce merchants; just a few package makers, and perhaps 20 or 25 men connected one way or another with the railroads.

Since proof copies of the Tariff were fairly widely circulated and considerable publicity was given to the movement, the quiet hearing may be interpreted as a tribute to the care with which the book has been prepared. If this is not so, it was up to those interested to make themselves heard.

One of the splendid features of this movement, which has given us now four books covering Pacific West, Central West, Southeast, Northeast, lies in the fact that each container is given a number uniform throughout the series. Thus, the Northwest apple box carries numbers 10 and 11. Numbers for the New York 3/8s crate run from 465 to 468; for the Los Angeles lettuce crate, 926, and so through the list. This assignment of identification numbers to various containers ought to be of immense value in discussing containers, in quoting prices, and placing orders, and, in general, furnishing us a common language to use when we are talking about packages.

The whole movement is aimed toward standardization of packages. Many container numbers are preceded by the letter "T" meaning temporary with the idea that some of these which differ only a little from others, may be gradually eliminated.

A Visit About Potato Spraying

(Continued from Page 6)

prevent burning. Apparently the more lime you add, the more the spray shades the plants; and tests have shown better yields where Bordeaux carries the smaller amount of lime. A smaller amount of lime also results in less clogging of the nozzles."

Bruce puts on approximately as many sprays as Fred, but he made this interesting comment: "I once heard Professor Nixon of the Pennsylvania State College say that, under ideal growing conditions, a potato plant can grow a leaf in three days. For complete protection, I suppose a grower should spray every three days."

"What do you use for Colorado po-

tato beetles?"

"Calcium arsenate. I put in .2 lbs. to each 50 gallon tank."

"How do you protect the crop from other insects, such as flea beetles, aphids, and leaf hoppers?"

"While it doesn't control them, Bordeaux mixture does discourage these insects."

Bruce is inclined to make a little heavier applications of commercial fertilizer than Fred. The two men are equally emphatic as to the necessity for disease free seed. Bruce likes to plow his potato land in the fall as he feels that it holds moisture a little better, and he is thoroughly sold on the idea that the only reason to cultivate any crop is to kill weeds.

"A lot of damage has been done," he says, "by cultivating deep and cutting off a lot of roots. Besides that, I believe that stirring the soil up to a considerable depth increases the rate of evaporation instead of lessening it."

At both farms I asked this question: "How can the small grower with an acre or less and the home gardener with a few rows do an effective job of spraying?"

Both Bruce and Fred agree that it is difficult to control blight with a hand sprayer, although they felt that by using extra care, it might be done. They agree on another point. A small hand duster will closely approach the job done by a power duster; while a hand sprayer, because of lack of pressure, is much less efficient than a power sprayer. Dusts are on the market to control late blight and to kill both biting and sucking insects.

There are arguments in favor of dust. There is less weight to draw; it can be put on faster; and in periods of heavy rainfall which are just the times when blight spreads rapidly, the field may be so wet that it is difficult to use a 50-gallon sprayer. On the

In 1936 M. B. Adams of Oneida, N. Y., seeded a field of 10 acres to the Cornell Pasture Mixture. Before seeding, the land was manured and 500 pounds of 20 per cent superphosphate were added. Since then the pasture has had no treatment.

This year on May 2, 18 Angus beef animals were turned on the 10 acres and left there until May 24. This picture shows one of the seven loads of hay cut from the 10 acres and being put in the barn on June 6. This barn is used for one of the herd sires, for horses, and for young stock.

other hand, the cost of dust to cover an acre is usually greater than the cost of spray; and to be most effective, it is necessary to dust early in the morning or late at night when there is dew on the leaves, or just following a rain. The ideal situation, as some put it, is to have both a sprayer and a duster.

To sum up the situation in a few words, make or buy a good product, spray or dust often enough to keep the new growth covered, and watch to see that the material is actually hitting every plant.—H. L. Cosline.

The Weather and the Bible

By RAY WORMLEY,

Van Etten, N. Y.

EVERYONE talks about the weather—even busy housewives in villages. Old timers have their favorite signs such as corn husks, caterpillars, rainbows, etc. I have been watching the weather since the first time I got my feet wet, so perhaps I can be forgiven if I quote from the Bible. Listen to the words of Jesus (Matt. 16:2-3): "When it is evening ye say, it will be fair for the sky is red. And in the morning it will be foul weather, for the sky is red and lowering." Try that sign some day if you care to.

Last summer I planted six acres of garden stuff. I would choose the worst summer in 46 years. What the hot sun did not burn up, the grasshoppers ate. But listen to this: (Deut. 28:38-39): "Thou shalt carry much seed out into the field and shalt gather but little in;

for the locust shall consume it. Thou shalt plant vineyards and dress them and shalt neither drink of the wine or gather the grapes; for the worms shall eat them." Yes, it has happened before—many times.

I was talking to a friend the other day about farming, the weather, etc. And we both agreed that we need more science if we expect to make a living. What has the Bible to do with science? Read the next two references.

(James 5:17): "Elias was a man subject to like passions as we are, and he prayed earnestly that it might not rain, and it rained not on the earth for the space of three years, six months." This may not be the longest dry spell on record, but it is long enough.

In Genesis 41 we have the story of the seven lean years and the seven fat years. I don't know much about history, but I guess that Pharaoh was the first dictator to build government storehouses and fill them with grain. Or would you call Joseph the dictator? Well, at any rate Egypt had a corner on grain. People crossed the desert to buy their grain in Egypt, and the government got rich out of the famine.

I was interested to read an article in the Country Gentleman, by Ben Hibbs on "The Weather in Cycles."

"What ho!" I said. "This is right down my alley, so to speak." And I gobbled it up. It seems that some weather men have a theory something like this:

Sunspots flare up and die down at regular intervals. The sun gives off more radiation at some times than at others. This radiation makes patterns, curves, or cycles. What is more important, these curves check with the

weather, with rings inside the logs of trees, and with many other things—maybe even Bible stories. In other words, if you have a graph of the sun's radiation for any locality for 100 years or so, you can roughly forecast the weather for a year or two ahead.

Now I am not a government official and have no reputation to lose, so here goes. I have before me a chart of the weather at Peoria, Illinois, for the last 77 years. Since the weather repeats itself every 23 years, all I have to do is figure out what it is going to do in 1940-41. Laugh if you want to. I remember a hot, dry summer when I was a boy. We drove our cows a half mile to water, and drew water for the house in milk cans. That happened the summer of 1910, and the graph shows a hot, dry summer.

I have checked on one or two other memories, and have been forecasting the weather this winter by this graph. Sometimes, of course, the dry spells come in the winter, and that does not affect the crops of the northern farmer so much, and the cycle may be a month or two late. It doesn't always repeat itself on the exact day.

Well, here is the weather for 1940-41. I predict a normal rainfall during April and May, with a dry spell the latter part of June; hot, dry weather during July, August, and September, with occasional showers (not so dry as last summer). You can look for a wet spell in October or November; with a dry winter in the north and not much snow, at least considerably less than last winter.

All right, my reputation is made or ruined. If I am wrong, write and tell me. Let's get all the fun we can out of the weather.

(EDITOR'S NOTE: Mr. Wormley's prediction for April and May was a bit understated! Rainfall has been more than normal.)

Ten Dollars for One

The Pennsylvania State College of Agriculture estimates that on a ten-year basis it costs about \$4.00 per year per acre to apply lime and superphosphate to pasture. This is for materials alone, and does not include the time required for application or for clipping weeds, scattering droppings, or other items of management.

Furthermore, it appears that for each dollar invested, a dairyman stands an excellent chance of getting as much as \$10.00 worth of feed. There are not many investments that will give that much return.

The FARM NEWS

Empire State Potato Field Day

Sponsored jointly by the Empire State Potato Club and the Farm Bureaus of western New York is the Annual Potato Field Day to be held August 8 at the farm of Master Farmer Gilbert Prole of Batavia.

Harold Simonson of Glen Head, President of the Potato Club, has named the following committee chairmen to make the necessary plans: Ralph Morgan, Genesee County Farm Bureau, General Chairman; E. V. Hardenburg, Ithaca, Program; H. J. Evans, Georgetown, Trade Show; C. N. Turner, Ithaca, Machinery Demonstration; J. R. Livermore, Ithaca, Educational Exhibits; M. J. Merton, Batavia, Junior Contests; Gilbert Prole, Batavia, Grounds; George Torrey, Stafford, Refreshments; and R. F. Fricke, Ithaca, Publicity.

This year's Field Day will be the 11th annual event held each year on a different farm in a different section of the state. It is expected that this year's Field Day will see more farm machinery than has ever been gathered together on one farm. This is partially due to the fact that much farm machinery is manufactured within a few miles of Batavia.

Those who wish to see some of the muck land potato growing around Elba should plan to reach Batavia on August 7. Plans are being made for an organized tour through that area.

Printed programs will be available soon at County Agents' offices.

More State Investigations

The 1940 New York State Legislature authorized six new investigating committees. Appropriations to handle expenses of the committees total \$100,000. Subjects to be looked into are: the state educational system, pari-mutuel horserace betting, assessment review, highway survey, interest rates on small loans, and trichnosis in hogs.

A number of old committees were continued with additional appropriations. These include: a committee to investigate industrial and labor relations, a committee on inter-state co-operation, World's Fair Commission, and Flood Control Commission.

New York Jersey Sale

Five hundred people attended the Jersey Field Day and Consignment Sale at the Geneva Experiment Station at Geneva, N. Y., on June 1. Forty-five bred heifers and cows, sold at auction, brought an average price of \$160 each. These cows had been carefully selected by a Sales Committee. The top price was \$360 for Cowslip's Successor Queen, consigned by Meridale

Farms of Meredith, N. Y., and purchased by A. W. Allen of Howells, N. Y.

Also sold at auction were 6 young bulls, which brought an average price of \$128.33. High price for this group was \$160 for Brookhill's Baron Design, consigned by George Sisson, Jr., of Potsdam and sold to George Strugan of Manlius, N. Y.

Several breeders through the state

A.A.-Grange Cookie Contest News

Prizes Announced for State and Pomona Winners

IF YOU don't believe that Grange brothers are taking a big interest in the cookie contest being sponsored by New York State Grange and *American Agriculturist*, just read the list of winners published with this article. Names of three men are among them, and these victors over the fair sex will be among the contestants in the county cookie contests to be held later.

Another proof of masculine interest in the contest comes from Mrs. George Mead, chairman of Somerset Grange Service and Hospitality committee, Niagara County, who writes:

"Our contest was much enjoyed and a great deal of interest shown in sampling the prize cookies. One brother, who was a charter member of our Grange, said: 'I haven't tasted a cookie like that in 50 years, the kind that melts in your mouth like my mother used to bake.' Another brother said: 'There were eight boys in our family and my mother made a large crockful of rolled sugar cookies like these once every week.' Having the contest brought back pleasant memories to many, and has helped to revive interest in having a well filled cookie crock of old-fashioned sugar cookies."

The number of Grangers who have taken part in the contest so far has passed the thousand mark, and is expected to climb to 3000 by the time all of the Subordinate Granges have held their local contests. Prizes which will be awarded to Pomona and State winners by *American Agriculturist* advertisers have just been announced. Here is the complete list, including cash prizes to be given by this publication to State winners:

Pomona and State Contest Prizes

American Agriculturist:

To State winners: First prize, \$25; second, \$10; third, \$5; fourth, \$3; fifth, \$2; and \$1 each to fifteen next highest winners.

Cooperative G.L.F. Products, Inc., Ithaca, N. Y.:

To each of 10 highest State winners: 20 lbs. G.L.F. Quality Patent Flour, 5 lbs.

donated heifer calves to the state club. There were 13 of these calves, and they sold for a total of \$785.

The highest total for a single consignor went to George W. Sisson, who consigned three cows and a bull calf. The 4 sold for a total of \$995. Mr. Sisson is former President and Director of the Jersey Cattle Club, and is probably the oldest Jersey breeder in the State of New York.

The morning program began with an address of welcome by Director Parrott, followed by a talk on artificial breeding by Dr. G. W. Salisbury of Cornell.

MISS ANNA FUSEK.

One of the speakers at the Home Department Session of the Annual Meeting of the Dairymen's League at Utica on June 19 is Miss Anna Fusek of Waterville, N. Y. Miss Fusek is a Senior in the College of Home Economics at Cornell. She is speaking on home economics as a vocation, a talk which won first prize in a speaking contest during Farm and Home Week at Cornell last February.

Mrs. Carroll R. Tiffany, of Conklin, N. Y. (Broome County), who won first prize in the cookie contest held by Progressive Grange. Mrs. Tiffany is a charter member of her Grange.

Sterling Salt and 55 3-oz. packages of Seasoning.

Kalamazoo Stove & Furnace Company, Kalamazoo, Michigan: A Governor Coal and Wood Range to State winner.

Northwestern Yeast Company, Chicago, Illinois:

To each of 10 highest State winners: Two months' supply of Maca Yeast to be mailed two packages weekly, and an Aluminum Home Baking Set.

To Pomona winners: Two months' supply of Maca Yeast to be mailed two packages weekly.

Perfection Stove Company, Inc., Cleveland, Ohio:

To each of the 4 highest State winners: A No. 142GEI Perfection Oven.

To Pomona winners: 110 No. 33IX Cook Stove Wicks.

Contest reports have been pouring in to this office during the past few weeks. Here is another long list of winners:

The Trend Toward Price Regulation

By LELAND SPENCER

EVERYONE is more or less aware of the increasing importance of price regulation of different kinds in our economic life. Probably the extent to which we have shifted away from competitive prices is not fully realized because so much of the regulation is indirect. The following partial list of commodities and services with which farmers are concerned and which are affected by some degree of public or private control will emphasize this point:

Leland Spencer

Corn, wheat, cotton, etc.—At times basic prices have been fixed by the federal government through the granting of loans to farmers at or above the market value of the crops. Indirect price regulation has also been attempted by restriction of acreage.

Fruits and vegetables.—Prices for certain crops have been regulated indirectly by marketing agreements which restrict the grade or quantity shipped. California oranges, peaches, plums, and Georgia watermelons are examples.

Butter and Eggs.—For extended periods in the past three years, basic wholesale prices have been pegged through purchases on mercantile exchanges by the Federal Surplus Commodities Corporation. Prices of evaporated milk, cheese, and dry skim milk have also been supported by government purchases.

Market milk.—In a number of markets, prices are fixed directly under orders of the A.A.A. or state milk control boards.

Labor.—Farm wages are not regulated, but are affected somewhat by federal regulation of wages and hours in various industries. Government regulation of wages and hours, together with labor union activity in many city industries, has an important effect upon the costs of things that farmers buy.

Transportation.—Freight, passenger, and express rates on the railroads have been regulated by the Interstate Commerce Commission for many years. More recently, commercial buses and trucks have been brought under regulation, both federal and state.

Telephone, electric power, and gas.—Rates are regulated by state public service commissions, and also by federal authorities with respect to interstate commerce. Water rates are likewise regulated, or the service is supplied at fixed rates by the municipalities.

Coal.—Prices for bituminous coal are now being fixed by the Federal Bituminous Coal Commission.

Gasoline and oil.—Several states have legislation to regulate prices indirectly by restriction of output.

Numerous trademarked and copyrighted articles.—Retail prices are fixed by manufacturers or distributors under authority of the federal Miller-Tydings Law and comparable state legislation, such as the Feld-Hamilton Law of New York State.

So far as I can recall at the moment, milk and coal are the only commodities, other than the recognized public utilities, whose prices are fixed directly by state or federal authorities. It is obvious, though, that indirect price regulation has already been applied to a long list of products, and we are also well along the way toward government regulation of wages.

Now this development of regulated or administered prices has gone on more rapidly in the last seven years than ever before, but the beginnings of it are much further back. The first step was the exercise of control by some individual or group, usually by

N. Y. City Administrator Announces May Milk Price at \$1.58

On June 14, it was announced by N. J. Cladakis, New York City Market Administrator, that the uniform price for May milk is \$1.58 per 100 lbs., testing 3.5 in 201-210 mile zone.

restricting the supply in order to obtain a higher price. In the case of milk, New York City dealers began regulating the purchase price without free competition sometime before 1900. Then in 1916 the farmers took over the price-making job, by collective bargaining. In 1933 the responsibility of establishing milk prices was assigned to the New York Milk Control Board, and in 1938 a coordinated program of joint federal and state control was established.

Direct and indirect price regulation by public authorities has been greatly expanded in the last seven years. Meanwhile the U. S. Department of Justice has been carrying out a vigorous campaign to eliminate private efforts to stabilize or regulate prices. These activities are not contradictory nor inconsistent provided we assume that regulation by public authorities is preferable to regulation by individuals or groups, such as milk dealers, co-operatives, labor unions, etc. There is one glaring inconsistency, however: The Miller-Tydings Law and other legislation to authorize a manufacturer or distributor to require that a stipulated retail price be charged for certain articles, such as books, and well-known trademarked goods, is certainly out of tune with the government's efforts to break up private monopolies.

My next article will deal with the problem of keeping supply and demand in proper adjustment when the price of milk is set with other objectives in mind.

The Potato Situation

Potato markets are still taking old potatoes if the stock is firm, well graded and shows good storage and handling, at prices quite comparable to the price of new potatoes. Most of the actual buying however is done by restaurants because old potatoes make better french fries than new ones.

Practically all of the new potatoes, up to now, have come to our north-eastern markets washed and better graded than usual. The housewives apparently appreciate this washing and grading because retail stores for the most part have handled only new washed potatoes for the last month. Their argument is that the old potatoes did not sell.

The washing of potatoes is something that must be watched by the north-eastern growers. About 40 new washing machines are ready to handle the North Carolina crop which starts to market next week. If all the southern states up to North Carolina have found it necessary to wash potatoes, then Virginia and states north which will be coming on soon will probably find it advisable to do so to hold the market and command the best prices. There will be a lot of objection to washing potatoes in the cooler latitudes of Maine and New York but it is something to think about.

A very wet spring throughout New York state has delayed potato planting, even Long Island was three weeks late. The acreage probably will be about the same as last year. Potato men are not changing their acreage much but many dairymen, with a better price of milk, are planting fewer potatoes. It is too early to give any estimate as yet to acreage since many growers have not planted as yet.—H. J. Evans.

A CRAWLER TRACTOR

DELIVERED AT YOUR FARM

FOR
\$965

CLETRAC MODEL HG

20 H. P. on Belt 2-3 Plow Power on Draw Bar

42 in. Tread, 6 in. Track . . \$965.00

68 in. Tread, 6 in. Track . . \$985.00

42 in. Tread, 10 in. Track . . \$995.00

Here is a tractor that asks no favors. You can plow under adverse conditions. You can plant, cultivate and harvest on time. You can run a mill or feed grinder; you can saw wood; you can pull stumps; you can dig ditches and do other miscellaneous work — whenever you want.

IT PLOWS—2-3 plow capacity for any soil.

IT PLANTS—Accurate steering, positive traction mean straight, uniform rows.

IT CULTIVATES—With "full view" mounted cultivator for all row crop cultivation.

IT MOWS—"Full view" mower has cutter bar ahead of tractor.

The General "Full View"

The New Low-priced rubber tired wheel tractor that does ALL farm work. Delivered on your farm \$650.

1-2 PLOW, 2-row planting, 2-4 row cultivating

The General "Full View" tractor is the wheel tractor that thousands of farmers have sought—a 1-2 plow tractor that plants two rows; cultivates two, four or six rows; that mows a six foot swath; runs the average sprayer or duster; saws wood and does hauling. It is a general purpose tractor of the best construction and at a price to fit your pocket book. The General meets the demands of "one team" farmers yet will handle large acreage as well—and do both jobs efficiently.

TRY the "Cletrac" or the "General" on Your own farm —under your own conditions.

Cletrac Crawlers
for better work at lower cost

By J. F. (DOC.) ROBERTS

COWS and "Dairy Month" naturally go together. At the present time, cows for meat purposes are even higher than they have been, with practically nothing except "old rimmers" and common canners selling below five cents. The great bulk of ordinary dairy cows are bringing five to five and a half, and fat cows are up around six and a half. Good milk calves, weighing around 150 or above, are selling between 10½ and 11 cents, consistently. This gives you two opportunities, both profitable, to see that too much milk is not thrown on the market; namely, cull out the old "boarder" cows, and raise more really good veal calves. There is also a third way: be sure your own family is getting plenty of good milk and cream and that no substitutes for dairy products are used in your own home.

June, and the greatest "livestock" problem of all, is again facing thousands of our American homes. What to do with Betsy or Jimmy, now that they are about to graduate from their local schools? How we hate to cut the ties; yet, if we keep them home, it has been my observation that they are most apt to become glorified hired men and hired girls for Pa and Ma. We must watch that. If they do not go on with their education in the Fall, they usually do not pick it up again. So the vital point is, where and how can they continue their education? And that does not necessarily mean more schools. But they must be so placed that they will be forced to continue to learn. As for college, it can be done. All it needs is absolute cooperation between all members of the family. A great army of boys and girls will be entering college this fall without knowing where their next dollar is coming from, but four years from this June they will be graduates. It's not so simple as that, but cooperation on your part, and determination on theirs, will still do it in America. This is not a guess. I have now had eight years' experience with it.

A wet season and parasites of all kinds thrive. They are already bad. Your animals will be losing flesh and not doing well, if you ignore them. Spray, a free and frequent scattering of lime around the stables, a little old crank-case oil on wet spots, and a cool, dark place to go in the middle of the day, will help tremendously. Sheep and lambs will have to be drenched at least once a month if this wet weather continues, or else you will surely have cause to wonder why they are not gaining and doing better, and then next fall all markets will be flooded with light, thin lambs, with the accompanying price reaction.

Horses are really working right now. Watch your collar fit, keep their shoulders and the collar clean, water them often these hot days, feed three times a day, and remember that 90% of all lameness is in the feet. Keep the foot in shape, the heels well cut down, so that the frog will work with the foot, and keep the hoof comparatively soft. If it gets dry and hard, stand in the mud often. If it gets too soft this wet year, don't wait until hoofs get sore before you shoe, although in ordinary years you do not generally need to shoe. Horses are still too cheap, and it is a good time to buy or trade in.

Recently Elected Cattle Club Presidents

J. W. ALSOP.

At the recent annual meeting held at Providence, Rhode Island, the Ayrshire Breeders' Association elected J. W. Alsop of Wood Ford Farm, Avon, Connecticut, as President of the Association.

IRA G. PAYNE.

When the American Jersey Cattle Club met at Louisville, Kentucky, Ira G. Payne of East Schodack, New York, was elected President. For the past eight years Mr. Payne's Jersey herd has averaged better than 400 lbs. of butterfat per cow per year.

Don't Neglect the Flock in Summer

By JOHN P. WILLMAN,
Cornell University.

TOO MANY persons believe that they can forget about their sheep in the spring after they have been shorn and are turned to pasture. It is true that sheep are able to gather all of their own feed if the pastures are good. It is not necessary to milk them daily as in the case of the dairy cow, and in comparatively few locations is it necessary to bring them to the barns in the evening to protect them against the ravages of dogs. Even when this must be done the flock owner usually has no trouble to teach them to come to the barn if he gives them their salt or a reward in the form of a little grain after they have come to the barnyard. Even though sheep require little care in summer, flock owners are well paid for their efforts if they give their flocks the care and attention they need during the summer months.

Experience has shown that it pays to dip the sheep to control ticks or other external parasites. Dipping is not a difficult job nor is it expensive. A flock that is free from external parasites is able to be a more efficient producer of lambs and wool than a flock that is continually annoyed by these pests. In some of the counties of this state the Farm Bureau organizations have built portable dipping outfits

which travel from farm to farm to facilitate external parasite control. They may dip several flocks in one day. Some flock owners have a small galvanized dipping tank which they set up and do the jobs themselves.

Probably one of the most common causes of unthriftiness in farm flocks is the stomach worm or other internal parasites. The effects of the parasitic infections may not be noticeable until the late summer. The most successful sheepmen do not wait for these symptoms to develop but try to handle and treat their ewes and lambs in such a manner that they do not become unthrifty. They know that unthrifty sheep or lambs do not return a profit.

Many of the more successful sheep raisers are convinced that it pays to divide pasture areas and to move the flock from one lot to another every two or three weeks throughout the summer. This practice not only enables them properly to graze their pastures but also aids in cutting down losses due to internal parasites. Experience has shown that it pays also to give the ewes and the lambs medicinal treatment during the grazing season. These treatments should be started early in the grazing season. Directions for giving these treatments are found in Cornell Extension Bulletin 407.

It should be the goal of every shepherd to bring his flock through the summer with a minimum of losses. A large percentage of his lamb crop should be fat enough and large enough to be marketed at weaning time. The flock owner who provides plenty of "clean" pasture and protects the flock against the ravages of parasites may expect satisfactory results.

4-H Holstein Calf Club Champions

Agnes Pendergast of Skaneateles and Joseph Brill of Ellenville are the Holstein 4-H Calf Club champions for the State of New York for 1939. They are now eligible, along with champions in other states, to compete for the title of National Champion.

Miss Pendergast, now a Senior at Cornell, has been in Calf Club work for five years. Among her show winnings is a second prize at the National Dairy Show. Joseph Brill has been in the Calf Club for six years and at the Ulster County Fair has won twenty firsts and eight second prizes. He is now a student at Cornell University.

"You shouldn't of used an ax to collect money, Mayor. The approved way is tax."

Horses affected with BOWEL CATARRH, minor KIDNEY or LIVER disturbance require more grain . . . can do less work. Dr. Naylor's Tonic For Horses is an effective aid in correcting these conditions.

HERDSMEN FOR "DAIRY WORLD OF TOMORROW."—Front row, left to right: Uriel Simmons, Roy Patten, Eugene Etzel. Back row: Ole Wibholm, Dale Heffington, Chester Steen, Wyatt Finnity. Willard Lashbrook and Wilbur Smith, who are a part of the group that will have charge of the World's Fair herd, are not shown in picture.

These men — part of a group of specialists in the feeding and care of dairy cows, working under the direction of Vere S. Culver, head herdsman — helped make an excellent production record last year at the Dairy World of Tomorrow. Under their care, 137 cows of this prize Borden herd averaged 305 pounds of butterfat for their six months exhibition period at the New York World's Fair — an impressive record in view of the hot weather.

On April 8 and 9, five of these men inspected the Beacon Mill at Cayuga, N. Y. Together with L. S. Riford, president, and Paul E. Newman, dairy specialist of the Beacon Company, they outlined the feeding program for this year's prize herd. And as Beacon Dairy Rations produced such good results last summer, these feeds are being used again this year.

I VISIT PURINA'S EXPERIMENTAL FARM

A few weeks ago I spent a profitable and interesting afternoon on the Purina Experimental Farm about forty miles outside of St. Louis. Here on 530 acres of land, I found 125 steers, 75 brood sows, 170 dairy cows, 4,500 chickens and turkeys, 150 rabbits, 70 dogs, and 150 foxes.

One of the most interesting dogs ever raised on the Purina Farm is Sally who, in a period of eleven years, gave birth to 99 puppies. Her daughter, Sally II, has had five litters of pups, totaling 52, and judging from the signs when I was on the farm, is by this time the owner of litter number six.

The Purina Experimental Farm is in no sense a showplace. Here, under average farm conditions, possible changes in animal rations are studied. As a result, I am told that on the average one improvement a year is made in the Purina rations.

At the laboratory at Purina Mills, I had a new experience — that of seeing some Chinchillas, that small fur animal which at one time was close to extinction. Feeding experiments are being conducted on them, and in time we may have a Chinchilla industry in this country. My personal advice, however, is don't invest.

What would you think of eggs with colored yolks? It is true that black, green, and red yolks do not look so appetizing, but scientists at Purina have found out how to get them, their purpose being to show the public that the quality of eggs is dependent on the kind of feed the hens get. Depending on the feed given the hens, Purina men can tell you what color the yolks will be. What is more, they can break out the egg, pick up the yolk and let the white separate through their fingers; then drop the yolk from one hand to the other without rupturing the membranes that surround it. That is more rough treatment than a lot of eggs will stand.

After visiting the Experimental Farm and Laboratory and meeting many of the men who run Purina Mills, one leaves with the distinct impression that here is a group of men sincerely trying to put out the best rations that science can devise.—H. L. C.

AUTOMATIC COW SPRAYER

In the Pennsylvania Railroad Station in New York City, strangers are amazed when a door, without any apparent rea-

son, opens as they approach it. At the Chicago World's Fair, a drinking fountain, without any visible method of turning on the water, amazed many visitors. When the would-be drinkers stooped to drink, the water just appeared. In each case the person passes through a beam of light which sets an electrical mechanism in motion.

THE SURGE MILKING MACHINE CO., Department A-806, Syracuse, New York has used this principle in developing an automatic fly sprayer. The doorway of the stable is fitted with a yoke of pipes carrying four nozzles. As the cow approaches the door, she intercepts a beam of light which turns on the electric spraying device and the spray hits the cow from all angles. As she passes through, the spray is cut off, to reappear when the next cow starts through.

* * *

A SMALL COMBINE

THE OLIVER FARM EQUIPMENT COMPANY, Chicago, Illinois, recently announced the Golden Grain Master Combine, a new machine with a five-foot cut and containing several new features. Not so many years ago few farmers in the Northeast would have admitted that there was any place here for a combine. However, the development of small machines in northeastern sections, has resulted in a good many enthusiastic users.

CORN FOR LIVESTOCK

It is unnecessary to tell the virtues of corn to any feeder of livestock, but it may well be that you would like to add to your information about corn and its by-products. If so, drop a post card to the **CORN PRODUCTS SALES COMPANY**, 17 Battery Place, New York City, and ask for a copy of "Good Feeds from Corn." The booklet, which is available without cost, also contains a number of suggested rations for various farm animals.

NEARBY MARKETS for NEARBY POULTRYMEN

The Egg Market

By J. C. HUTTAR

AT A TIME when events in Europe have such a big effect on the value of things in this country it certainly seems ridiculous to try to guess future egg prices. I'm not going to try it. One would not only have to prophesy the outcome of the war, but practically its closing date as well. I don't feel up to that job.

Our egg markets particularly, feel the effects of the war during these months when more eggs are produced than people are in the habit of eating. From the latter part of February until August this surplus is usually put into cold storage. Then from about Labor Day until Christmas most of them are taken out and added to the fresh supply and eaten up.

J. C. Huttar

But someone has to have enough faith in values to finance the holding of these eggs from spring until autumn. In order to break even, they have to figure that the eggs will come out of storage with no more than average loss of quality and then bring about 4 cents a dozen more than the going in price.

Before 1930, losses for the storers were not as common as gains, but since then it has been the other way around. Last year was a bad year and some firms were wiped out. So you couple that with the war news and the folks who have money to invest are pretty cautious. That's one reason why the Federal Surplus Commodities Corporation has to make such unusually heavy purchases this year to maintain prices even at these low levels.

Government Holdings

I bring this all up because in judging market values we usually look at storage holdings as one thing which will affect fall and winter prices.

This year's total holdings are about the same as a year ago, but of the total the Government owns about a half million cases.

In the past, the F.S.C.C. has always distributed its egg purchases immediately to families on relief rolls. This year, however, the buying rate got so heavy that they had to store some. Probably most of these eggs will not go into commercial competition.

My understanding is that quite a lot of them will go to school children of needy families in what the F.S.C.C. calls its school lunch program.

There is also a big possibility that a good-sized block will be given to the Red Cross to feed Europe's war refugees. So the storage picture is not bad.

Replacement Stock

I just read the preliminary hatchery report for the country, published by the U. S. Department of Agriculture. This shows a further decrease in hatchings of about 12%.

For the entire hatching season there have been about 15% less chicks sold this year than in the first 5 months of last year. But we have to adjust this deficit somewhat, due to the fact that the per cent of pullet chicks sold is heavier than before. Probably the number of pullets which will be available to replace the present layers will be 5 to 10 per cent less than last year.

But this is a sizable chunk and would make quite a difference in the egg market next year.

So, if it weren't for the dark war situation the outlook for poultry would not be bad.

Quality

In my work of buying surplus eggs for the government, I get around to inspect eggs from all parts of the country. Just lately I haven't had any Pacific Coast eggs, but I did in the winter.

After I buy the eggs each day, I go to the stores of sellers or the railroad piers on the Hudson River, wherever the lots of eggs are located, and make sample inspections of these eggs. It's my job to see that the eggs are of the quality and grade which I buy. Of course, they have been previously inspected by the hired official inspectors of the N. Y. Mercantile Exchange. But since neither they nor I have time to look at every case in every lot purchased, my inspection is just a double insurance against error or fraud.

I have bought over 400,000 cases for the government so far this year. I spend most of my days inspecting, so you see I've looked at some eggs.

Here are some of the interesting things I've seen:

In the winter, up to about April 1, the quality of eggs from all sections is very good. There is not too much to choose.

Pacific Coast and mid-western eggs are practically all uniformly graded, candled and packed in new cases. Eastern eggs are not.

As soon as the first warm days come, however, the quality of the Midwest eggs shows it. This is particularly true of the eggs which have been assembled by hucksters, grocery stores and large shippers. One can almost tell when the hens go out on grass.

So during the winter months we don't get much extra price for high quality, but from about the middle of May on the fine eggs get scarcer and scarcer. Many so-called Nearbys also show the effects of hot days.

It is particularly from now until next winter that the producer who guards the quality of his market eggs should reap his reward.

Some Egg-Packing Tricks

With practice, one person can grade good-sized eggs about as fast as another can crate them. Or, working alone, one can grade and pack a case in half an hour. If it takes you longer, consider these short-cuts. I did and it paid me.

It seems easier to sit down and weigh cleaned eggs into large pans, then crate them. Although they are handled twice, the economy of motions makes the work quicker and less tiring. Weighing goes much faster, and a pan of eggs goes into a crate swiftly when you put in six at a time, three in each hand. Better yet, a second person can crate them.

Try this trick when you have only mediums and standards. In weighing, you naturally pick up an egg with the left hand and have it ready for the right hand which weighs it. So keep an average-shaped 24-ounce egg in the palm of your left hand, held by the fourth and fifth fingers, against the base of the thumb. This leaves the thumb and first two fingers free. When they pick up each egg, your eye compares the two in your hand, and most eggs will not need to go on the scales at all. You know instantly if the sec-

Bert L. Bush, R. I. Marion, N. Y.

and egg is much larger or smaller than the 24-ounce one. You'll do faster work by keeping your eyes on the left hand, not on the egg scales. However, be sure to weigh every egg that is near the size of the model 24, since many will fool you. Round eggs and long ones weigh heavy.

To make speed, don't put your right hand into the pan with every egg you have weighed. Try to place at least two. When you have weighed one that is over 24 ounces, pick up a larger one before reaching to the pan. This saves both weighing and reaching. When you have weighed a medium, pick up a smaller one. It is easy to hand two obviously large or small ones, one at a time, from the left hand to the right. Then put both into the pan at once. Of course, very large eggs can be quickly picked out of the pail by the handful, without thinking of the scales, unless you are grading the Jumbo size.

Remember—keep your eyes off the scales as much as possible. Incidentally, it might pay you to check those weights, 1½ and 2 ounces. Put one of these in your scales, instead of an egg, and see if they are accurate. If your scales do not register ounces, then just remember that 18 ounces to the dozen equals 1½ ounces to the single egg; 24 ounces means 2 ounces apiece. If a two-ounce weight does not raise your scales to the 24 mark, then you are giving overweight since you would have to put on a heavier egg to raise it to 24 ounces. Some scales seem to vary with the shape of the egg; some seem to weigh low around the 18 mark and high near the 24. You may have to allow for overweight or underweight.

Old Orchards Make Poor Range

Is an old orchard a good place for a pullet range?

We don't advise the keeping of pullets in orchards. Pullets need shade, but it has been found that an old orchard is an excellent place for the type of small insect known as slugs. These act as intermediate hosts for certain parasites, and if the chicks pick them up, they become infected with the parasites. Good range shelters on a clover or alfalfa sod make a better place for raising pullets.

Crooked Breast Bones

Are crooked breast bones the result of early roosting, or is there some other cause?

Early roosting may have some effect, but we think it is one of the least important causes. Probably the two most important causes are an inherent tendency to crooked keels and the absence of vitamin D and minerals in the ration.

"Elsie, is Paw goin' huntin', or did he hear about my folks comin' for a visit?"

Give Vegetables A BREAK!

BY MRS. GRACE WATKINS HUCKETT

THERE is nothing sadder in the way of food than a poorly prepared vegetable, cooked until it has lost all of its flavor, form and color, not to mention its valuable vitamins and minerals. But just let us take some freshly gathered vegetables from the farm garden, treat them with the respect that they are entitled to in the kitchen, and oh! what a difference in the reception the family gives them at the table.

Vegetables are cooked a far shorter time, and in much less water, than formerly. Garden peas, added to just enough boiling water to cover, will cook in 7 minutes over a good fire, and will keep their flavor and color. Fresh, tender green string beans (which an old cook book recommends cooking for 4 hours!) are at their best when cooked in boiling salted water for not more than 20 minutes.

General rules for cooking all vegetables are:

1. Have water boiling when vegetables are put in.
2. Bring water back to boil as quickly as possible.
3. Stop cooking as soon as tender.
4. Serve as quickly as possible after cooking.
5. Season simply, with butter and salt, and pepper if desired. Other seasonings are spices, curry powder, paprika, bits of bacon or salt pork fried crisp, or sauces.
6. Make use of the liquid in which vegetable is cooked—in sauce, gravy, or save for soup.

Keep Their Color

To keep vegetables GREEN during cooking, remove the cover so that the acid which turns the green coloring brown may escape with the steam. Soda would preserve the green coloring by destroying the acid, but it also destroys vitamins B and C; therefore its addition is not recommended. An easy, tasteful way to cook greens is by panning them. Melt fat in skillet, add chopped greens, cover to keep in steam and cook until tender—15 to 20 min. Remove cover when greens are thoroughly wilted. Sprinkle with flour, mix well, pour in milk or cream, season with salt and pepper. In this way the food value and flavor are kept, while the food value of milk enriches the dish.

Yellow vegetables, an important source of Vitamin A, do not lose color easily in cooking. These are typified by carrots, sweet potatoes, yellow squash, yellow corn and yellow turnips. In cooking yellow vegetables, the general rules applying to all vegetables apply to them.

Red color in vegetables is preserved by addition of acid, vinegar or lemon juice, either during the cooking period or as a sauce afterwards. In the case

A vegetable loaf utilizes small quantities of vegetables in a delightful way. For the recipe for this dish read "Vegetable Loaf" in the box in column four on this page.

of beets, the red color "bleeds"—hence two or three inches of the top and all of the skin should be left on while the beets are being boiled. Or they may be diced small and baked in a covered casserole with almost no water to dissolve their pigment. Young, tender beets cook quickly this way.

Vegetables should be used as soon as possible after harvesting, not only so that they can be enjoyed while still crisp and fresh, but also to prevent loss of vitamins and flavor. Such vegetables as asparagus, green peas and corn lose greatly in sweetness if they stand as much as six hours before being used. Standing in water to freshen also dissolves away valuable minerals. It is better to wash vegetables and then let them stand in the hydrator in the refrigerator or in some other cool place to freshen. Green peas, carrots, squash, onions and some other vegetables containing sugar lose their sweetness if allowed to stand in water, because their sugar dissolves in water—both in washing and in cooking. Therefore steaming is better than boiling these particular vegetables.

Vitamins also are lost through cooking vegetables in too much water, or through too long boiling, too much stirring, or sieving them while hot. Cooking young vegetables in their skins helps to prevent loss of flavor. Old ones have to be cut up in order that their woody fibers may be softened by the water or steaming.

One of the best ways to serve vegetables is in the form of salads, for then there is no loss of vitamins or minerals in cooking. The simpler the better for such salads. Take these, for instance: shredded cabbage with grat-

—PHOTO COURTESY CORNING GLASS WORKS.

ed carrot, thin slices of cucumber and chopped green pepper; grated raw rutabaga and chopped celery; slices of tomatoes and cucumbers on lettuce garnished with onion, radishes, green pepper rings or water cress. The cardinal rule for salad making is: Have the materials and the plate cold; crisp the vegetables; and combine with dressing just before serving.

For your delight during the current season of abundant vegetables, here is a collection of "H.R.'s" favorite vegetable recipes:

Polka Dot Corn Soup

1 pint corn (cooked in water until tender)
1 pint rich milk
1 teaspoon salt
Pepper to taste
2 tablespoons chopped sweet peppers (green and red mixed)

Serve hot with toasted cubes of bread.

Carrots and Corn

6 young carrots
Corn from 6 ears
1 cup thin cream or top milk
1 teaspoon salt
Pepper to taste

Scrub and dice carrots. Cook 20 min. in salted water to barely cover. Add corn, simmer until tender, add cream or top milk and season to taste.

Country Lettuce

1/2 cup sweet cream
2 tablespoons sugar
1/2 teaspoon salt
2 tablespoons vinegar
Dash of pepper
Shredded onion

Pour over shredded lettuce and onion just before serving.

Paprika Fritters

2 cups cooked corn
2 beaten eggs
1 teaspoon salt
1 cup cracker crumbs
1 teaspoon paprika

Drop in little balls in deep hot fat and fry 'till brown.

Carrots in Cheese Sauce

10 medium carrots
1 cup medium white sauce
1 tablespoon chopped parsley
1/2 tsp. salt
Pepper
1 cup grated cheese

Cook carrots in salted water until tender. Drain, add white sauce well seasoned, grated cheese and parsley.

French String Beans

4 tablespoons butter (lightly browned)
1 tablespoon butter
1 pint cooked cut string beans
Egg slices

Brown 4 tablespoons butter lightly,

add 1 tablespoon butter. Pour over stringbeans cooked in salted water and drained. Garnish with hard cooked egg slices.

Peppy Beets

12 small new beets

Sauce

1/2 cup mild vinegar
2 tablespoons sugar
1 teaspoon salt
1 teaspoon prepared horseradish
1 tablespoon butter

Cook beets until just tender. Skin and heat for 10 minutes in sauce.

Health Salad

On large platter place attractive piles of sliced cucumbers, turnip sticks, carrot rounds, cauliflower flowerets and tomato wedges. Place little cups formed of leaves of lettuce filled with mayonnaise about as a garnish. All ingredients should be young and crisply cold. A crunchy salad for children.

Fried Squash

Slice young patty-pan squash in 1/4 inch slices. Season well with salt and pepper, a dash of nutmeg. Fry in hot bacon fat until deep brown.

VEGETABLE LOAF

A vegetable loaf utilizes small quantities of vegetables in a delightful way. Here is a suggested recipe:

3 tbsps. melted butter or other fat
2 1/2 cups soft bread crumbs
1 cup diced cooked carrots
1 cup canned peas or string beans
1 teaspoon salt
1 cup chopped cooked celery
1/2 cup chopped nuts or
4 tablespoons peanut butter
4 tablespoons liquid from cooked vegetables
2 eggs beaten
Pepper

Mix fat with crumbs; reserve about one-half cup for top of loaf. Mix all ingredients; put into casserole; cover with crumbs; bake in moderate oven 30 minutes. Serve with tomato sauce. May garnish with fried mushrooms and crisp bacon.

CASH CONTEST

SOME cooks have a magic way with vegetables, and like "H. R." (whose interesting vegetable recipes we have been printing for years) are able to combine imagination with proper cooking methods. If you have a favorite vegetable dish recipe of your own, send it to us. We will pay \$1.00 each for the best five recipes sent us, 35 cents each for every other recipe that we can use. Address your letter to Home Department, American Agriculturist, Box 367-R, Ithaca, N. Y. Letters must be mailed not later than July 6th.

Milk Desserts and "PICK--UPS"

ROSES, blushing brides, and sweet girl graduates used to be most typical of the month of June, but the dairy cow is now taking the spotlight away from them. June has become Dairy Month, and from coast to coast Americans, young and old, are being urged to use more milk for health's sake.

Whether you're looking for glamour or vitamins, for a better complexion or stronger teeth, for minerals or for just good tasting foods, "milk is your man" say food experts. An adequate amount of it in the diet, declares Dr. H. C. Sherman, professor of Chemistry at Columbia University, "has a striking effect of improving physique and general health, and increasing mental alertness."

To help you use more milk this summer, here are some of Mrs. Hockett's delicious tested recipes for desserts, sauces, and milk shakes:

Vanilla Refrigerator Ice Cream

1/2 cup sugar 2 egg yolks
1/4 cup white syrup 2 egg whites
1/4 teaspoon salt 1 teaspoon vanilla
1/2 cups milk 1 cup whipping cream

Set aside two tablespoons of the sugar. Heat the rest of it with salt, syrup and milk to the boiling point and pour gradually over the slightly beaten egg yolks. Cool and freeze to a mush. Beat egg whites until stiff, add the 2 tablespoons of sugar. Beat the cream until just stiff and add it with the vanilla to the beaten whites. Mix both thoroughly with the partly frozen custard; finish freezing. If this recipe is used in a crank freezer, it is not necessary to separate eggs nor to whip the cream in advance, since rapid turning of the dasher beats in air and also tends to smoothen the mixture.

Variations: Chocolate Ice Cream: 2 oz. (2 squares) chocolate or 6 tablespoons cocoa stirred into hot milk after the mixture is smooth and thick.

Banana Ice Cream: Add 1/2 cup banana pulp, 2 tablespoons sugar, and 2 tablespoons lemon juice to the mixture.

Toppings: A teaspoonful of any good marmalade or jam and a sprinkle of chopped nutmeats if desired.

Peach Sorbet

2 cups water 8 peaches
1 cup sugar 1 tablespoon lemon juice
1 cup top milk 1 cup whipped cream

Boil water and sugar 5 min. Peel peaches, slice and run through a sieve. Add to syrup with milk and lemon juice. Freeze to a mush, then fold in the whipped cream. Let stand 1/2 hour and serve in glasses.

A great field for imagination and ingenuity is the group of beverages using milk as a foundation. Just plain, cold milk is a great refresher; often the addition of material already at hand lifts the drink out of the commonplace. Left over fruit juices or sieved fruit, canned or fresh, maple syrup, a

sprinkle of cinnamon or nutmeg, a dash of lemon or orange juice or gingerale or charged water—one can have her own soda fountain at home!

Beverages

Milk Julep: Mix in a beverage shaker 3/4 glass milk, 2 tablespoons of fruit or chocolate syrup and one egg.

Honey Blossom: To one glass of milk, add 3 tablespoons extracted honey and a few drops of lemon or orange extract. Shake or mix thoroughly.

Chocolate Pick-Me-Up: Add 2 or 3 tablespoons chocolate syrup or paste to 1 cup of milk, add egg or egg white if desired. Sweeten to taste, stir and serve in tall glasses.

Maple Fizz

1/4 cup maple syrup gingerale 1 quart milk

Add maple syrup to milk and mix well. Pour into tall glasses and fill with gingerale. Serves six.

Raspberry Milk Cocktail

1 pint raspberries 2 cups water
or other berries 1/2 cup sugar

Heat the berries and 1 cup of the water together for about 5 min. and strain. Mix the other cup of water and 1/2 cup sugar and boil for 10 min. Add the two mixtures, heat thoroughly and bottle to use as a syrup. To each glass of milk, add two or three tablespoons of this syrup.

Caramel Milk Shake

1 teaspoon brown sugar 3/4 cup milk
1 tablespoon caramel syrup 1/8 teaspoon vanilla
dash of salt

Mix, shake well and serve cold either plain or with a spoonful of whipped cream on top. To make caramel syrup, melt one cup sugar in a dry pan until brown and smooth; add 1 cup water, stir well and boil 3 minutes. Cool, bottle and use for flavoring milk drinks and dessert.

Chocolate or Cocoa Syrup

1/2 cup cocoa 1/4 teaspoon salt
1/2 cup sugar 1 cup boiling water

Mix cocoa, sugar and salt in a saucepan. Add boiling water gradually and cook gently 5 min. until a smooth thick paste is formed. Cooking in a double boiler for 20 to 30 min. improves the flavor of the syrup. Put in a covered glass jar and keep in a cold place.

Chocolate Eggnog

1 egg 3/4 cup cold milk
1 to 2 tbsps. chocolate syrup few grains cinnamon

Beat egg slightly, add chocolate syrup, milk and cinnamon. Beat well, strain and serve.

Apricot Eggnog

2 eggs 1 No. 2 1/2 can (3 1/2 cups)
2 1/2 cups milk apricot halves
Few grains salt

Beat egg yolks until thick and stir in milk gradually. Add salt and sieved apricots and juice and fold in the stiffly beaten egg whites and pour into tall glasses. If desired 1/4 cup of apricot pulp may be reserved and folded into whipped cream for garnish. Serves six.

A Cool Drink for Hot Weather

A good hot weather drink and one which is very colorful is cranberry punch. This is how it is made:

Cranberry Punch

1 can cranberry sauce 1 cup orange juice
2 cups water 1/2 tablespoon lemon juice
gingerale

Stir cranberry sauce and water together over a low heat until the sauce is dissolved, then remove from heat. Cool and strain. Add the cold fruit juices. Just before serving, add gingerale.

IF YOU LIKE BREAD WITH GLORIOUS OLD-FASHIONED FLAVOR TRY MACA YEAST!

New Fast-Acting Yeast That Keeps Without Refrigeration Gives Bread The Rich, Old-Time Flavor Men Love

IF YOU WANT to learn a priceless secret about baking bread with the kind of old-fashioned flavor men really "go for"—try *Maca Yeast* the very next time you bake. Here's a yeast that's winning new friends every day, because it *acts fast and keeps without refrigeration*. But the most *important* reason women use *Maca Yeast* again and again, is that it gives bakings the rich, delicious flavor that brings back old-time memories.

Remember the glorious treat you knew was in store when mother baked bread in the old family kitchen? Remember the aroma that told you those nut-brown loaves were soon to be taken out of the

oven? Remember the flavor of those feather-light loaves? Well you can be sure that every red-blooded man has the same fond memories—memories that easily are awakened with bread or rolls you can easily make with *Maca Yeast*.

It's easy to use *Maca Yeast* too—*nothing new to learn!* Just follow your favorite straight dough recipe. But think of the convenience of keeping *MACA* on the pantry shelf, *with no worries about refrigeration!* And don't forget: *MACA* is ready to go to work right after you stir it in a cup of lukewarm water!

Until you've used *Maca* it's pretty hard to realize what a remarkable difference this new yeast makes in baking. So try it the *next* time you make bread or rolls. You can get *Maca Yeast* at your grocer's.

maca YEAST

NORTHWESTERN YEAST COMPANY, CHICAGO, ILL.

EAT MACA, TOO In addition to its baking use, of course, *Maca* can be eaten. It contains vitamins B₁ and G and the other vitamin factors of yeast, all naturally present.

ADVISES YOUNG GIRLS ENTERING WOMANHOOD

Thousands of young girls entering womanhood have found a "real friend" in Lydia E. Pinkham's Vegetable Compound to help them go "smiling thru" restless, moody, nervous spells, and relieve cramps, headache, backache and embarrassing fainting spells due to female functional irregularities. Famous for over 60 years in helping "women's" functional complaints. Try it!

Note: Pinkham's Compound comes in either liquid or handy to carry tablet form (similar formula).

HOW WE SPENT THE FOURTH

By C. A. STEPHENS

IT WAS the morning of the Fourth of July. There was to be a celebration at H——.

The writer — then a lad of twelve — and one of his boy friends, named Ned Wilbur, set off at four o'clock in the morning so as to be at H—— early, for we expected a delightful day and wanted to be in season to enjoy all the sights. The distance was fourteen miles. Neither Ned nor myself had ever been to H——.

We were farm boys, very green and unsophisticated in the ways of the great, naughty world. This little journey was, in fact, one of our first straying-forth from the home neighborhood. Ned was thirteen years old.

I recollect wearing a jacket of gray-green homespun and pants of the same. But Ned was more stylishly arrayed. Instead of his home-made frock, he had put on his older brother's yellow linen coat, or "duster". It was much too long for him. Despite his straightening up, and the wads of felt that he had put in his boot-heels, the coat came well down to the ground.

Ned had twenty-nine cents to spend, and I had twenty-three. We had each set aside six cents to purchase baker's crackers and smoked herrings for our dinner. The remainder of the money was to go into snap-crackers and patriotism generally.

We did not sleep much the night before, and taking a very early breakfast, set off, as I have said, at four o'clock. As we hurried on, we saw that the country was getting its eyes open. Guns were fired here and there. We heard a cannon booming in the direction of the town. The reports set us half frantic with enthusiasm, and caused us to see visions of the martial splendors of the coming day.

H—— is a village of perhaps eight hundred inhabitants. We reached it between seven and eight in the morning. I recollect that we were half frightened as we entered the main street; but seeing a crowd of boys and men and big dogs in front of one of the shops, we drew near and edged in among them.

The attraction for the moment was a large Newfoundland dog that would hold a snap-cracker on his head, or rather, allow it to be fired lying on his nose. After it had snapped, he would bound and bark and frolic with delight. His master, a boy of about our own age, stood looking on with pride.

But this prodigy was eclipsed by a greater. A thick-set, freckled-faced boy, of thirteen or fourteen, deliberately lighted a cracker, placed it between his teeth as if smoking a cigar, and let it explode. It seemed wonderful to us that he remained unhurt. We eyed that freckled face and stub nose with amazement mixed with awe. I think I should today recognize that hardy youth in any clime or under any flag.

But a still jollier feat attracted our attention. A boy, evidently the owner of a full purse, took a whole bunch of crackers, lighted one end of it, and then turning an old tin pan over it, sat down on the pan. Such a snapping and cracking as followed from under the pan, and such shouts of applause and laughter as greeted this feat, published it the whole length of the street.

Several old farmers in their staunch, thoroughbred wagons, paused in the road to see the fun. One red-faced man, with a beard like rye stubble in December, laughed loudly from under his vast new palm leaf hat and urged his old horse, which had a little mouse-colored colt hitched to the thill, up into the skirts of the crowd.

But it was a tricksey crowd. While in the midst of his great laugh, "snap" went a cracker under his very boots. Somebody had thrown a handful of lighted crackers under his wagon-seat.

The farmer jumped, the old horse jumped, and the colt jumped. Off went the crackers, "rap, rap, rap." Up blazed the straw in the bottom of the wagon! Stamp, stamp went the man's cowhide boots, treading out the fire!

The crowd roared with laughter. But the old fellow was very angry. Grabbing his white oak whip-stock, he flourished it menacingly; then giving his horse a cut, he drove off without looking back.

This was not a very proper prank; but it set Ned and me laughing to such extent that we bent half double to keep from roaring outright. While we were laughing, "whack" went a cracker under the skirts of Ned's long "duster."

He leaped as if touched with a needle. "Crack, crack," went off two more. Ned whirled to see where they were. "Snap, snap, snap," went a half dozen at once. They were in his coat.

Someone had dropped at least half a bunch in one of the side pockets of the "duster". Ned tore and fought to put them out. Round and round he whirled and jumped.

The crowd, hooting and hawhawing, formed a ring about him. "Whack, whack," spoke the crackers. Fire burst out of the pocket, and the more he whirled, the more it blazed. In short, it burned off the whole side of the thin "duster" before he could put the flame out.

I say before he could put it out; for I was so dazed by the calamity and by the outburst of public attention which it drew that I could do nothing but stare at his antics.

As for Ned, he was wild with excitement and anguish of mind at the thought of returning home with the ruined "duster". He charged the trick upon not less than a dozen different

boys, each of whom denied it and laughed the louder. To escape the popular admiration which the sight of the burned coat inspired, Ned at length took it off and, rolling it up, carried it under his arm the rest of the day.

Shortly after this, a little urchin secretly pointed out to us a boy in a checked jacket and military cap as the one who had put the crackers in Ned's pocket. We watched that "soldier cap" for the rest of the day.

Just then a voice cried, "The Fantastics had come out!" There was a rush down the street to meet them. We followed the crowd.

A chorus of braying horns and rattling pans announced the appearance of these public humorists. I had never seen a mask till then, nor had Ned.

At the head of the "fantastic" troop, on a lame, rawboned white horse, rode a terrible being, the first sight of whom fairly petrified me with astonishment, not unmixed with terror. Like the great dragon, he was clad in flaming red, and bore a sword fully ten feet long, which he fiercely brandished.

Behind this fearful creature rode other mounted oddities, all grotesquely masked. A rack-cart, containing what purported to be a negro minstrel troupe in full performance, brought up the rear. Drums and horns kept up a tremendous confusion.

It must be remembered that I am describing all this as it looked to a boy's eyes.

Up and down the street rode the "fantastics", greeted everywhere with shouts of laughter. Suddenly, as the procession was passing the spot where a crowd of boys were gaping at the spectacle, the great dragon on the white horse leaped off and rushed at us with a frightful shout. I may safely say that I never was so scared in all my life. I was fairly blind with terror, and ran against everybody. Once the monster got his paw on me; but I sprang frantically away from him. If he had caught me, I think I should have died of fright.

The next thing I knew, I was among a group of young ladies. They wore expansive skirts in those days. Clutching madly at one of these skirts, I ran round and round it, twirling the occupant with me. A parasol was vigorously applied to my head, and the young woman cried, —

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Green Fields

Green fields hold all of life for me,
Green fields where cattle stand
And idly chew their cud or graze —
Green fields on every hand
And brown fields, too, hold much of life
For those who love the sod,
Who sow the seed and leave it then
To sun and rain and God.

Green fields hold all of life for me,
Green fields I love, and brown;
They hold the peace that cannot dwell
In city or in town.
Oh, acres wide of green and brown
You speak of wind and sun,
Of planting time and harvest time
And work that must be done!

—Ruth M. Haswell, Delmar, N. Y.

"Let go! Let go of me, you little tyke!"

I stared at her with imploring eyes. "Why, don't be afraid of him, bub," said she, after another look at me. "It's only Tim Jones dressed up."

The dragon had gone.

They were all looking at me and laughing. I slunk away, feeling very sheepish. Ned was waiting for me, grinning, at a little distance.

"Never run headfirst among a mess of girls," said Ned. "But come along; the fellows are all going down to the pond. They are going in swimming."

Down to the pond we all went, and soon the water was full of white and yellow-skinned boys, each of whom had left his clothes on the sand.

We had not, however, lost sight of that "soldier-cap". While the boys were in the water, a short distance from the shore, Ned was guilty of an act, which, as I look back upon it today, I cannot commend.

Coming ashore, he took one of "soldier-cap's" shoes, put a stone in it, and tossed it out three or four feet of water. It sank.

When the owner came to dress, he naturally missed his shoe, and there was no small stir about it. We left him, with one foot bare, searching for it. Served him right, we thought.

After eating our smoked herrings and dry baker's crackers, moistened by a glass of lemonade, we invested our remaining funds in snap-crackers and torpedoes, and settled down to the enjoyment of popping them, one at a time.

By four o'clock we were to have started for home; but learning that fireworks were to be set off in the evening, our anxiety to see the display overcame our prudence.

It was not, however, without some ugly misgivings that we saw the sun about to set and thought of the long miles between us and home; for much of the way led through woods and half-cleared tracts. A heavy-shower, too, had risen in the west and was passing with tremendous thunder peals off to the eastward; and other clouds lay in a dark bank in the southwest.

But our intense curiosity kept us waiting; and, indeed, we had to wait till past eight o'clock. It had grown dark, and the rockets, going up one after the other, did really make a very pretty spectacle. The enjoyment of the sight made us forget both our anxiety and the fatigue of the long day.

To make the most of the fireworks,

The Song of the Lazy Farmer

THERE ain't a thing that puts the vim in me like goin' for a swim, I like to go down in the crick behind the willows, growin' thick, and dive into the swimmin' hole, and splash around a while and roll. It cools my head and cools my back, when I git feelin' tired and slack a swim just peps me up again, it's good for any ache or pain. If I were someone else, I'd wish that I could just be born a fish, all thru their life they never sweat, but swim around where it is wet, there ain't no livin' creature that is half as happy where he's at as fishes, they have got us beat, and if they ain't got hands or feet they've got the finest place to live, so both my hands and feet I'd give and never have another wish if I could only be a fish.

The next best thing to soothe my soul is this here ample swimmin' hole, I pity folks in places where there ain't no crick to wet their hair, there ain't no place to dive nor jump.

their water all comes out the pump. They crowd into a little tub to take a bath, and tho they scrub, the satisfaction isn't there, they haven't got much room or air. I like to do my bathin' out, where I can dive and splash and shout, or maybe sit awhile and soak and watch the squirrels play in the oak. A feller surely likes a swim to soak the meanness out of him, it mellows up your hide and soul, a-floatin' in the swimmin' hole.

those in charge set them off very slowly, so that it was near ten o'clock before the last rocket was lighted.

Ned then drew a long breath. "Come on," said he; and we set our faces homeward.

It was so dark that we had almost to grope our way out of the town. Thunders were muttering all around the skies. But we had no acquaintances with whom we could stop in the village. We had not even a copper left. Home was the only haven left us.

For the first mile we went at a dog-trot; but our feet, blistered by walking and standing all day, were so sore that presently we settled into a walk, which ere long changed into a limp. How we kept the road and made the right turns, I cannot now quite explain; for it was so dark we could not even see the bushes alongside the road.

At length, the lightning began to play across the sky, and the thunder to roar heavily. The flashes lit up the country, far and wide, but instantly left us in utter blackness. The claps of thunder made the ground tremble.

Another shower was coming. The day had been very hot and sultry. Presently it began to rain and hail. By a flash of the lightning we caught a glimpse of a building a little way ahead, and ran towards it, struggling with the mighty gusts of wind.

Another flash showed it to be a barn. We ran to it. The great doors were in the end next the road. Ned pulled away the prop which held them together, and we crawled in.

Scarcely were we inside than something seized Ned by the neck and left shoulder with a frightful grip. He jumped and screamed, —

"Help! Murder!"

Scared half out of my senses, I pushed open the door and leaped out into the rain, and after a hard struggle and much kicking, Ned got away and came tumbling against me.

Personal Problems

Love . . . or Loneliness?

Dear Lucile: I am twenty years of age, with more than a high school education. So far in my life I have had very little chance to make acquaintances and cultivate friendships with the opposite sex. My parents are kind and loving, but usually disapprove of boy friends—no matter whom. That is the reason why I wish the unbiased opinion of a stranger. This problem is so vitally important to me.

Two months ago, while working away from home, I met a man a few years older than I. He is a clean, wholesome man, but since childhood has had the use of but one eye. However, his kindness and consideration for me make me overlook that. He is able to earn a living, but so far has stayed at home with his parents, being the last of a large family to marry.

I have enjoyed his friendship and value it highly. A short time ago he told me of his love and his hope of our marriage in the future. I told him I did not care enough for him now to give an answer and that I thought it better to discontinue our friendship. He admits that I am right in not considering marriage at my age, but declares his willingness to wait if only I will allow him to come to see me frequently and will give him some definite promise as to the future.

I want to do what is right and fair to him, for I believe he sincerely cares for me. Sometimes I wonder if I could ever care enough for him, or if it is only this man's friendship which has made my life less lonely. My question is: Is it fair to this man to continue our relationship, knowing that I may never care for him as he wishes? I will have to give him some sort of answer soon. Please suggest the fair and square thing to do.—*Mae*.

In considering your case, I should think you might carry out a part of your friend's request, that of allowing him to call frequently, but I would not feel obligated to give him a definite promise as to the future. That would be the same as an engagement between

FORGOTTEN

By Gordon Thomas.

Deserted houses in this place
Mask loneliness in quaint disguise,
With window boards across each face
Like fingers held to tired eyes.

Just then we heard a little colt whinny in the barn, and we guessed in a moment that it was a colt's mother that had collared Ned.

Not caring to brave another contest with a mare's teeth in the dark, we ran to the lee of a stack of straw, which had stood exposed through the winter. Digging into the south side of it, we got in a little way under the stack. It rained for more than an hour in torrents; yet we managed to keep most of our bodies dry.

"Might as well stay here till morning," Ned said; and I do not recollect much more that night. We were utterly tired out and demoralized.

The sun was shining when I waked up. We crawled out, feeling stiff and sore enough, and hungry as young tigers. We were covered from head to foot with mud, wheat beards and chaff; but Ned had kept hold of the burnt coat through all the perils of that eventful night. We set off for home again, and had gone about three miles when we saw a horse and wagon coming. It was Ned's father and the writer's grandfather, coming to look us up.

"We shall catch it now!" said Ned.

But they did not say much to us, save to bid us get into the back part of the wagon; and after we had given an account of our adventures, they contented themselves by saying that "they hoped it had learned us something." It had. We felt very wise in the ways of the world for a long time afterwards.

you, and that, as I understand it, you do not want.

Certainly this young man's affliction should not count against him since he has shown his ability to earn a living in spite of it, but since you are young and as you say, have not met many young men, I think you are wise in wanting to wait until you have met a few more before promising this first one with whom you have had your first close friendship.

In the meantime, you could fairly continue your friendship, I should think, making it clear to the man that you are doing so on a 50-50 basis — a chance that you might learn to care for him, but an equal one that you never could.

You Have No Obligation

Dear Lucile: I am a girl of 25 years and for the last five years one of our neighbor boys has hung around me. But

"Oh, nothing much, just sitting here looking at your picture."

he only takes me out eight or nine times in a year and whenever he does take me he always takes his sister along and she always seems kind of jealous of me. When they go to their relations they never take me along, not even when there is a party, but if I go to any party without them they get terribly jealous of me.

Because this neighbor boy always hangs on me my father won't let me go with other fellows and for this reason I feel like leaving home so I can go with other friends. What would you do if you were in my place? I like this neighbor boy but I do not like it that he takes me out so seldom and then when I go anywhere he gets so jealous.—*M. K. H.*

As long as this neighbor boy takes you out so very seldom and since you have reached the age where you can rely on your own judgment as to what you wish to do I can see no reason why you should not go with others when they ask you. Certainly as long as you are not engaged to this boy and owe no obligations to him or his sister I do not think you need worry about how they act when you accept invitations from other folks.

Grange Cleanings

(Continued from Page 7)

home in New Britain of Albert P. Marsh, long-time worker for the Order and a visitor at some time in nearly every Grange hall in Connecticut. For a considerable period Mr. Marsh served on the legislative committee of the State Grange. He was a vigorous figure at the State Capitol in Hartford and was one of the group of leaders who several years ago successfully conducted the campaign to "Get Connecticut Out of the Mud," which resulted in an annual appropriation of \$3,000,000 for improvement of rural highways of the state.

* * *

PONKAPOAG JUVENILE, No. 42, in

Massachusetts, is very proud of the fact that twin boys in its membership occupy the respective stations of master and overseer. They are Robert and Roy Gelpke and are so identical in every feature that should they change stations at some meeting probably none of their fellow members would be aware of the shift. Both are promising boys who love their Juvenile and are eager to make it function successfully.

Good Books to Read

I Married Adventure,

Osa (Mrs. Martin) Johnson.

When as a Kansas schoolgirl Osa Leighty thought of the future, she never dreamed that it would include marriage to Martin Johnson and 20 years of life and adventure in dangerous jungles in all corners of the world. On their first expedition to Borneo, armed with old, clumsy photographic equipment, they narrowly escaped being the chief ingredients at a cannibal feast, and between their first and last trips they encircled the globe six times. Their equipment gradually changed to the most up to date types available, and by means of airplanes they were able to picture parts impassable by road. The whole book is a lasting memorial to the world's greatest photographic explorer.—*J. B. Lippincott Co., Philadelphia, Pa. \$3.50.*

Good Movies to See

EDISON, THE MAN. Spencer Tracy portraying the conquests of genius, the wonder of what one man did to benefit the world.

FLORIAN. Near old Vienna was a farm where the Emperor Francis Joseph's white Lippizan horses had been bred for generations. There a colt is born, with all the perfections for which his ancestors had been famous. The picture is built around the fortunes of this colt. The story of the picture is written by Felix Salten, well known as the author of "Bambi."

Smart and Slimming--

SLIMMING lines, particularly princess effects, usually with flaring skirts, continue to hold first place and are charmingly interpreted in prints. Big dogwood blossoms, colonial bouquets, stripes, scrolls, fleur-de-lis plumes and polka dots in every conceivable size and shape, are some of the very popular prints.

A perky bonnet or bonnet-type hat, mostly flowers, makes a charming part of such a costume. Jackets, whether cut out of the same or matching material, or of contrasting, add another note of femininity. Besides, they are extremely practical.

PRINCESS DRESS BOLERO PATTERN No. 3184 exemplifies extreme good style features. Edge the sweetheart neck and cuffs with crisp lace for added femininity. - Sizes 12 to 40. Size 16 requires 3½ yards of 39-inch material for dress; 1 yard for bolero.

LITTLE GIRL'S FROCK PATTERN No. 3297 also emphasizes the slimming lines. Furthermore it buttons all the way down the front to help the small person who is learning to dress herself. Patterns for the delightful applique and for the panties are included. Sizes 2 to 8. Size 4 requires 2¼ yards of 39-inch material for dress and panties.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, N. Y. Add 12c for a copy of our new summer fashion catalog.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

EXCEPT for "the shootin'" which may begin any day, this country is actually at war. We have already begun the complicated and cumbersome task of mobilizing a democracy. Before we are through with it we will find that this mobilization is a painful and exceedingly uncomfortable process. The experience may toughen us and harden us as a people, but we aren't going to like it.

Extreme Centralization

After the fashion of the day, we shall move rapidly—much too rapidly I am afraid—toward extreme centralization of authority in the hands of a few executives. For one, I shall not object to the loss of the personal liberty such centralization entails, provided (1) that power is centralized in the hands of competent, patriotic men; (2) that it is not used for political purposes; (3) *that when I become a party to any delegation of authority over my individual liberties a method of returning the freedom which I am giving up for the period of the emergency is also worked out in advance and agreed upon.*

Cases in Point

For example, I can see the federal government taking over the control of all radio stations. I shall not object. But I would like to insist that before we permit our government to take such a step we also commit it, and even work out the details, to hand back the stations to their present owners at the earliest possible moment.

Here in the Northeast we have the strongest, most effective system of county farm and home bureaus in the country. *They are strong and effective because they are largely controlled by local committees of farm men and women and largely financed by local funds.*

I can foresee the Secretary of Agriculture demanding the federal direction of farm and home bureaus in order to deal with food problems. County associations, whether they like it or not, may have to stand aside for the federal government. If this issue ever arises, however, I hope that every county farm and home bureau committee in the country will demand an agreement from the federal authorities *to return the bureaus to their present degree of local control at the first opportunity.*

Fighting for Democracy

"Short of shootin'" we are already in the present war because we believe in the maximum of individual freedom and in the ways of a democracy.

One thing we must not do is to give up what we are fighting for in order to make an effective fight.

It is conceivable that we shall most effectively protect democracy

if we insist on the maximum of democratic procedure, even when we are fighting.

APOLOGY

I am in receipt of the following letter under date of June 8, 1940, from W. C. Muenscher, Professor of Botany and Weed Specialist in the Experiment Station at Cornell University:

"I have read the *American Agriculturist* for years. Sometime ago I subscribed for it in order to have it to refer to when I receive inquiries or questions raised by your discussions on your page on 'Kernels, Screenings and Chaff.'

"In the June 8, 1940, issue, page 22, under the subject 'Yellow Rocket and Mustard' you make a statement that is rather misleading. Referring to 'whether or not mustard seed which went through a silo would germinate, you state that 'no one at the College of Agriculture could answer this question.' I assume that this reference is to the New York State College of Agriculture.

"Now since I do not know to whom your inquiry was directed, I cannot say where this unfortunate 'slip up' occurred. Had your inquiry come to my attention, I should have informed you that seeds of wild mustard and yellow rocket do not come through a good silo in a viable condition. This is also true for mustard seeds in stacks of pea-vine silage. This information, obtained by experiments in the Botany Department, has been available for fifteen years. A short summary of these results was released in 1935 as a 'Farm Radio Brief' from the Cornell Station. The original experiments were set up in response to requests for information on this point by farm bureau agents and farmers."

I owe Professor Muenscher an apology for not having known more about the good work he had done on weeds and particularly for not having gone directly to him when I tried to find out whether or not the seeds of wild mustard and yellow rocket will grow after being in silage for a period of time.

My apology should be doubly profuse because I made the same mistake sometime ago and was picked up, as I remember it, by one of Professor Muenscher's students.

If Professor Muenscher will accept my apology, perhaps some good can still come out of the whole situation, namely, a lot of you folks will learn for the first time that mustard and yellow rocket seeds are killed in silage and therefore that grass silage is one of a number of practical means of fighting the spread of these two weeds.

FROZEN PIGS

For a number of years we have been taking in around six hundred dollars twice a year from a bunch of pigs we pasture down in the woods where no one ever sees them.

This spring, despite the fact that we topped the market for two-hundred-and-twenty-pound shoats on the day

Down Mexico Way

By H. E. Babcock, Jr.

(Above) Bonny and Belle have just presented us with the last two of our five mule colts. In addition to planting half of our 235 acres of cotton and 75 acres of wheatland maize, they have worked as part of the three four-horse teams which have cultivated the cotton land twice. By the time the cotton is ready for its third cultivation these two mares will be ready to go back to work.

(Left) Jurl Marshall is our boss teamster, responsible for keeping twelve to eighteen horses in shape to go in the field at any time. He is somewhat handicapped by the occasional birth of a colt, but with three geldings in addition to seventeen mares he has not failed to keep our horses at a par of eighteen ready for work each day.

(Below) Red, first of this year's crop of mule colts, which at the present time numbers five. At pasture we have seven mule colts and a horse colt. The mule colts were weaned during the winter and at local prices, regardless of size or condition, would bring us sixty-five dollars apiece, if we cared to sell them.

they were sold (at six dollars and thirty cents per hundredweight), our spring pig check was only two-thirds as large as usual.

There were a few smaller shoats that we did not sell. Two of these we killed about the first of June. In a period of three days these pigs, all divided up into cuts ready to roast or fry and properly wrapped, were frozen solid, including the sausage, in our farm quick-freezing and cold storage box.

The boys on the farm think that there is a lot worse food in the world than roast pork and gravy, especially in haying time.

Meanwhile, we have our first strawberries today (June 10) and will begin to freeze up what we can't eat of these so that we can have fresh strawberry shortcake whenever we want it next winter.

A plentiful supply of rhubarb and asparagus has already been frozen this spring, and there are still a dozen turkeys left in the box from the lot we froze last fall, and the last few pieces of half a steer.

Protective SERVICE BUREAU

MEMBER
AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Conducted by H. L. COSLINE

She Didn't Bite

On May 14 a man with a new car, license 734-360 (Texas), loaded with fur coats, called at my door and said he would sell me a fur coat dirt cheap as he was on his way to Canada and didn't want to take them over. He didn't sell me a coat because I had read in *American Agriculturist* about a similar case. We wouldn't be without your splendid paper. You can print this letter as it may save someone else from a so-called bargain.—Mrs. P. L., New York.

EDITOR'S NOTE: A later letter from this subscriber states that after the above letter had been posted, she decided to telephone the State Police. A Trooper found the fur dealer, inspected the furs, and decided that the coats were made of rabbit skin and that the price at which they were being offered was far in excess of their value. Of course there is no law against charging all you can get for anything you have to sell, and the usual procedure in such cases is to advise such an agent that he would be very wise to leave the neighborhood without attempting to sell any more rabbit skin coats.

A Dollar a Week

A company in Philadelphia has a unique way of catching suckers. A man calls on you, explaining that you pay one dollar a week for a certain number of weeks and then a drawing takes place. If you are the lucky chap, you get your suit of clothes for half price. If you do not win, then after you have paid in the full amount, they send a man around with samples, he measures you, and your suit is sent on to you.

BUT, here is the joker—after you have paid in a certain amount, they notify you that you MUST go to Philadelphia to get your suit and pay the balance due on it. The man collecting does not come around any more. You are left holding the bag. I am a sucker to the extent of \$22.00. There are quite a few others with me.

I am writing this so you can print it if you wish. I feel that, with summer coming on, they will try this game in other places.—G. R. B., New Jersey.

Hay Trouble

"A man representing a dealer in hay bought a car-load from me. He was here three times and looked at the hay in the barn. He was also at the car when the hay was loaded and inspected each bale as it was placed. I was given a draft in payment and I put it in the bank. The next day it was returned as payment had been stopped. Later I received a letter from the dealer finding a lot of fault with

the hay and said that he would make some payment on it. The hay was all right when it went into the car and I have sold some from the same mow for \$12.00 per ton."

Until we get more evidence, it cannot be said with certainty that this is a deliberate attempt to chisel on an agreed price. We can however, say this, that complaints of this nature occur so frequently and regularly that our suspicions have been aroused. It is a misdemeanor to give a check without money in the bank but it is not a misdemeanor to stop payment, find fault with the quality and finally settle for a price much lower than that agreed upon. Where a buyer's agent has every opportunity to inspect the hay we can see no justification for finding fault with it after it is loaded on the car.

Found Guilty

We recently told you about the trial at Syracuse, New York, of the officers and salesmen of the Traffic Inspectors Training School, on a charge of using the mail to defraud. Mr. Robert J. Leamy, Assistant U. S. Attorney, writes that this corporation and five of its officers and salesmen were found guilty by the jury. The corporation was fined \$2500. The president, Charles Van Buren, was sentenced to serve two years and eight months in the Lewisburg Penitentiary. Other officers and salesmen convicted were given terms ranging from six months to two years and four months.

"Quack, Quack"

"Recently a man called upon a friend of mine who is ill with Arthritis. He claimed he had a wonderful medicine that would cure anything. He explained that all sickness came from acid in the blood and that his dope would drive it out. He wanted \$20.00 for four or five packages of the stuff. I tried to discourage her but she was much impressed by his fine words. Your Service Bureau has saved me from making some foolish mistakes."

You did exactly right. Reputable doctors are not driving the roads drumming up trade. Furthermore his claim that he had a medicine that would "cure anything" is too ridiculous to consider for a minute.

She Broke the Chain

Some years ago when I was residing in New York City, a friend of mine inveigled me into buying a coupon from her for the price of \$1.00. I was then a member of this chain business. It happened to be a Turkish bath towel concern, located in Paterson, New Jersey. In order to get these six wonderful large bath towels, I would have to send an additional \$3.00 to the company. They would then send me three more coupons to sell to some of my friends. They in turn would have to sell three coupons before I would receive my towels. My friends, however, were not as gullible as I was, and consequently I was left holding the bag, so to speak.

I wrote the company and explained to them that I was unable to dispose of my three coupons, and would they be kind enough to send me a couple of towels at least. I did not ask for my money back. They wrote me that it would be impossible for them to send me any towels as it would break this endless chain, etc. I lost no time in reporting them to the postal authorities in New York, and I am confident that they were put out of business for using the mails to defraud people for I never heard any more about this firm nor any other chain business.

Needless to say, my family ribbed me plenty for being so gullible. This may serve to help some of your readers who might be faced with a similar experience.—Mrs. A. H., Maine.

TWO POLICYHOLDERS RAN INTO EACH OTHER

This is one of the wrecked cars.

EACH DRIVER was badly hurt. Fortunately each carried our travel accident insurance policy and each received \$130.00 in weekly benefits. You never know when you are going to need the protection of a travel accident insurance policy.

Mr. Hollis McPherson
Holcomb, N. Y.,
writes:

"With appreciation and gratitude we want to thank you and Mr. Reed, your agent, for his kindness and your promptness in paying my claim for \$130.00.

"In the accident I received a fractured hip and a dislocated lower jaw, so this payment is very acceptable.

"It helps pay the extra bills. Five members of our family carry this insurance."

Mr. Norman Richardson
Clifton Springs, N. Y.,
writes:

"Have received your check for \$130.00 payment on account of the automobile accident which occurred in the town of Canandaigua.

"My injuries were, compound fracture of the left leg and fractured collarbone.

"This payment I appreciate very much and I will always say a good word for this insurance policy which I believe is the best."

Keep Your Policy Renewed

We suggest that you choose the new policy costing \$2.00 a year which provides added protection particularly on pedestrian accidents. \$1,000.00 is paid for the loss of life or \$10.00 a week for as many as thirteen weeks for total disability on the accidents covered by this policy.

Husky Pullets

The chief benefits pullets get from this kind of range are sunshine, fresh air, and exercise. They are healthy and well grown because they have had plenty of Starting & Growing Mash, plus grain, grit, and water. Pullets need these things on range just as much as they do indoors, although a really green, leafy range will reduce feed consumption somewhat. With egg prices low, it's hard to spend money on rearing pullets. But wherever prices may go, a well-grown pullet will be better property next fall and winter than an undersized, poorly developed bird.

Grass Silage

The fact that not much hay was carried over from last winter makes it doubly important to get full value out of this year's great grass crop. Grass silage will help, particularly when the weather is not right for haying, by enabling you to get the first crop off in time to give the second cutting a good start. Ensiling a weedy crop will prevent the weeds from going to seed, and few weed seeds will survive the process. Silage can be made from any crop that is used for hay by adding Silo-Phos or molasses. G.L.F. Service Agencies will supply either one, and tell you how much to use.

All dairy feed ingredients except corn and molasses have decreased in price in the past ten months. G.L.F. dairy feed formulas—excepting the super feeds—have been adjusted to use more of the lower-priced ingredients and less of the costlier products.

The formula changes, which went into effect June 12, involve increased use of corn distillers' dried grains and linseed meal, reduction of ground soybeans, and putting oat feed (which has dropped \$5.00 a ton) back into the 18% and 24% Cow Feeds.

Total digestible nutrients (T.D.N.) remain the same in 20% Exchange Dairy and are slightly higher in 24% Milk Maker, 18% Legume Dairy, and 20% Cow Feed. Feeding value of 18% Cow Feed and 24% Cow Feed is reduced, but these feeds remain comparatively economical on a basis of cost per 100 lbs. T.D.N.

To Ithaca this week, as they do each June, came the G.L.F. district men, to get ready for the Patrons' Annual Meetings which will be held in nearly 600 communities this summer. Through these meetings, users of G.L.F. keep control of their cooperative in their own hands by choosing committeemen who represent them in the election of G.L.F. directors. Few evenings this sum-

mer will be better spent than the one you spend at your Patrons' Annual Meeting.

Each year G.L.F. provides a 20% summer feed for those who prefer to use a feed containing no molasses during the summer. SUMMER DAIRY is now available. The formula:

460 lbs.	Corn Gluten Feed
100 "	41% Soybean Oil Meal
200 "	34% O. P. Linseed Meal
260 "	Wheat Bran
440 "	Hominy Feed & Corn Meal
100 "	Oat Mill Feed
400 "	Corn Distillers' Dried Grains
15 "	Dicalcium Phosphate
5 "	Ground Limestone
20 "	Salt
2000 "	SUMMER DAIRY
1524 "	Total Digestible Nutrients
Protein—minimum—20.00%	
Fat—minimum—4.00%	
Fiber—maximum—10.00%	
Digestible Protein — 17.90%	

7,840,618 feed bags were returned in good condition to G.L.F. mills during the 10 months ending May 31. Total payments to senders of used bags: \$650,000. Six out of every 10 bags now being used for G.L.F. feeds are bags that have already made one or more trips to the farm.

COOPERATIVE G.L.F. EXCHANGE, INC. . . ITHACA, N.Y.

Cultivating

The home garden needs frequent, shallow cultivating to get the weeds without injuring the roots of the crop. Tools like the Unico cultivator shown here do the job a lot faster than a hoe. Thinning the plants (below) so they have plenty of room to grow is another worthwhile chore.

A True Story of the Development of Dairy Produce in New York State

BY ROBERT GARD

COLONEL MEACHAM was a man of imagination. No one who knew him in 1834, when he lived on his farm near Oswego, New York, doubted it. Always his active mind was playing with the idea of an invention or a scheme of promotion. He was a respected citizen; indeed, his neighbors considered him a bit grandiose and regarded him as perhaps the master showman of the countryside.

Colonel Meacham was a firm believer in the value of dairy products, and in accord with his belief he developed a large herd of milk cows. Just what breed these cows were, I do not know, but I do know that there were a hundred and fifty of them and that they were all giving some milk in 1836. This was a considerable herd of milk cows in those days, especially when it wasn't easy to dispose of milk. People made lots of cheese, but New York cheese wasn't especially well known, and the markets were apt to favor New England and Pennsylvania cheese to that manufactured in the upper reaches of New York.

It was a real problem—this business of disposal—and Colonel Meacham decided one day that he was the man to solve it. He let his

vivid imagination dwell on the matter, and as a result his neighbors were amazed to see a great cheese-hoop in the process of construction in the Colonel's barn—a hoop fifteen feet in diameter and over seven feet high. Then everybody began saying that the Colonel was crazy and was really getting too grandiose for Oswego, but the Colonel knew what he was about and bore all the jests in silence.

He saved the milk of his hundred and fifty cows for seven days and filled that cheese-hoop to the brim with curds—and the cheese was on its famous way.

In the days necessary for the cheese to harden and become a cheese, the Colonel carried about with him a mysterious and irking air which led to all sorts of conjecture in the countryside. Some said that he was making the cheese to tempt the numerous rats so they would let the corn alone. Others hinted that the Colonel had let his imagination run away

Cheese for Snowballs on ANDY JACKSON'S LAWN

The big cheese which attracts so much attention at the New York State Fair always makes one wonder if northern New York dairymen did not miss a bet when they stopped making cheese to take on all of the troubles of shipping fluid milk. See editorial.

with him and had become a little queer. Still others said that he was going to exhibit the cheese in the town square at Oswego—but no one knew what was really in the Colonel's mind.

When at length that cheese was hard and had become a cheese, the Colonel went about the countryside asking all the people who had grey horses to come and bring them to his house on a certain day in the fall. People were very much perplexed, but they left off their fall plowing and brought their grey horses. They didn't know whether it was to be a horse show or a pulling contest or queer kind of bee, but they came out of natural curiosity. A few hinted that it had some- (Turn to Page 9)

Your Questions Answered

Herd Classification

What is meant by the term "herd classification"?

HERD CLASSIFICATION is an attempt to group dairy animals by type. It is officially recognized by the Holstein-Friesian Association and the American Jersey Cattle Club when the classification is done by a breed representative; but other breeds are also classified, usually by a committee appointed by the county breed association.

To be classified, the herd must have been enrolled in the Dairy Herd Improvement Association for several years. The classification committee visits the dairy farm and divides the animals into six groups—poor, fair, good, good plus, very good, and excellent.

A "poor" animal is one judged by the committee to be unworthy to represent the breed. When a cow is classified as "fair", the Holstein and Jersey Clubs will not register the bull calves. The "good" group has been called the "great mediocre majority" so far as type is concerned; while the "good plus" group makes up that group which is just above the average.

The group designated as "very good" includes animals that you will find taking prizes at county fairs and frequently bringing top prices at cattle sales. An animal in the "excellent" group will usually land near the top of her class when shown at state fairs. Frequently a high producing herd may be classified with only one animal, and sometimes none, designated as "excellent."

This classification has no relation to production. The best producing cow in the herd may be classified as "good" or "good plus" but when averages on a large number of animals that have been classified are summarized, there is a direct relationship between classification and production. On the average, the animals in the higher classifications have the best production.

Frequently a cow that produces heavily, but is poor in type, does not have the vigor and stamina for a long

productive life. The animal showing good type for the breed is the one that stays in the herd until she is 10 or 11 years old. Remembering this, the herd classification committee are usually rather severe in classifying younger animals and just a bit lenient in classifying older cows. However, younger animals can be reclassified, and if they stand up, they are often moved up into the next class.

A dairyman who has production records on his herd and whose herd has been classified, has the information needed for a breeding program to improve his herd, both as to type and production.

Raises Grain for Hens

Cleaning a laying house on the farm of Francis Townsend, Cazenovia, N. Y. When fields are available, manure is loaded into a spreader and taken di-

rectly to the fields. For his flock of between 2,000 and 3,000 laying hens, Mr. Townsend grows considerable grain. He says:

"I doubt if it would be profitable to

RAISING GOOD CALVES

MAX FREY of Chittenango, N. Y., says that no calf under a year old will do well on pasture. Here is his program:

He gives them milk for six weeks, and is strongly of the opinion that calves should not be fed pasteurized milk.

Then gradually they are changed over to a dry calf starter. They get some starter until they are 7 months old, but gradually they are changed over from the starter to a home-grown grain mixture of oats, corn, and barley, to which soybean meal and steamed bone meal are added.

Just as soon as they will eat it, they are fed all of the good roughage they will consume; and when Mr. Frey says good roughage, he means exactly that. Calves get the best hay on the place.

Calves less than a year old are not confined to the barn. They are let out on pasture, but they are put there for sunlight and exercise and not with the idea that they are going to live off the pasture.

Mr. Frey raises his own replacements for two reasons. First, with a herd average of 472.3 lbs. of butterfat

and 13, 670 lbs. of milk he believes that he can raise better replacements than he can buy. In the second place, he has a Bang Abortion free herd. His first certificate goes back to 1932, and his was the 62nd herd in the state to clean up the disease under the Federal-State Plan.

grow grain to sell, but so long as grain prices are pegged by government action, I can grow grain to feed on the farm and make money at it. I have the land and I have the manure. I usually have 20 acres of wheat, 5 acres of spring grain, and 5 acres of husking corn. The corn is fed whole, beginning when the chickens are four weeks old."

Mr. Townsend's program for rearing pullets has an unusual angle. He has four ranges which are used in rotation, but these are never plowed or cultivated. When not used for pullet ranges, they are pastured.

The eggs from this farm are graded closely and shipped to New York City, where they are sold at a premium above the market.

Good Results from Calf Vaccination

M. G. Adams of Oneida, N. Y., has been vaccinating calves against Bang Abortion for the past 4 years in conjunction with a private blood test. Emphasis should always be given to two facts. First, mature cows should not be vaccinated; and, second, no animals should be vaccinated until a blood test shows just what the situation is.

"I decided to vaccinate," says Mr. Adams, "primarily because I retail milk and, from my herd of 80 Holsteins, it is important to produce a

M. G. ADAMS

uniform supply of milk the year around."

Previous to vaccinating, Mr. Adams had had some trouble with abortion, which in one year caused 15 cows to lose their calves. Last year there was one abortion in the herd, and there has been none so far in 1940. Incidentally the one that aborted last year was the first cow to abort on the farm, that was vaccinated as a calf. Another interesting fact is that in private blood tests only one animal that was vaccinated as a calf has failed to clean up and give a negative reaction to the blood test. That, we might add, is a better record than most experiments have shown. It is generally admitted that one out of five heifers vaccinated as calves will not clear up and give a negative test.

Three years ago Mr. Adams had 18 mature cows that had never been vaccinated but which gave a positive reaction to a blood test. Nine of these have been sold, and there are still nine in the herd.

BOMBING WOODCHUCKS

COUNTY Agent Field of Onondaga County, N. Y., demonstrates the use of "bombs" to control woodchucks. Three or four small holes are punched

in the top of the bomb. Then the fuse is lighted, the bomb is dropped in the hole, and the opening covered with sod. Dense clouds of poison smoke are given

off. If the fumes come out of other nearby holes, those are also plugged.

These bombs are supplied by the U. S. Bureau of Biological Survey, and most county agents have had a few this spring. The Bureau is still working to improve their effectiveness.

There are two other methods of killing woodchucks. One is to back up the car or truck, put a hose on the exhaust pipe, and run it down the hole. When the engine is running, carbon monoxide is given off. The second method is to use Cyanogas. This material can be put back in the hole on damp earth, whereupon it gives off poison gas; or it can be blown into the hole by means of a dust gun.

How We Keep Our POULTRY *Disease-Free*

The Rice Boys Tell How They Handle This Important Detail

SANITATION is a much over-worked word, meaning one thing to one farmer and something totally different to another. To the three Rice brothers—Paul, James, Jr., and John—it means a definite program designed to keep all poultry buildings and surroundings in as nearly a disease-free condition as practical difficulties make possible. Because they operate a big business, some points of their program may not be adaptable to all farms, but from their experience we believe every poultryman can gain some suggestions.

Let's start right at the beginning with the hatching operation. On the 18th day of incubation the incubators on the Rice farm are fumigated with a standard treatment of formaldehyde and potassium permanganate. One pint of formaldehyde and one-half pound of potassium permanganate are used for each 1,000 cubic feet of air space. If you are interested, drop *American Agriculturist* a line, and we will give you complete directions. Then, between hatchings, all incubator trays are thoroughly scrubbed in a 3% solution of a coal tar disinfectant.

Every brooder house gets a thorough going-over before chicks are put in. The first operation is to scrub with

By H. L. COSLINE

RIGHT: James Rice, Jr., scrubbing the brooder house floor with hot water and lye.

BELOW: Instead of using dropping boards, there is a wire-covered pit under each roost.

are put on wire screens to prevent muddy spots, and the houses are moved each week or two to get away from bare spots of ground and the concentration of droppings which occur in front of each house.

No poultry manure is ever spread on any of these four ranges. Fertility is maintained by the droppings of the young stock and by the fertilizer which is added to the crops grown in rotation. Visitors are allowed to drive over the range, but are requested not to get

ABOVE: Range shelters and brooder houses are moved frequently to avoid the development of bare spots and a concentration of droppings.

RIGHT: An outdoor tank provides a handy place to disinfect drinking fountains.

warm water and lye. This lye is not used so much as a disinfectant as it is as an aid in loosening droppings on the floor. Into a 16-quart pail of hot water is poured about 1" of lye from an ordinary one-pound can. Ceilings and sides are brushed with a broom. After the house is clean right down to the wood, it is sprayed with a 3% coal tar disinfectant. Then the floors and walls to the height of about 1 foot are painted with carbolineum which has been thinned with 10% of kerosene. The roosts are also painted, and if there has been any sign of mites, the cracks between the boards in the wall also get a going-over.

Drinking fountains for the chicks are scrubbed in a coal tar disinfectant and then rinsed. After the chicks are put in the house, the fountains are rinsed every day and scrubbed and disinfected once a week. On this farm about four lots of chicks go through each brooder house every year, and every time a bunch of chicks is moved out, the feeders are also taken out and disinfected.

The brooder houses are cleaned out every seven days as clean as they can be swept. The boys find that the use of carbolineum on the floor makes it easier to sweep and clean. There is a definite reason for this periodical cleaning. The life cycle of the organism which causes chronic coccidiosis is eleven days. If there are any of these organisms present, a cleaning every seven days tends to break up the life cycle and keep the infection at a minimum.

Every brooder house has a wire porch in front which tends to lessen the concentration of droppings in the house. Jimmie says that if he were running a sideline poultry enterprise on a general farm, he would get the chicks out on the ground at the earliest possible moment even if he had to scrape the snow off the ground; but in a specialized business where a lot of

chicks are handled, he feels that the wire porch is a definite sanitary measure.

"Also," said Jimmie, "we probably ventilate our brooder houses somewhat more than the average poultryman. It helps to keep the houses dry, and we feel the chickens do a little better. If there is any outbreak of coccidiosis in any of our flocks, we put them on a wire floor while they are getting a milk flush."

The next milestone in the lives of these chicks is when they are moved out on range. On the Rice Egg and Apple Farm four ranges for young stock are maintained in regular rotation, and each range has a three-year crop rotation while the pullets are on other ranges. The drinking fountains

out of the car and walk on any part of the range.

Before pullets are put in laying houses in the fall, there is a week of housecleaning that would get the approval of the fussiest housewife. The general program is similar to the one already described for cleaning and disinfecting the brooder houses.

"Every pullet," say the Rice boys, "has a right to start housekeeping in clean, sanitary quarters."

With old hens this housecleaning is considered less essential. Besides there are some practical difficulties

(Continued on Page 17)

If each before his own door sweep
The village would be clean.

—Old Country Saying.

Milk Investigations Reduce Consumption

IN AN effort to reduce retail price of milk to consumers, and increase consumption, many different plans are being tried by distributors in various milk markets. Included in these new methods of handling milk are several new kinds of containers such as paper bottles, gallon bottles, 2 quart bottles, etc.

The difficulty, however, is more fundamental than the container. It goes back mostly to the labor situation. The man who delivers the milk usually gets far more pay for his work than the farmer gets for work, capital, and management. In fairness it should be said that it costs a lot to maintain a home and raise a family in the city, so maybe the problem goes back to a larger load handled by each workman, or to cutting all deliveries out and making the consumer go to the store. The trouble with that is that the consumer won't go.

Therefore, if the consumer insists on service, he ought to be willing to pay for it, and he would be if the politicians would leave him alone. I have always said that a too low price to the consumer means a starvation price to the farmer. Even though there may be inefficiencies and too high profits at times in the milk business, milk prices are not high compared to prices of most other foods, the politicians and demagogues to the contrary, and about the worst thing that can happen to both consumers and producers are milk investigations, and yapping by cheap politicians about the high price of milk. Let them yap about something else. The result of most milk investigations, and I have seen plenty of them, is that the consumer gets the impression that he is being robbed when he buys milk, so he gets along with just as little as possible or uses substitutes.

It is interesting, but also disheartening, to note that many of these milk investigations start in election years. Investigations based on a sincere desire to bring out facts and to show up evils are good, but there have been few such investigations in the milk business. Most of them have been started to elevate some demagog to higher office, to hunt for evidence to support conclusions already reached, and to make sensational reading in newspapers.

Too Much Water in Grass?

THE WEATHER is a good subject to stay off from with farmers in most sections of the Northeast this spring. It rains just as much this year as it didn't last. It's provoking and worrying to have a lot of work planned ahead and be unable to do it because of so much rain.

There's an offset, however, and that is the best pasture and hay we have seen in many a year. It is indeed pleasant to ride across our great dairy country and to see cows actually up to their knees in pasture, or more frequently lying down contentedly chewing the cud because they have been able to fill up in a short time.

If the rain doesn't let up soon, however, it is going to be a job to get the good hay into the barn. That's where putting grass in the silo comes in, for you can still make hay where there is no sun.

I have been interested in hearing several of my dairymen friends complain that the quality of grass is poor this year. The cows eat a lot of it and don't produce as they should. I wonder if

there is anything in the theory that there is so much water in the grass that it is not up to standard in nutrients? What do you think? What has been your experience?

Why Clover Fails

WHY IS it so difficult to get or maintain a seeding of clover? Nine times out of ten you would tell me that it is because the clover heaves out. That is true in some cases, particularly on heavy, wet land; but H. H. Whetzel, Professor of Plant Pathology at the New York State College of Agriculture, says that blaming all clover and legume failures on heaving is mostly the bunk, that the real trouble, after you have once secured a good stand, is disease and insect pests.

Of course, the first problem is to get a stand by using high quality adapted seed, liming, and doing the other things to put the soil in condition.

I saw proof of the havoc wrought by disease and insect pests the other morning on the U. S. Department of Agriculture grass plot tests near Ithaca, where splendid stands of both red clover and birdsfoot trefoil were failing because of a fungus disease known as sclerotinia crown rot. Time after time we lifted up the matted stems

This picture of "bending shelves with loaves of cheeses pressed" will recall to many of the older dairymen the days when New York was one of the greatest cheese-producing sections in the world. Mr. Fred J. Hayes of Potsdam, New York, reminds me that cheese is one of the oldest and best liked of human foods. To prove it, Mr. Hayes refers me to Job X:10:

"Hast thou not poured me as milk and curdled me as cheese."

"Carry those 10 cheeses to the captain of their thousands and look how thy brethren fare."

Homer, the great Greek poet, says Mr. Hayes, wrote about cheese as follows 907 years before Christ:

"Around the grot we gaze, and all we view,
In order ranged our admiration drew,
The bended shelves with loaves of cheeses pressed,
The folded flocks, each separate from the rest."

on the red clover plots and in the birdsfoot trefoil plots, only to find a slimy mess underneath where the crown rot was operating on the stems of the legumes.

This disease is worse in wet seasons like this. It is to be found practically everywhere in the Northeast, and it also attacks alfalfa and both red and yellow varieties of sweet clover.

It is too bad that birdsfoot trefoil is also susceptible, because many of us have hopes that this wonderful legume will be grown on most northeastern farms. Fortunately, birdsfoot trefoil tends to reseed itself and is likely to produce seed before the old plant is destroyed by the crown rot.

Another bad enemy of legumes is the clover root borer, the larva of a small beetle that bores into and destroys many of the legumes which have large roots.

The only known remedy for crown rot is to develop varieties that are resistant. Already the research scientists are hard at work on this job. Mr. Thomas Sproston, Professor Whetzel's assistant, has recently completed tests on 10,000 varieties of clover seedlings and found eight that seemed to be resistant to crown rot disease.

Farmers to Get Long Distance Weather Reports

THE United States Weather Bureau announces that it will soon start to forecast long distance weather conditions for at least a week ahead.

I confess to some prejudice about official weather forecasting, for it often seems that any old-timer who has lived in the same place for years can tell more about the weather for the next day or two than a scientist can, and that he can do this even though he hasn't got the "rheumatiz."

There are certain weather signs that one learns to recognize after living a long time on the same farm that are fairly reliable, although all of them fail when the weather gets to running in streaks, like in a long rainy spell or a long dry one.

However, the scientists can prove that their forecasts are at least 80 per cent right, and that's about as near right as anybody ever comes on anything anyway. So we freely admit that the Weather Bureau is of help to agriculture and to anyone else as dependent upon weather as is the farmer. If the farmer can be reasonably sure of the weather for a week ahead from his Weather Bureau reports, it will mean great savings to agriculture. It will be interesting to watch these long distance reports when they come and to check them with the weather to see how accurate they are.

Eastman's Chestnut

AT THIS time when almost every day brings news or rumors of another nation entering the World War, I am beginning to wonder what it is going to be like when they all get at it. The situation reminds me of the story of an old Kentucky woman who was on the witness stand to tell what she knew about a fight in her house where three or four people had been killed.

"Well, Judge," she said, "The fust I knowed about it was when Bill Sanders called Tom Smith a liar, an' Tom knocked him down with a piece o' stove-wood. One o' Bill's friends then hit Tom with a knife, slicin' a big piece out o' him. Sam Jones who is a friend o' Tom's, then shot the other fellow, an' two other fellows then shot Sam, an' three or four other fellows got cut right smart by somebody. That nat'rally caused excitement, Judge, an' then they commenced a-fightin'."

Keep Quiet and Saw Wood

WHEN Germany marched into Belgium and the Netherlands, Americans were so sympathetic that sentiment for the moment in this country was very warlike. But as events developed, it became evident to all thinking persons that it was too late for us to be of any real help to the Allies; and there has been a rapid change in sentiment again back to the necessity of staying out of this war. In spite of this determined and emphatic feeling of a majority of thinking American citizens against participation in the war at this time, our government is talking us into it.

What has happened to France and England is one of the most tragic examples in all history of talking too much without having anything to back up the big talk. It ought to be plain by this time that the situation against the Allies has moved too fast for America to be of much practical help to them, even had our people been ready to plunge into the War. Our job is to build our defenses as rapidly as possible, and particularly as efficiently as possible, without wasting money; and above all, to keep our mouths shut. With strong defenses, there probably will be no need of war. Indulging, as our government officials have recently, in so much loud belligerent talk helps nobody, and will plunge us into a war before we are ready and at a time when we are as unprepared as England and France have proved themselves to be.

The Present Crisis and You

"Europe has become a worried and uncomfortable place to live in. Nightfall comes and scarcely a light is visible over entire western Europe. To eat, one must have ration cards and even such staples as coffee, eggs and butter have either disappeared or been curtailed in the average man's diet . . . Last winter was the hardest and coldest Europe has had in years. Spring planting was unusually late, and what with a large percentage of peasants and farmers fighting in the western front the area was unusually small.

"The U. S. Department of Agriculture predicts that this summer's European harvest will be the lowest in years at a time when the consumption will be the greatest in more than 20 years. The crowded continent, never self-sufficient in food, faces next winter with every prospect of a famine."

—From "PM," a new New York City newspaper.

ON THIS side of the water, surveys show that we have no large surpluses of food on hand. Because of this fact, American farm leaders are giving serious thought to plans for meeting the great emergency. Every farmer will be affected and should also give thought to how his own business may fit into the situation. It is too late to do much about increasing the crop this year. This may be a good thing, considering the ruinous effects upon American agriculture during the past ten years of American farmers' response to the first World War slogan, "Food Will Win the War." They speeded up agricultural production so fast and so much that they could not halt when the demand did, and we were ruined by our own surpluses. Whatever happens, let's not do that again.

Another danger is more regimentation. That will be the first thing the bureaucrats will want. They claim, like the dictators of Europe, that in order to meet emergencies, it is necessary for them to have more and more power. That is not so. Executives of this country have plenty of power now to meet any emergency if they themselves plan and work efficiently and in such a way as to secure the cooperation of American farmers and other citizens. I have heard some of my friends say recently that they are willing to be regimented if we make sure we can get our freedom back after the emergency is over. I for one am not willing to be regimented, nor to see American agriculture regimented, for I know all too well that we seldom ever get any power back from a bureaucrat after he once gets it. Let's not lose our liberty because some government official thinks he has got to have more power in order to save our liberty.

There are some things that every farmer can

do to help. He can take better care of the crops which already are in the ground, he can look to his other enterprises like livestock, dairying and poultry to increase production by efficient methods. Above all, every farmer, with every other citizen, can help in the present crisis by not letting somebody stampede him with too much emotion, and by using the good commonsense God gave him and expected him to use.

Another Women's Cooperative

IN THE May 11 issue of *American Agriculturist* we carried a front page article about a group of women in Montgomery County, Maryland, who got together and built a successful cooperative to sell the products of their farms, homes, and gardens. Much of the information for this interesting story came from an excellent article written by Otis T. Weaver, Agricultural Economist, Cooperative Division, Farm Credit Administration.

We suggested at the time that here was something women might possibly do in other communities to add to their income. Well, they are at it already. I don't know whether our article had anything to do with it; that doesn't matter—but I do know that the women of Pleasantville, New Jersey, have organized another women's market to sell strawberries, vegetables, home-baked stuff, etc. Starting on a small scale, the market will be open only one day a week. To finance the market, the women contribute an entrance fee and a small commission is charged on the produce handled.

This idea has possibilities.

A True Story From Life

I HAVE a friend who is the mother of a large family. Interested in music myself, I asked her recently if her sons and daughters were musical.

"My word, yes", said she, "the whole family, including Dad and myself, play in our family orchestra."

Then she told me that the family recently needed three new musical instruments. They were expensive, and the family funds were not

too abundant. So father and mother sadly concluded, after a secret conference, that they were unable to purchase the instruments at that time.

But mother got to thinking it over. She had saved a little money for a new coat, so she said to herself:

"Music is more important to the children than the coat is to me."

The next day she purchased the instruments and sent them home. Later she arrived, to be met by an enthusiastic bunch of youngsters who began telling her about the wonderful new musical instruments that Daddy had bought.

"Well", said she, somewhat stunned, "you mean Daddy and I bought them together."

"No", said one of the boys, "Daddy bought them!"

Lo and behold, Daddy had! Both father and mother had had the same self-sacrificing idea.

I think that little story illustrates again why the family and the home are the safeguard and foundation of society. In our willingness to work and to sacrifice for those we love, we help them and ourselves to broaden our lives and our love to include all humanity.

"I Am Not Afraid"

IN LINE with the determination of the American people to give every boy and girl an education, our institutions have just graduated another army of young people who are going forth into the Battle of Life. Never in the history of the world have the times been more fateful or more difficult for young people than they are now, but this grave crisis may spell opportunity for the coming generation. Certainly, no matter how grave the problem, the rapid changes will be interesting.

The most cheerful, hopeful thing that I have heard in a long time was a remark made by a young man to me recently when I said something about the present crisis. He looked me straight in the eye and said: "I am not afraid."

I don't believe his generation is afraid, and I thank God for that, for with the education which they possess and the courage which is every young person's heritage, the young people will solve most of their problems and make a better world in which to live.

Readers Talk Back

VERMONT HAS BACKBONE

"In his write-up of a Vermont Town Meeting in a recent issue, Jared Van Wagenen speaks of the Liberty Hyde Bailey farm. My father, Franklin Palmer, bought this farm and came here to live 25 years ago this May. Mr. Van Wagenen wrote as though Vermont had plenty of good backbone people in it yet. We were much interested in his article, and especially in the mention made of our home, which is very dear to us."—Mrs. J. K., Vt.

"Fifth columns" would not last long in Vermont!

* * *

ROCKET A PEST IN MAINE

"Your article on yellow rocket (winter cress) which appeared in the June 22 issue will interest your many readers, particularly those in Aroostook County. This weed has been of great concern to us in Aroostook and the Extension Service has endeavored to drive home the danger of this weed through radio, press and meetings."—Verne C. Beverly, County Agent.

* * *

HOW TO STOP DAYLIGHT SAVING

"You say farmers can do something about it if they are mad enough. Well, I am that mad, and I am ready to enlist in any campaign to get rid of this nonsense. Please tell us how."—M.B.G., N. Y.

It is too late of course to do anything about Daylight Saving this year, but early in the fall we should start in with every farm meeting, Grange, Farm Bureau, and there might even be some special meetings, have the subject thoroughly discussed, resolutions adopted, a committee appointed to visit local business men and local officials. That committee should tell the people in town courteously but none the less emphatically that farmers are not going to stand for Daylight Saving in the small

towns and cities. If enough of you are mad enough really to cooperate, you can stop fool time in and near farm communities. Probably your friends in the nearby town don't even know how emphatically you are opposed to new time.

* * *

FROM ONE READER TO THE OTHERS

"I would like to say this to your readers: All of us who take A. A. like it or we would not subscribe good money to get it. I think most of you agree with me that it serves a purpose few other agricultural periodicals attempt, namely, to promote the interests of agriculture, whether it makes the paper profitable and popular or not.

"With its present policy of sticking to the truth and striving for better things, A. A. will never get the following it might if it catered to the malcontents and reactionaries. It must depend on loyal friends who are also striving to make the Northeast a better place to live and farm.

"Periodicals, as we all know, are supported by the advertisers, not the subscribers; and for that reason, every loyal reader of A. A. should go to some pains to mention A. A. as the source of the 'lead' whenever they are answering an advertisement. It is a little thing for us to do in return for all that A. A. does for us."—E. W. M., N. Y.

Letters like that, and we get a lot of them, warm the editors' hearts and make us feel like jumping in and working night and day to do a better job for our folks. I'd like to say again that no individual owns a cent of *American Agriculturist*. The publication is owned by a Foundation, which represents its readers. All the profits are used for just two purposes: First, to build a bigger and better paper, and second, to help worthy farm boys and girls complete their college education. Anything you do, therefore, to help *American Agriculturist* is really helping farm folks of the Northeast.

USE ESSO FUELS AND LUBRICANTS ON FARM MACHINERY

FARM MACHINERY is a big investment. Your problem is to keep it in good condition and run it at the lowest possible cost. And Esso products solve it!

Using Esso fuels and lubricants, tractors pull without overheating. Trucks haul the heaviest loads with ease and profitable speed. And the family car gives you a new kind of smooth, powerful performance.

There's an Esso lubricant to suit every farm need. And there are *two* new Esso gasolines... both the finest in their price class. Demand Esso products for *power* and *protection*. Both good reasons why it's best to buy at the Esso Sign.

ESSO MARKETERS

COLONIAL BEACON OIL COMPANY

New ESSO

Regular in Price, it actually meets premium specifications for anti-knock. A powerful favorite for trucks, tractors or the family car.

New ESSO EXTRA

The finest gasoline ever sold by the world's leading petroleum organization. Absolute tops for extra quick starts...extra fast pick-up...and extra quiet operation.

Garden Gossip

By PAUL WORK

THE NEGLECT of the home garden as a food supply on the farm is a pretty serious matter. In the course of the next five years, it may be far more serious. A good many people, even in the so-called highly civilized portions of the world, are likely to be exceedingly hungry this coming winter. So, it might be a pretty good idea for us to learn to make the most out of our home gardens, and one way to do this is to keep on planting until September 1.

The rows of peas are now cleared up or should be. The early plantings of radish, lettuce, spinach and perhaps early cabbage are gone. This space may well be used for later plantings of a good many things. Sweet corn may be planted in most of the state up to July 1—if an early variety is used. Beets may be sowed and even carrots. Later plantings may be made of spinach and snap bush beans.

It is not necessary to have a supply of all things at all times, but there ought not to be a day from June 15 until October 15 when anyone, except in the very coldest regions of the state, might not have all he can use of vegetables for the home table. Where the season is longer, this period is naturally considerably extended.

* * *

Season Catches Up!

We are all very free and glib about saying how late the season is or how early, how much rain we have had or how little. It is rather amazing, however, how frequently we get set back on our haunches. Then, when we analyze the situation a bit, we can usually understand some things.

Certainly, the season of 1940 started off exceedingly slowly, but in our student gardens at East Ithaca, we had 2 inch beets ready for market at the same time as during the previous three years. We ordinarily figure on getting 50 or 60 cents per dozen bunches (4 each) of these transplanted beets. This year, the price was way higher than that, but I would not want to count on it regularly.

For another illustration, a planting of peas came through just three days later than a year ago. Cabbage was cut in the student gardens the 15th of June—just eight weeks after it was set.

Now, what happened? Certainly April and the first week of May were pretty cool, and these student gardens looked exceedingly backward at the middle of May; but during the rest of May and the first week of June, the weather was warm—perhaps a little unusually so—and there was plenty of moisture in the ground. Result, a tremendous catching-up.

* * *

More About Hoes

In the old days, we used to hear a good deal about the "hang" of a scythe. I wonder how many of our readers have ever bent the shank of a hoe to give it a more suitable angle for the work in hand? I have a very interesting letter from a reader, Mr. L. C. Williams of Rushville, who says, "I hate a weed." But he rather takes for granted that the hoe is not a very important implement any more. It is true that much of our work can be done much more cheaply by machinery than by hoe. On the other hand, if the general policy of a farm keeps weeds down to a minimum, a very rapid trip through with a hoe will often dis-

pose of weeds which would otherwise go to seed and so make a whole flock of enemies for next year. Then, when it comes to the home garden, quick clipping, both in the row and between rows, may dispose of the weeds with considerably less labor than an actual job of wheel-hoeing or horse cultivating.

So, we are not yet done with the proverbial and plebian hoe; and, as long as we need it, we should select carefully the one that we buy, keep it in good order, and perhaps most important of all, learn how to use it.

* * *

Meetings

The Vegetable Growers Association of America is to hold its meeting at Philadelphia the week of August 26. This will be a great opportunity for New York growers to see something of the vegetable business as carried on in Pennsylvania and New Jersey. These two states are very different from each other. Pennsylvania is growing vegetables more than ever before. The canning industry has jumped forward and a number of specialty crops and specialty farms have been developing. Tours will be a special feature of the meeting to such places as the King, Starkey and Becker farms near Trenton; the Seabrook Farms where freezing of vegetables is going forward on a large scale in South Jersey; and to Philadelphia markets.

Other forthcoming events are the Annual Field Day of the Empire State Potato Club at Gilbert Prole's farm, Batavia, New York, on August 8, and the summer meeting of the New York State Vegetable Growers Association to be held at the Experiment Station at Geneva on August 14.

* * *

Frosts

At Ithaca, the minimum temperature at the weather station was down to 39° on June 19. Reports of frost a little further from the lake have been coming in almost every day; also from territory east of Ithaca.

A curious feature of this frost situation is that it is a bit difficult to get much information about what has happened. It seems odd that the Weather Bureau does not have a system for prompt and adequate reporting from any except its major stations. Weekly postcards do come in from volunteer observers. Perhaps agriculture would do well to seek fuller service now that the Bureau is in the Department of Commerce.

"It's the ump. He called a strike and everybody agreed with him."

YOU CAN SEE THE *Difference* IN LAYENA EGGS

Housewives can really see the difference in Layena Eggs . . . whites are firm — yolks are all the same lemon-yellow color — shells are strong and dense—and they taste better, too.

Thousands of letters tell how members of some families refuse to eat other than Layena eggs. Dieticians even prescribe them in many instances!

In cooking, housewives report that the viscous whites cause their cakes to be light and fluffy . . . poached eggs stay together . . . eggs-on-toast are more tempting because yolks stand up on the firm whites. In fact, it's a pleasure to produce eggs that bring so many favorable comments. You'll take pride in seeing housewives and other consumers actually grateful to get your Layena eggs — and readily pay several cents above the market price for them!

Free Cartons FOR LAYENA PRODUCERS

When you put your hens on the Layena Plan, your Purina dealer will furnish you, without charge, attractive Checkerboard cartons. By packing your eggs in these cartons, you immediately identify them as Layena eggs, known throughout the East as market eggs of the highest quality.

In addition, your Purina dealer will furnish you without charge a rubber stamp bearing your name so that you can personalize each carton; a book entitled "49 Ways to Sell Eggs for More Money"; an attractive fiber road sign; and other sales helps, at actual cost.

On every Layena carton is printed a money-back guarantee, assuring the customer that Layena eggs are uniform in yolk color and of the highest quality in every respect. This guarantee is backed by Purina Mills, giving you an added selling point.

PRODUCE *Layena* EGGS TO GET TOP PRICES

PART III Home Coming

OUR DAYS IN HAWAII passed too swiftly. We said our goodbyes. A million ribbons of serpentine streamed from the sides of our ship as it moved slowly away from the crowded dock. Our hearts were in our throats; tears filled our eyes. We had been told that when we sailed away from Hawaii we would be stirred emotionally. We thought our parting would be just an ordinary farewell. Coming over the Purser said he had sailed from these Paradise Islands a hundred times and each time the singing of the Aloha to the soft music of the Hawaiian Band made him shed tears. I thought he was just soft. Now I know differently. For when we left, our eyes were dim with tears and we didn't care who saw them—were not the eyes of all about us equally moist? But how could we feel otherwise when a dozen, yes twenty, leis were put over our heads by loving friends and with each lei an Aloha—a fond farewell.

Crowds and crowds came down to see each boat off, following a beautiful Hawaiian custom which we hope will never die out. We saw dimly through our tears as we heard the last of Queen Liliuokalani's "Aloha Oe" followed by "God Bless America" which bound our hearts together. We sailed on past Diamond Head, and wreaths from around our necks were thrown into the sea to drift to shore as a symbol that we would come back again.

IF you like to go back to the beginning of things as I do, then read a bit of my Volcanologist friend's, Dr. T. A. Jaggar's, story of the long ago:

"Thousands, hundreds of thousands, of years ago there was nothing but endless blue sea and sky where the Islands now stand. Then there were no Hawaiian Islands. At least you couldn't see them. But deep in the sea, in the ooze and darkness, great forces were stirring. Slowly, as ages passed, countless volcanic eruptions under the seas built up mass after mass of lava layers until at last fiery cinder cones projected above the waves."

Now when you and I follow Dr. Jaggar's thoughts, we begin to understand how wind and waves could gradually wear down these surface rocks, forming soil. Birds and ocean currents brought seeds, which took root. Through the ages land was formed, trees grew, man came, and today we have these beautiful volcanic Islands of the Pacific, our lovely Hawaii.

WITH the arrival of trading ships came rats, which multiplied to such an extent that the mongoose was brought in from India to kill the rats. Now the mongoose have multiplied, gotten lazy, and are a nuisance. An old guide told us that a mongoose was eating a stalk of sugar cane when an old rat came up and asked him for a piece. "All right," said the mongoose, "I'll give you some of my sugar cane if you will play for me on your ukelele." So the mongoose and the rat became friends. One furnishes the sugar cane and the other the music and both live happily together.

POI comes from the roots of the taro plant. These roots are baked in an oven, then beaten with a stone and water added to make a thick paste. Poi is eaten with your fingers—one finger poi, very thick, two finger poi, medium, and three finger poi, thin. A LUAU is a native Hawaiian feast similar to our barbecues. With food and drink and music, it's a whole night affair, and such a gastronomic dissipation that we have postponed our LUAU until our next visit.

WITH our Stars and Stripes over every school, with "God Bless America" sung lustily and loyally by all, I came away from Hawaii with feelings of joy and pride over our new-found friends who are a part of this America which we so fondly cherish in our hearts. I close with a song of old Hawaii:

"There's the perfume of a million flowers
Clinging to the heart of old Hawaii
There's a rainbow following the showers
Bringing me a part of old Hawaii.
There's a silver moon,
A symphony of stars,
There's a hula tune,
And the hum of soft guitars,
There's the trade wind sighing in the
heavens,
Singing me a song of old Hawaii."

"League Members Will Fight for the American Way," Says Sexauer

THE fact that milk prices for several months have been much above a year ago lent an air of optimism to the 21st Annual Meeting of the Dairymen's League at Utica June 19 and 20. In his annual report, President Fred Sexauer told delegates that, during the past fiscal year, the League marketed milk for 30,877 members and did a total business of \$56,253,587.51, an increase of \$3,000,000 over the previous fiscal year. In spite of an increase of over 20,000,000 in milk handled and in the face of increased wage rates, the total cost of doing business during the past fiscal year was lowered by over \$400,000. Considering the year as a whole, returns to members were 16c a hundred higher than during the previous year, resulting in an average increased income of \$167 per member.

"In March alone," said the President, "League members received \$1,891,155.15 more than they received in March a year ago after the Marketing Agreement had been suspended as a result of court decisions."

In his report, Mr. Sexauer stressed two points—support of the Federal-State Orders and support of American democracy. He charged that the real object of the strike last summer was to destroy the Marketing Order.

"Some dealers", he said, "did not like the solidarity that had grown up among farmers as a result of the Order. Other dealers wished to see it broken because they thrive on a demoralized market. The Communist Party would like to see the Order broken because it thrives on desperation and suffering of human beings."

The American Way

In speaking of the American way, Mr. Sexauer said:

"The Dairymen's League Cooperative Association stands for the American way. The American way has a rather broad meaning to most people. To me the American way is the way of liberty but NOT LICENSE. It is free speech but NOT SLANDER OR LIES. It is the right to decide when and where to go but NOT THE RIGHT TO DICTATE where and when others may go. It is rule by majority, not by noisy, violent, unlawful minorities."

"It is the golden rule, not the iron rule. It is the settlement of disputes by legal means, not by brickbats, clubs or guns. It is the right to deliver milk or any other product to market or keep it at home as the owner may decide, not the right to prevent delivery by blockade of roads, threats or intimidation. It is the heritage fought for by our fathers and handed down from generation to generation and not philosophy of Communism, Nazism or Fascism from Russia, Germany or Italy."

"Yes, the Dairymen's League Cooperative Association stands for the American way. Not only does it stand for it, but its members have proven that they will fight to preserve the American way."

A New Administrator

Many of the delegates at the meeting had their first opportunity to meet N. J. Cladakis, the new Milk Market Administrator. He emphasized that market stability is the goal of regulation. Said he:

"Only a sound program can be a lasting one. The soundness of the Federal-State Orders in the New York milk market must be jealously guarded by every producer in the milk shed. The federal and state governments are determined to keep that program sound, and it can be done with the help of all who are interested in the

FRED H. SEXAUER
President of the Dairymen's League

welfare of this great dairy industry."

Commissioner of Agriculture Noyes stressed the danger of continued increases in milk production. The Commissioner pointed out that last November 87.06 per cent of the milk shipped into the metropolitan market was used in the higher classes, while in April only 55 per cent was used in the higher classes.

"I am not one of those", said the Commissioner, "who hold the law of supply and demand to be sacred. Because of the very unusual conditions surrounding the production and marketing of milk, I certainly do not think it can be left to the unregulated operation of this law."

The Commissioner pointed out that in many dairies at least ten or fifteen per cent of the cows are poor producers and would not be profitable no matter what the price of milk might be.

"If all of the unprofitable cows were sent to the slaughter house," he said, "it would materially reduce surplus milk and improve prices."

Commissioner Noyes further said:

"Nothing has pleased me more than to note in the last year, particularly, the growing willingness of our dairy groups to know each other by meeting together, discussing dairy questions together, and finally, and most important of all, being satisfied and willing to abide by the will of the majority once the discussion was ended and a vote taken."

"There had to be general agreement upon the need of price regulation before we could get the Order. There will have to be the same understanding before we can make any progress in production regulation. But once that need is recognized, and if our farmers then will show the same cooperative willingness they have shown in other ways during the past year, I am confident we shall see the issue settled promptly and satisfactorily."

League Women Have Program

One of the speakers mentioned that in the first few annual meetings of the Dairymen's League, women were noticeable principally because of their absence. Doubtless one reason for the considerable number of ladies in the audience on Thursday was the program especially designed for them on the previous day. Around 1200 women delegates attended that meeting and heard talks by Miss Lena Phillips, President of the International Federation of Business and Professional

Women, and Miss Vera McCrea, Director of the League's Home Department.

Miss Phillips said that farmers, industrialists, and laborers in this country must work for one another's good if the United States is to escape totalitarianism. She stated that if everyone ate what the Home Economics Bureau of the U. S. Department of Agriculture calls a "liberal diet", we should have to grow crops on 40,000,000 more acres.

At the Wednesday evening program talks were given by three young people. Miss Anna Fusek of Waterville talked on "Those Czechs of the Hill." Clayton Young of Randolph, President of the New York State branch of the Future Farmers of America, spoke on "Youth and Agricultural Cooperation." Phillip Dewey of Tioga County, Pennsylvania, upheld the advantages which a country boy has compared to those of his city cousin.

Resolutions

Because the Resolutions Committee had been in session in Utica for two days previous to the meeting, resolutions were in printed form to be handed to each delegate. The following resolutions received favorable action by the delegates:

1. Extending the thanks of the Dairymen's League to the member cooperatives of the Metropolitan Bargaining Agency, farm organizations of New York State, Secretary of Agriculture of the United States, Commissioner of Agriculture of the State of New York, and AMERICAN AGRICULTURIST for constructive efforts in behalf of dairymen.
2. Encouraging Dairymen's League officers to cooperate with reliable organizations in securing marketing orders in upstate cities.
3. Urging amendments to the Marketing Order to provide for advance reports and payments by handlers to the Administrator.
4. Recommending continuation of a program for free testing of all TB accredited herds.
5. Recommending that federal and state governments make adequate appropriations to recompense dairymen for cows condemned because of mastitis.
6. Favoring continued and increased expenditures to eradicate Bang abortion.
7. Recommending that farm boys and girls be considered in working out a membership program for the cooperative movement.
8. Requesting that the management of the Farm Credit Administration be vested in a Board of Governors responsible over the Congress.
9. Commending the Federal Trade Commission for their order forbidding manufacturers of oleo to use misleading statements in their advertising.
10. Reaffirming resolutions passed in 1936, 1938 and 1939 favoring a currency of stable buying power.
11. Urging that the State Conference Board of Farm Organizations present to the state legislature a measure providing that Standard Time be the sole official time in the state.
12. Commending the directors, executive committee, and officers of the League for their work during the past year.

* * *

Directors Organize

At the first meeting of the Board of Directors for the new year, held the day following the meeting, all officers were reelected as follows: President, Fred H. Sexauer, Auburn, N. Y.; First Vice-President, H. H. Rathbun, New Hartford, N. Y.; Second Vice-President, L. M. Hardin, Sussex, N. J.; Treasurer, J. A. Coulter, Watertown, N. Y.; Secretary, L. A. Chapin, North Bangor, N. Y.; Executive Assistant, George R. Fitts, Cortland, N. Y. Members of the Executive Committee will be: Fred H. Sexauer, J. A. Coulter, L. A. Chapin, H. H. Rathbun, and E. C. Strobeck.

CHEESE for SNOWBALLS on Andy Jackson's Lawn

(Continued from Page 1)

thing to do with the big cheese which had become a local wonder of the world.

When they got to the Colonel's place, he had the big cheese out in the barnyard on a fancy wagon with painted sides and big letters which read, "New York Cheese Is The Best In The World: Eat More Of It!" and other things like that. And the Colonel took all the grey horses and hitched them up to that wagon, and the parade started down across the country roads toward Lake Ontario. The parade gathered many people as it went along; so that when the cheese finally got to the lake where a boat was waiting, the parade was about half a mile long and getting bigger every minute.

The Colonel was a proud man that day as he rode along at the head of the procession on his big grey horse; for he knew that he was doing a notable thing for all the folks in York State. And when he himself got off his horse and addressed that cheese direct to Andy Jackson, The White House, Washington, D. C., people went crazy because the Colonel's wild idea began to take on some meaning.

"Sure", they were saying, "if Andy eats that cheese and likes it, then York State cheese will take a boom and all we upstate farmers will get rich."

And so they cheered the Colonel and that cheese while it was being loaded on the boat and while it was started on its way to the White House and Andy Jackson. Then they went back to their plowing to wait developments.

Now Andy Jackson was an easy-going fellow in lots of ways, but he had a temper and he could cuss. So when one day a mailman, or a truckman or whoever it was in those days who did the big package business, came up on the White House steps and announced that he had a cheese for Andy Jackson—a cheese weighing 1500 pounds and seven feet high—Andy began to cuss so that lots of people stopped by to see what was the matter.

But when Andy saw that the label read, "To Andrew Jackson, President of the United States, from the people of the State of New York," well, Andy scratched his head and said:

"Boys, that cheese is political dynamite, so we'll have to put it somewhere, but *where* I don't know."

You see, the cheese hadn't really cured very well, and was considerably strong; and Andy didn't really want it around the house for fear it might offend the foreign ambassadors when they came to call. Finally he had the cheese put in an outhouse, where it stayed for two or three months while Andy was deciding what he'd better do with it.

Now, when the Colonel didn't hear anything from Andy about the cheese, he wrote Andy a letter, asking him if he didn't like the cheese and if he didn't think it was the best in the world. Andy wrote back, saying that he hadn't decided what public use to make of the cheese yet, but that he had tasted it himself and found it delicious. And he sent the Colonel a present of Spanish wine. When the folks in Oswego County saw that wine, they knew that Andy was behind 'em.

Now the time soon came when Andy's helpers began to need that outhouse space for something else than the biggest cheese in the world, and they began to ask Andy if they couldn't dispose of it; but Andy had another idea.

One day in spring when the cherry blossoms and the apple blossoms were in bloom, Andy sent out an invitation

to the House of Representatives and the Senate and the Supreme Court and the Cabinet, and the whole city of Washington, D. C., to come to the White House to a great cheese party. Daniel Webster and all the rest of the great men of the time came as well as the entire city of Washington to gather around that big York State cheese which was carried out on the White House lawn . . . And as there weren't enough forks to go around, the guests just reached into the cheese with their bare hands and drew out

handfuls of cheese which they ate, or pretended to eat, because Andy Jackson was watching them with the eye of a hawk.

And after they had eaten all they could hold of the cheese, some of the senators began to get playful and began pelting each other with balls of cheese. When the senators did that, all the rest of the people did too; and there took place on the White House lawn a great cheeseball fight which lasted nearly all afternoon. The whole city, they say, stank of York State cheese, and no one was prouder than Andy Jackson. He wrote to Colonel Meacham that the cheese had been a great success and that everyone was saying how fine it was and where could they get some cheese just like it.

When the people in Oswego heard

that, they went crazy, and doubtless elected the Colonel to some high office, although I don't know just how that turned out. I do know that the Colonel became more grandiose than ever, built the biggest barn in the world straight off, and advertised it as such. The Mayor of Rochester, who heard about the biggest cheese in the world, sent the Colonel a personal present of the biggest barrel of flour in the world (to help advertise the Rochester mills), and the Colonel took the head of that barrel and set it in the gable of his big barn like a rising sun in remembrance of all big things. . . .

It would be a fine thing if ALL the economic problems of York State in the present day could be as easily solved. Perhaps WE don't use enough imagination.

WHY PAY MORE? WHY ACCEPT LESS?

when Chevrolet gives so much and costs so little!

Hundreds of thousands of buyers agree that *the big value for '40 is CHEVROLET; and they insist that it tops all other cars, regardless of price!*

These people ask, "WHY PAY MORE than Chevrolet's low prices, when Chevrolet provides all the necessities and most of the luxuries of modern motoring?"

And then they ask, "WHY ACCEPT LESS than Chevrolet's outstanding dollar value, when Chevrolet offers so many advantages of higher priced cars at tremendous savings in purchase price, gas, oil and upkeep?"

Be wise! . . . Buy as America is buying! . . . Buy Chevrolet!

"CHEVROLET'S FIRST AGAIN!"

Balancing Supply and Demand

By LELAND SPENCER

THE GREATEST change in the fluid milk industry during the past 25 to 50 years has been the shift from competitive prices, or supply and demand prices, to price fixing by public authorities. Now, in the days of supply and demand prices, a sort of automatic adjustment

Leland Spencer

was maintained between the supply of milk in any market and the fluid sales. Of course, there was some surplus milk, especially in the flush season, but as a rule the supply in the short season was barely adequate to fill the daily orders for fluid milk and cream. With the development and general acceptance of such slogans as "a living price for milk," new methods of keeping the milk supply in proper balance with fluid sales had to be devised. In the New York milk shed, six important steps have

been taken in the last 20 years, or are being considered at the present time, for the main purpose of balancing the supply and demand for milk in such a way that the price could be maintained at a higher level than would be dictated by free competition. The six steps are:

1. *Classified price plan* (1921). Object is to permit pricing milk for fluid uses separately from that used for manufacture. Makes it easier for a dealer to utilize inspected milk for manufacture.

2. *Pooling or equalization* (partial, 1921; complete, 1938). Object is to insure all approved producers of an equitable share in fluid markets and to remove pressure upon producers and dealers to cut prices in order to hold or to increase their fluid outlets.

3. *Price fixing by public authorities* (state, 1933; state and federal, 1938). Object is to use police power of the state to enforce specified prices for the several classes of milk. Supplies not sold at these prices have to be diverted into manufactured products or shipped out of the milk shed.

4. *Market service payments* (1938). Object is to compensate dealers and cooperatives for diverting milk to other than fluid uses. Under present state and federal orders for the New York market, dealers or cooperatives are allowed 23 cents per cwt. for plant handling and up to 13 cents per cwt. for hauling milk that is diverted from fluid plants to manufacturing plants.

5. *Subsidized distribution of milk to low-income families and needy school children in the cities*. Object is to make milk available to needy families at prices they can afford to pay, while holding regular fluid price at higher level. By this means, it is hoped to increase the consumption of fluid milk and also to check consumer opposition to the price fixing program.

6. *Production control*. Object is to regulate the quantities of milk sent to market by producers, so that prices will not be depressed unduly by large surpluses.

The first four of these steps or procedures are already in full effect. A plan for subsidized distribution of milk to needy families in New York City is now being worked out by federal and city officials. It is expected that substantial quantities of milk will be made available at retail cost of as low as 5 cents a quart. The difference between this price and the regular charge will be made up in three ways; namely, by a reduction of 57 cents per cwt. in the Class 1 price to producers, a reduced charge by distributors for distribution services, and subsidy payments by the federal government.

So far, direct production control of milk has not been attempted in New York, but the matter is being discussed, and committees have been set up by

the producer bargaining agencies to study the possibilities. It would seem that production control in some form is a logical and necessary step to be taken if the idea of supply and demand prices is to be abandoned permanently.

Bargaining Agency Asks for Milk Price Increase

The Metropolitan Cooperative Milk Producers' Bargaining Agency has filed a petition with federal and state governments for a price amendment to the Federal-State Milk Marketing Order for New York City. The price schedule asked for would fix a minimum price for Class I price at \$2.35 for April, May, June and July, and \$2.82 for the balance of the year. These minimum prices would be increased if butter prices go up.

The price for winter months is the same as the Class I price last winter which was established by an amendment to the Order secured because production costs were increased by last summer's drought.

The proposed new prices will average about 16c a hundred more than the present schedule. The reason given for the proposed increase is the extra cost to dairymen of meeting new New York City Board of Health regulations which will go into effect September 1. On that date dairymen shipping to the metropolitan area must produce milk under conditions practically equal to former Grade A requirements. Also, new rules

and regulations will increase hauling costs from farms to plants.

Inasmuch as the new minimum price for winter months is the same as that prevailing last winter, it is felt that it will be unnecessary to increase retail prices above those charged last winter.

The Bargaining Agency has requested a speedy consideration of their request in order that the new price might go into effect on August 1.

Dealer Fined for Low Milk Tests

Recently the Pennsylvania Milk Control Commission started legal action against the M. H. Renken Dairy Company of Westfield, Pa., charging manipulating of butterfat tests of milk as delivered by their patrons. On June 6 Justice of the Peace C. E. Irons of Elkland found the company guilty and fined them \$200 and costs.

Evidence was submitted that butterfat readings were under-read as much as two points. Two former Renken employees testified that while they were employed by the company they had been directed to "read down the butterfat tests."

The defense claimed that tests vary upwards as well as downwards.

It is estimated that the plant handled approximately 500,000 lbs. of milk during the two weeks period covered by the investigator's check-up, and that in that period it was probable that dairymen delivering to the plant had been underpaid by about \$250.

Cooperatives Discuss Credit Problems

MOST interesting was the meeting of some 300 cooperative leaders interested in farm credit, who met on June 24 at Springfield at the annual Stockholders Meeting of the Springfield Bank for Cooperatives, jointly with the conference of New England Institute of Cooperation.

Heading the list of interesting speakers during the two days meeting was Albert G. Black, Governor of the Farm Credit Administration, who said that farmers' cooperatives will play a more important part in agriculture, due to new problems in marketing and production, and agriculture itself will play a more important part in the nation and its national defense.

George W. Lamb, President of the Springfield Bank for Cooperatives, J. Robert Doe, Treasurer, and Albert B. Loring, Secretary, made their annual reports to the Bank's stockholders. Pointing out that the Bank itself is a cooperative institution, Mr. Lamb said the Bank was providing about \$4,000,000 of credit to 72 farmers' cooperatives in the Northeast. Cooperatives in New England, New York, and New Jersey, numbering about 700, are in the best position they have been at any time

since 1934. Many are completely out of debt, many others are on their way out.

Dr. F. B. Bomberger, President of the Baltimore Bank for Cooperatives, said that farmers' cooperatives now have a membership of some 2,000,000 farmers or one-third of all of them. There are in the United States 10,900 cooperatives, doing an annual business of \$2,500,000,000.

Mr. Marcus L. Urann, one of the Farm Credit Directors for the Northeast, and the head of the great Cranberry Canners cooperative, said that cooperation is essential in a democracy if the democracy is to follow a course of procedure as efficient as dictatorship.

Among the other speakers were William H. Martin, Dean and Director of the New Jersey College of Agriculture; J. D. Lawrence, Deputy cooperative bank commissioner; Romeyn Berry, farmer, writer, and lecturer; Ken E. Geyer, Manager of Connecticut Milk Producers Association; Earl W. Benjamin, General Manager Pacific Egg Producers Cooperative; Professor M. P. Rasmussen of Cornell University; and Quentin Reynolds, Manager of the Eastern States Farmers Exchange.

CONCRETE puts cheer into chores!

MAKES everybody's work easier—that's what concrete does on any farm! Housekeeping is only half the work when there's no mud tracked in. Milking, feeding and watering stock, stable cleaning, *all* the chores around barn and house can be done easier, better and with less help when clean concrete is on the job.

Look over your own farm. Jot down the many places you can put in concrete with little effort and low cost, and profit *permanently*. Check the concrete uses you're interested in and mail this ad with your name and address for a mighty valuable 72-page free book: "Plans for Concrete Farm Buildings."

THE LEAGUE STANDS FOR THE AMERICAN WAY

...FROM THE FAREWELL SPEECH OF PRESIDENT JOHN QUINCY ADAMS TO

Marquis de La Fayette

LOVE of liberty is the greatest love with many men. Countless thousands have risked their lives and fortunes in defense of it.

One of these was the Marquis de La Fayette of France. Only 20 years of age when the American Revolution broke out, he left a young wife and a new-born babe to fight for America. He even bought his own ship to carry himself and his companions across the ocean—and from Brandywine to Yorktown was one of Washington's most trusted Major Generals. Other Frenchmen followed him . . . until at last one-third of all men killed in the American Revolution were French citizens.

Generations of peace and freedom have lulled some people into a sense of false security . . . have dulled in their hearts the swift instinct to fight jealously against the slightest invasion of their liberty.

That's how farmers once lost the right to control their own industry. That's why it took almost 50 years to arouse the great body of farmers to realization that valuable rights had been quietly stolen away from them . . . to realize that the only way they could win back their independence and rights was to unite and fight for them.

The Dairymen's League was the first successful rallying point for these farmers. It gave them the strength of organization . . . the counsel of many minds . . . the unity of elected leadership. It gave them a powerful voice that thundered to be heard in the courts, in legislative halls and from public forums all over the milkshed. And it attracted to their banner many liberal-minded men—lawmakers, editors, economists—men who like La Fayette, heard the call of liberty, and abandoned their own private interests to enlist in the fight.

Only an organization such as the Dairymen's League—founded on the very principles of American freedom and government—could have attempted so much and accomplished so much for farmers.

Published by

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

"Freedom and Opportunity

make America the Best Place to Live"

says

JOHN GERNATT

"America is the best place in the world to live," says John Gernatt of Collins, N. Y. Thirty-six years ago he came to America with \$40 in his pocket. Today he owns 350 acres of rich farm land. He is a citizen of 22 years standing, and he has belonged to the Dairymen's League since it started. "Farm organizations have been a great help in making our farming a success," he says—"every farmer should join one."

Three of his sons run nearby farms. One is in college. All enjoy freedom and privileges that were denied in the Old World. "In the Old Country we had five-acre patches which we called our farms," he says. "There was a great deal of hand work; even the women and children worked in the fields. Oats, wheat and other grains were cut with a hand scythe. In this country, we have tractors and other farm machinery. We have fine horses instead of oxen, and we all own automobiles. The difference between oxen and a tractor is the difference between the Old World and our new home."

Modern, well-kept buildings, fine livestock and improved farm machinery all play a part in John Gernatt's successful dairying operations.

From SKEFF'S NOTEBOOK

By L. B.
SKEFFINGTON

AGRICULTURE is willing to do its part in a national emergency program, but it believes that agriculture's own representatives are qualified to develop practical, workable plans.

This was the view expressed in a resolution adopted at the meeting of the New York State Agricultural Land Use Committee at Cornell University. It was not merely a case of "resolving," but action was taken after serious discussion of the subject.

The Land Use Committee met for two days, with the afternoon of the second day reserved for reports of subcommittees. Mrs. Henry M. Wagenblass of Warsaw, reporting for the subcommittee on rural social resources, brought in the resolution on this subject. Chairman L. R. Simons told the gathering that the whole emergency situation was one of greatest importance, and he suggested there be frank discussion.

The subcommittee report pointed out that millions of persons are being made homeless by war, and that heavy supplies will be required to feed, clothe and shelter them.

"In view of the acute and growing problems (the resolution read) it is suggested that the New York State Land Use Committee urge the National Defense Council, through its agricultural representative, Mr. Chester C. Davis, to consider thoroughly the vital importance of agriculture and food supply in the national defense program and to devise ways and means of feeding the hungry refugees.

"And it is further suggested that we urge that in any agricultural program undertaken in connection with the present world emergency that farmers, through their own organizations, their extension service and Land Grant college institutions, be given every opportunity in helping to develop workable plans."

Would Inventory Good Land

Seasonal inventory of supplies of good seed crops and survey of good, unused farm land also were urged by the committee. Resolutions on these topics were introduced by H. J. Evans of Georgetown as chairman of the subcommittee on land conservancy problems.

(**EDITOR'S NOTE:** *American Agriculturist* believes, as does every farmer, in preparedness, and it is true that there is likely to be a shortage of food in Europe during the coming winter. This does not mean, however, that we should plunge into the production of food as we did in the last war, until there is real evidence that increased production is needed.

We are not yet out of the hard times in agriculture caused by overproduction during the first World War. The suggestions made by the New York State Land Use Committee reported here are not intended to influence you to increase production, but are intended instead to do everything possible to put your farming on a business-like and safe basis so that you better can meet any emergency, whatever it may be.

The opinion of the editorial staff of *American Agriculturist* is "that the best way to prepare for whatever may come is to have more than one source of income and to use more of the products of your own farm.)

Tax Revision Urged

One of the longest and most detailed reports was that of the subcommittee

on taxation headed by Harold M. Stanley. This committee had given serious consideration to land values, land income and the tax load. It suggested that real estate be assessed at full value, as nothing was gained by any other method. But it also suggested that study be given to some form of state-collected tax that would replace the real estate tax on farms.

It urged that towns, districts and counties adopt budget systems; that permissive legislation be enacted which would enable groups of towns, after referendums, to consolidate or share their government and expense; that educational work be undertaken to show the advantages of zoning for counties and towns.

Use of tax maps, establishment of local boards of assessment review, transferring of public utility assessing from local officials to state experts, state purchase of highway rights of way, and payment of state highway aid on present mileage were urged. Stanley said that in some cases town roads

that are not needed might be abandoned, except that towns fear reduction of their state highway aid funds.

Study of the problems created by the state's 600 one-teacher schools was urged, but at the same time it was advised that more study be given to laying out central school districts. Every town, district and county was urged to give taxpayers a simplified annual report which they could readily understand. The State College of Agriculture, the Association of Towns and other groups were urged to join in educating the public on problems of government and taxation.

Fruit Research Reviewed

Highlights of research work in growing and marketing fruit were summarized at the Geneva Experiment Station for Eastern and Western joint fruit committees of the State Horticultural Society and the State Farm Bureau Federation.

These committees have been in the process of organizing in recent months and already have made a start toward analyzing problems of the fruit industry. Earl D. Merrill of Webster is chairman of the western group and Walter Clarke of Milton heads the eastern committee. As it is expected that in due course the committees may make recommendations regarding research, marketing and other problems, a review of the research program now in effect was considered fundamental.

Ladd Gives Keynote

The Geneva gathering was keynoted by Dr. Carl E. Ladd, state college dean

The Republican National Platform

ON JUNE 26 the Republican Convention at Philadelphia adopted a platform. For your information, here are some of the high lights of it.

NATIONAL DEFENSE—Build up the national defense to protect the United States and its possessions and to uphold the Monroe Doctrine.

"The Republican Party is firmly opposed to involving this nation in a foreign war."

Extend to peoples fighting for liberty such aid as is consistent with international law and not inconsistent with the requirements of our own defense.

AGRICULTURE—The platform promises "such governmental policies, temporary and permanent, that will establish and maintain an equitable balance between labor, industry and agriculture . . . thereby creating increased consumer buying power for agricultural products."

The plank on agriculture proposes benefit payments based on a soil conservation program free from government-designated production control, and administered, as far as practicable, by farmers themselves; to restrict major benefits of these payments to operators of family type farms.

The platform demands an end of one-man tariff making, and efforts to protect farm products by tariff and regulate export markets.

"We shall promote a cooperative system of adequate farm credit . . . supervised by an independent governmental agency, with ultimate farmer ownership and control."

The platform favors quarantines against livestock from countries where health standard requirements are not equal to our own.

MONEY—The platform states that Congress should reclaim its constitutional power over money and withdraw the President's authority to manipulate the currency.

"We shall repeal the Thomas Inflation Amendment of 1933 and the Foreign Silver Purchase Act of 1934."

GOVERNMENT SPENDING—"We solemnly pledge that public expenditures, other than those required for full national defense and relief, shall be cut to levels necessary for the essential services of government."

"Our American system of private enterprise, if permitted to go to work,

can rapidly increase the wealth, income and standard of living of all the people."

"We shall revise the tax system and remove those practices which impede recovery, and shall apply policies which stimulate enterprise."

LABOR RELATIONS—The platform promises maintenance of labor's right to free organizations and collective bargaining, but calls for amending the National Labor Relations Act in fairness to employers and all groups of employees.

GOVERNMENT COMPETITION—"We promise to reduce to the minimum, federal competition with business."

"We promise to encourage the small business man by removing unnecessary bureaucratic regulation and interference."

GOVERNMENT REORGANIZATION—The Republican platform proposes to reestablish the Federal Civil Service on a real merit system; also maintenance of the American system of checks and balances, declaring that "the constitutional distribution of legislative, executive and judicial functions is essential to the preservation of this system."

RELIEF—"We shall remove waste, discrimination and politics from relief . . . thus giving the men and women on relief a larger share of funds appropriated."

OTHER PLANKS—The platform maintains in vigorous language that the record of the present administration is a record of failure. The platform proposes an amendment prohibiting a third term for a president; the giving of stock and commodity exchanges the fullest measure of control consistent with the prevention of abuse; condemns the New Deal for encouraging "various groups that seek to change the American form of government by means outside the Constitution"; favors strict enforcement of all laws controlling the entry of aliens; promises enforcement of anti-trust legislation without prejudice or discrimination, and favors the administration of Social Security by the states with a minimum of federal control.

Following the Democratic Convention, we plan to summarize the Democratic platform as adopted.

Willkie Wins

Six months ago Wendell L. Willkie of Indiana was comparatively unknown. Then somebody suggested that he would make a good President of the United States. The idea took hold like wildfire, ending with Willkie's nomination by the Republican Party at its Convention in Philadelphia on June 27 after one of the most enthusiastic and interesting Conventions the Party ever had.

The nomination of Willkie was a good example of what can be done by people in a democracy. Politicians would have none of Willkie, but the people wanted him and expressed their desire emphatically to the Republican delegates. Starting in third place at the first ballot at the Convention, Willkie steadily gained over his chief rivals, Taft and Dewey, until he was nominated on the sixth ballot. Probably no one was more surprised than Mr. Willkie himself.

Now it remains to see who the Democrats will nominate, and then will follow one of the greatest political battles in the nation's history. Whoever is chosen by the people to lead this nation will face crisis after crisis, and will be a large factor in determining the fate of our democracy and all its citizens.

and director of experiment stations. He referred to the job that had been done by the old Western New York joint committee 12 or 15 years ago. He said this committee took two or three years to make a thorough study of problems affecting the industry, and that as a result the course of the industry has been changed.

Because problems and conditions have changed so much in recent years Dr. Ladd said growers had recognized the need for further study. As showing how conditions change, he referred to pomology as "a new science" compared to matters discussed at fruit growers' meetings of 25 years ago.

The work of the economist in a fruit program was explained by Dr. F. A. Harper "to diagnose ills, or reasons for degree of success or failure. Sometimes this diagnosis discloses conditions that must be solved in other fields. Farm management studies on some farms over a period of years show why some growers are more successful than others. Studies eliminate guess work and provide factual material. It is important to isolate ills before remedial measures can be prescribed."

Harper said marketing, disposition of crop and cost of distribution are being studied. He said it was important to find out what consumers are willing to pay, and suggested the retail part of the distribution system offers some hope of economy.

New Trends Discussed

An important hope of growers is for a non-poisonous spray and Dr. Charles Palm reported on work in this field. He said some vegetables oils have shown a tendency to hold nicotine for longer protection of fruit. A 50 per cent loss of strawberries was reduced to two per cent, he said, by using a mixture of lead arsenate and sand at time of setting the plants. He mentioned instances of this sort as showing how the station tries to meet pressing problems as they are brought to it by growers.

"The more we know about the fundamental nature and functions of plants we deal with, the more likely we are to avoid unnecessary expensive practices and to do the things which promote production and longevity of the orchard," said Dr. A. J. Heinicke. He mentioned changes in pruning practices. "We now know annual pruning seldom gives better results than pruning every two or three years," he said.

Ideals and progress of work at Geneva was summed up by Director P. J. Parrott and members of his staff.

Policyholders

WARREN, VERMONT BALL TEAM

BACK ROW, LEFT TO RIGHT: Lyle Ford; Miles Greenslit; Francis Whitworth; Ransom Tucker; Riordan Drew.

FRONT ROW: Lorne Whitworth; Robert Gove; Gilbert Pierce; Fred Buzzell.

Two Ball Players Struck Out in Auto Crash One Carried Our Policy

TWO of the town's finest young men, Francis Whitworth and Gilbert Pierce were riding in an automobile which was struck by a train. Both were killed.

Francis Whitworth's parents re-

ceived a check for \$1,000.00 as Francis carried a North American Travel Accident Policy. Our agent told Gilbert Pierce about this low cost protection, too, but Gilbert put off taking it until "later."

The wrecked automobile in which Francis Whitworth and Gilbert Pierce were killed.

Accidents Which the Policy Covers

1. By the wrecking or disablement of a pleasure type automobile, an automobile truck, a horse drawn wagon, cart, sleigh, or sled, in which the insured is riding or driving.
2. By the wrecking or disablement of a public conveyance provided by common carrier for passenger service only (aeroplanes excluded) within which the insured is riding as a fare-paying passenger in the place regularly provided for passenger service.
3. By being struck, knocked down, or run over while walking or standing on a public street, public sidewalk or public highway by a moving vehicle.

Cash Benefits Paid as Follows

1. \$1,000.00 for loss of Life, or the loss of the sight of both Eyes; or the loss of any two members, such as a Hand or Foot.
2. \$500.00 for loss of the sight of Eye, or Hand, or Foot—Loss of Life or Member must occur within 30 days from the date of accident, otherwise weekly benefits are paid.
3. \$10.00 a week for as many as thirteen weeks while totally disabled unable to do any work whatsoever — benefits beginning immediately following the accident. No benefits are payable for partial disability.

This protection applies on accidents happening anywhere within the United States or Canada. Death benefits are payable to the insured's estate, all other benefits payable to the insured.

These benefits are paid where the insured is between the ages of 15-59 years. One-half benefits are paid ages 10-15 and ages 60-74.

By J. F. (DOC.) ROBERTS

"RIGHT is still right, in spite of might."

"Civilization is not dead or dying; you can no more kill civilization than you can education."

I heard these two things said at the graduation exercises of my youngest son at the University of Pennsylvania in Philadelphia last week. They have raised my spirits so much that I just want to pass them on to you. This was the bi-centennial graduation of this University, and it was pointed out there that in the past two hundred years Europe had been in practically total warfare three different times, and yet we had been able to maintain education and to hold graduation exercises each year. Are we any weaker than our forefathers who carried on under such conditions? I hope not.

Wool has advanced again and the government has announced large orders for woolen goods, which will include nearly 50% fine wools. Those who have not sold their wool can anticipate better than 30c for it, although I am not looking for a runaway wool market.

I have been asked a good many times why cows are selling so high when pork and even good steer beef are selling so comparatively cheap. Again the reason is the unprecedented demand for prepared meats of all kinds, and also it is becoming quite common practice to bone out the better cuts of these old cows and sell them in the poorer class of butcher shops for all sorts of purposes. It is lean meat, carrying practically no fat, and the average housewife cannot buy really good meat of any class unless it does carry considerable fat. In this way, she can protect herself from this more or less unsatisfactory cow meat, particularly when she is buying steaks or roasts.

In spite of the fact that beef cattle for breeding purposes are in greater demand than we have almost ever seen them, and are really selling high, breeding ewes have not materially advanced, and it does not look as if they would in spite of a very satisfactory lamb market all season and a wool market which has been more or less satisfactory, particularly lately. It appears to me that this would be a good summer and fall to buy yearling ewes and to cull your ewe flocks deeply. A great many sections of our Northeast are

more adapted to sheep husbandry than they are to cattle raising. It is interesting to note that the great demand for all of this breeding stock is coming from states east of Chicago, mainly Michigan, Indiana and Ohio. Their grass situation is no better than ours, and their corn situation has proved to be a whole lot worse. This movement toward the East is economically sound. We can produce stock cattle and feeding lambs cheaper now than they can on the western ranges.

On my trip to Philadelphia, I do not believe I ever saw hay any more dense or any greater growth at this time of the year. Some of the New Jersey men were haying and I hope the entire Northeast will take real advantage of our hay crop this year.

Brown Swiss Breeders Elect Officers

Edmund Schillawiski of Auburn is the new president of the New York State Brown Swiss Cattle Breeders' Association. Officers were elected at

Some of the officers of the Onondaga County Artificial Breeding Association. From left to right: Mr. Johnson, who is Manager of the Central N. Y. Artificial Breeding Association bull barn located near Syracuse; Harold Meaker, Memphis, Vice-President; Robert Church, Baldwinsville, Director; Dr. N. A. Lasher, veterinary; LeRoy Munro, Elbridge, President; J. Sears, Baldwinsville, Secretary-Treasurer; and Floyd Somes, Jack's Reefs, Director.

The two Directors not present were Hoyt Ackles and Gordon Eibert.

the annual picnic at Hill Crest Farm in Jefferson County owned by John B. Harris. Other officers elected were: Mr. Harris, Vice-President; Charles Goodwin, Guilford, Secretary-Treasurer. Directors elected for two years were: H. B. Blonge, Youngstown; John Harris, Watertown; Robert Cullings, Scottsville. Directors elected for three years were: D. N. Boice, Churchville; Harold Magnussen, Rexford; Charles Goodwin, Guilford.

High Producers for May

Among New York State herds enrolled in Dairy Herd Improvement Associations, 25 herds averaged better than 50 lbs. of butterfat to the cow,

and 3 herds exceeded a 60-lb. average for the month of May. These 3 high herds are owned by Louie Austin of Onondaga County, George Swartout of Jefferson County, and Abraham Eller of Ulster County.

The state now has 129 Dairy Herd Improvement Associations. Delaware County leads with 11, and Jefferson and St. Lawrence Counties are tied for second with 8 each.

Atwood Herd Makes Fine Record

The Ayrshire herd of J. Leon Atwood of Plattsburg, New York, has recently completed another outstanding record. With sixteen cows, one-half made up of two- and three-year old heifers, the average milk production for the year ending March 31 was 11,060 lbs. of milk and 459.68 lbs. of fat.

Best record for the year went to Cleopatra Lass No. 161427, who produced 16,704 lbs. of milk and 716.57 lbs. of fat in 366 days. The test year did not coincide with her lactation period. She has an advanced registry

record of 20,083 lbs. of milk and 838 lbs. of fat.

The second high cow was Bridget of Atwood Orchard No. 152392, with 14,653 lbs. of milk and 595 lbs. of fat in 352 days.

Another outstanding member of the herd is Red Bess of Atwood Orchard. She is ten years old, and in her life has produced better than 100,000 lbs. of milk. Last year she produced 12,223 lbs. of milk and 468 lbs. of fat.

Mr. Atwood was named a New York State Master Farmer in 1932.

Wire Floors for Calves

The New Jersey College of Agriculture recommends the raising of calves on wire screens. Their experience shows that this reduces labor costs, bedding costs, and protects the calves against cold, damp beds.

They use a 3/4" mesh wire cloth made from No. 11 wire galvanized after weaving. They construct frames of four-by-fours, 4 ft. wide and approximately 5 ft. long so they can be moved easily. Each frame is put on four legs 6" high and the wire screen stapled to the top of the frame after No. 9 wire has been stretched over the frame. This No. 9 wire strengthens the floor and helps carry the load. It is suggested that heavy woven wire fence, 4 ft. in height, could be used. Calves weighing as much as 300 lbs. do not sag the wire seriously.

Long straw, 4" deep, is used for bedding since finer material would fall through. It is found that it is necessary to change bedding only once every 7 to 14 days, and that calves lie on this floor about twice as much as they do on well-bedded concrete floors.

WATCH OUT for PUFFS and STRAINS when teams are soft—they may mean COSTLY LAY-UPS—

Shoulders sore, hocks puffed. Just the luck when there's work to do. But wise farmers use Absorbine at first sign of swelling.

Absorbine's action tends to speed up local circulation. This helps to wash out "muscle acid" that causes soreness and swelling. Congestion is reduced often within a few hours.

It is also used to relieve windgall, collar gall, fresh bog spavin and similar troubles. It will not blister or remove hair. \$2.50 a long-lasting bottle at all druggists, or postpaid, W. F. Young, Inc., Springfield, Mass.

Scene in Firestone's typical jungle in the New York World's Fair. Live, wild animals, many of which were captured by the Smithsonian-Firestone Expedition to Liberia, West Africa, are seen in this jungle. Among other features of the Firestone Exhibit is a tire factory and a typical American farmyard. A practical American farmer lives on this World's Fair farm and takes care of the stock.

RESEARCH FINDS NEW PRODUCTS

"Du Pont's Partnership with the Farmer" is the title of a new booklet just published by the E. I. Du PONT DE NEMOURS COMPANY, Wilmington, Delaware. It tells a fascinating story of new products which research has made available for the farm as well as the use of farm products in manufacturing many new products. Send your request to the Educational Agricultural News Letter, E. I. Du Pont De Nemours Company, Wilmington, Delaware.

ELECTROCUTES FLIES

At a cost of 10c a month for electric current, the Durobar Electric Fly Screen will finish off innumerable flies during the coming summer. These screens are installed in doors and windows of dairy barns or other farm buildings. As flies try to pass through the bars of the screen, which are spaced 9/32" apart, they cause a short circuit which electrocutes them. If you are interested in getting more information about these, write the DETJEN CORPORATION, 303 West 42nd St., New York City.

* * *

THE IMPORTANCE OF GRASS

"A Permanent Agriculture Built on Grass" is the title of a new bulletin published by the EDUCATIONAL AND RESEARCH BUREAU FOR BY-PRODUCT AMMONIA, 50 West Broad Street, Columbus, Ohio. For too many years we took grass for granted, and it is only recently that we have begun to realize its importance and to figure out what can be done to make grass lands more productive.

* * *

ADVERTISING LOWERS COSTS

Occasionally a man argues that advertising adds to the cost of the things he buys. Nothing is further from the truth. Volume production depends absolutely on advertising, and without volume production costs would be far higher on most of the things you buy. To build a few tractors, automobiles, refrigerators or radios would add greatly to the manufacturing cost of each unit. Advertising is the backbone of the American way of doing business, and it has been an enormous factor in creating a standard of living higher than in any other country in the world.

DR. SCHOLLES JOINS BEACON STAFF

On July 1, John Scholes joined the staff of BEACON MILLING COMPANY, Cayuga, New York, as a poultry specialist. He will do extension and research work under the direction of C. E. Lee, Vice-President of the company. Dr.

Scholes graduated from the University of Manitoba, Canada, in 1928; spent six years there as a poultry specialist; and entered the New York State College of Agriculture as a graduate student in 1935. He has taken out his first citizenship papers to become an American citizen.

* * *

"WHITE GOLD"

A ration, perfect in every respect except lacking in salt, would be disastrous. We speak of it sometimes as "common salt," but in their new booklet "White Gold for the Farmer's Profit," the INTERNATIONAL SALT COMPANY, Scranton, Pa., state that its proper use for livestock has an important place in any profit-making livestock enterprise. If you want the latest information, send for this bulletin.

* * *

NEW BOOK ON ENDING DUST AND WEEDS

A new booklet entitled "End Dust and Weeds", which should be of particular interest to those annoyed by dust rising from a tennis court, driveway, walk or similar unpaved area, has just been issued by the SOLVAY SALES CORPORATION.

This book explains what calcium chloride is—how it works—how it is used. It includes information on quantities to use per square yard of surface treated, and describes the advantages of the calcium chloride treatment for large as well as small areas. Full-page photographs illustrate the places where calcium chloride can be used. These range from paths to playgrounds, from parking spaces to roads.

Copies of this interesting book may be secured without charge or obligation by writing to Solvay Sales Corporation, 40 Rector Street, New York, N. Y.

* * *

PAINT FOR PROTECTION

We predict that more paint will be spread on farm buildings this summer than in any recent year. "What to Expect from White Lead Paint" is the title of a booklet published by the LEAD INDUSTRIES ASSOCIATION, 420 Lexington Ave., New York City. Read this book before you paint, and get a better job for your money.

SUFFOLK STALLION

W. E. REASONER & SONS of Watertown, N. Y., are the owners of a fine Suffolk Stallion, Sabarama Hawthorn No. 1734. This stallion twice won the championship at the New York State Fair, and his sire was Grand Champion at the Chicago Horse Show.

NEARBY MARKETS for NEARBY POULTRYMEN

Barred Rocks on Vermont Hills

By H. L. BAILEY

IF ALL the bars on a Barred Plymouth Rock were put end to end and then multiplied by 100,000—Well, it might be an interesting idea but very impractical, as Jimminy Cricket would put it. So without trying to divide the total mileage of black bands on blue feathers, let us say that Chamberlin Farms at West Brattleboro hatched approximately 127,000 Barred Rock chicks last year, wintered about 5,000 of breeding stock and are going along on the same, or a little larger, basis this year. They have hatches coming off every month. It is often dangerous to use the superlatives biggest or largest in connection with any particular line of endeavor, but if these two farms, which operate as a unit, do not constitute Vermont's largest poultry business they certainly rank in the highest brackets and they are unqualifiedly at the top in official directory of Vermont—U. S. Pullorum Clean flocks.

The Sunset Lake road leads off the Molly Stark Trail, Vermont's southernmost cross state route, just out of West

ways the buildings have been converted from general use to poultry raising.

Out back, where it gets full light from the southern exposure, is a poultry house over 100 feet long built in three sections, each at a different level, to conform to the sloping ground. Originally it was of one story, but just completed is a superimposed second story, one form of overhead which the owners believe will pay good dividends.

Wood Burning Brooders

Flanking the main buildings are the brooder houses of conventional type, but, and here is where the maple and beech woods in the background come in, the brooders are heated entirely by wood. "How often do they need firing up?" I asked. "Only once a day, except in coldest weather," was the reply, and if they have gotten through this last winter thus cheerfully it seems to speak well for wood. Only 250 chicks are allotted to a stove and the Chamberlins are convinced that the greater amount of room thus allowed each chick

Brattleboro. On it one may go, as he has a right to assume, to Sunset Lake and if he picks the right time of year he may continue through to Williamsville, a village in Windham County's shire town, Newfane. But if he is a poultryman at heart he may reach his goal of interest in very short order at any season, for there, secluded from the main line of travel but within easy distance, are the two Chamberlin farms. Pulling up the drive between big sugar maples one comes to the first of these, a typical old style New England hill-top farm—typical in general appearance, at least, with widespread mowings surrounding the set of buildings. It is not so typical when the buildings are inspected and one enters what may have been a carriage house in the old days to find a 20,000 capacity incubator at work. In other

The upper story has just been added to this hundred-foot house. House is built in sections to conform to sloping ground.

is well worth while. At 4 weeks of age the sexes are separated, using the wing color for determination.

Paradoxically enough, though you go up hill to get to the other farm, the plant there seems to be lower. This is because it sits below the road level in a small basin—scoop might be the better word in comparing the topography to kitchen ware—for with land rising sharply on all sides but one, it drops off with equal sharpness in that one direction. It is the real start off of one branch of the Whetstone Brook Valley.

Brook Put to Use

What has all this scenery to do with the raising of 127,000 chicks? Well, if

Water for all. Piped into these troughs from a brook at the head of the range, an ever-running supply is furnished the range.

you ever stopped to think of it — and you surely have if you are in the business — the amount of water which goes down the necks of such a number of birds on a warm summer day would make a pretty fair sized brook and its supply is frequently quite a problem for much smaller flocks, especially in flat country. But right here, tumbling down over a fall that would gladden the heart of a hydraulic engineer, comes the brook with enough water to supply the gurglings of a million birds and more. Not only is it there but the contour of the land is such that with only the simplest of engineering it may be carried down from the head-wall, so to speak, to supply the whole range. From iron pipes it is run into V shaped wooden troughs, old fashioned gutters, made by nailing two boards together, and thus there is fresh cool water galore for all birds to drink.

On this farm are a four-decker house and another of two stories, each approximately 50 by 20 feet. When I was there, the last week in April, they had begun putting the birds out on the range, but with still a little chill in the air and the remains of snow banks in shady places, very few had ventured away from the shelters. I should like to see that range, though, after a few warm days have started them in action.

The Chamberlins: M. E., the father, and T. D., H. G. and M. W., the sons, started breeding quality poultry in 1924 and since 1930 have devoted their attention entirely to Barred Plymouth Rocks. "Of course, you think they are the best breed, or you wouldn't stick to them exclusively," I remarked, and the answer was decidedly in the affirmative. They feel that Barred Rocks are the primary money making breed under average farm conditions, and it is to customers under such conditions that they especially cater. They sell largely in New England and nearby north-eastern states.

Starting with all Record of Performance stock, they have endeavored not only to maintain but to improve quality. One practice strictly adhered to is to see that every breeding male is from an egg of 26 ounces to the dozen weight and from a hen with an R.O.P. record of 200 eggs or better. Another is that they will not use outside eggs for hatching.

How We Keep Our Poultry Disease-Free

(Continued from Page 3)

that enter in. It takes several days to do the job thoroughly and allow the house to dry out, and in most cases it is impossible to shift the old hens around in order to make this possible.

The standard rule for cleaning laying houses on the Rice farm is to forget that chore just so long as the litter can be kept dry. Dropping boards are not used under the roosts. Instead there is a pit, screened by wire, into which the droppings fall, thus preventing the birds from coming in contact with them.

Very seldom is any stock purchased on the Egg and Apple Farm, but when and if purchases are made, they are kept isolated for about a month. A

few hens from the farm are put in the house with this stock. Again there is a definite reason for this. There is always a possibility that the purchased fowls are carriers of some disease which they do not show. If they are, it will show up in the stock from the farm that is put in with them. A special pair of rubbers is kept handy for the caretaker so that there is no possibility of picking up infection from this house and carrying it to the rest of the birds.

Spread of disease between members of the home flock is cut to a minimum by keeping close watch on all birds. Culling is a year-around proposition, and the boys feel definitely that sickness is avoided by picking out individuals whose vitality is not quite up to standard, while they are still healthy. If any birds do show signs of illness, they are killed and either burned or buried.

The sanitation program on the Egg and Apple Farm is not spectacular, but it is thorough. Its effectiveness is shown by the general good health of all of the birds on the place.

More Names of the First Class in Poultry Husbandry

On page 10 of the June 22 issue, we gave you the picture of the first short course in agriculture at Cornell, with the names of a few of the men in the picture. So far only a few additional names have come in, and many of them are only the last names.

Number 30 has been identified as Mr. Hall; 40, Mr. Scheuster; 18, Mr. Richardson of Fredericksburg, Virginia; and 35, Mr. Shepherd of Cicero, New York. A letter indicates that the name of 22 is either Mr. Hutton or Mr. Petty. Another letter indicates that George Watson, identified in the last issue as 8, is now living at Clyde, New York.

If any reader should know the first names of these men, or the names of any others in the picture, we ask you to write us. We are anxious to identify as many as possible of those who appeared.

Feed Consumption

What is the average amount of feed eaten by a producing hen in a year?

Obviously, the more eggs a hen lays, the more feed she needs to eat. High-producing birds will eat right around a hundred pounds of feed a year. Do not conclude, however, that inducing a poor hen to eat more feed will make her lay more eggs. Proper feed management of a flock of hens will enable them to lay all of the eggs that their inheritance allows them to produce; but the ability to produce a lot of eggs is an inherited characteristic.

"I just painted faces on the eggs with illuminating paint."

Vacations at HOME

WITH a little forethought and organization of space, materials and ideas, home can be one of the best places in the world to take a vacation — and not just a brief vacation, with a beginning and an end, but a long one with possibilities of moments or hours of enjoyment each day of the summer. Vacations are really a matter of spirit—not necessarily of place—and it is surprising to find how much fun and relaxation can be found right under one's nose, when you start to look for it and to plan for it.

One of the biggest home vacation helps is a living-room porch. In some old farmhouses where the family is not as large as it used to be, unused rooms have been converted into sunrooms or porches by adding more windows and screens. This provides a convenient, pleasant place for the tired man of the house to drop down at noon into a comfortable chair to read his paper or to get the latest market report over the radio. It also makes a grand "kitchen annex" when fitted up with a table or hinged shelf which can be used for meal-preparing jobs, such as hulling strawberries and shelling peas. Even darning socks can be a relaxation when seated in a comfortable chair on a screened porch, with a garden for a view and the birds for company.

If you already have such a porch, now is a good time to check it over and see if your family is using it to the fullest possible extent—and if not, why not. How about using it as an outdoor dining-room, particularly if your family is small? Perhaps your porch needs a few things added to make it comfortable: an easy chair, a couch or settee with rainproof cushions, adequate lighting so that it can be used on warm evenings. Perhaps it just needs screening, and this would be an investment in both health and pleasure.

If your porch lacks sun protection at the time of day when the family would be free to use it the most, get an inexpensive porch screen or awning. I know one family who made their porch doubly useful by improvising a canvas screen with a light pole at the bottom and a pulley at the side for raising and lowering it. This kept out both sun and rain, and cost very little. Later they added cupboards for storing games, and used the tops as shelves for pot plants.

Furniture for the porch does not need to be fancy. Often, old furniture brought down from the attic, and painted and doctored up to make it comfortable and attractive, will prove to be just the thing needed.

Another big home vacation help is the outdoor fireplace. These are becoming more and more a part of the home landscape and a home vacation center. They need not be expensive, though of course they range from a single grill balanced on stones to the most elaborate of chimneys and fireplaces. If there is a sturdy table with benches and some shade in the grouping, a fireplace will be used far more than if everything has to be lugged outdoors each time

by
MRS. GRACE WATKINS HUCKETT

a picnic is planned. Warm weather makes us lazy, so picnic accessories should be kept packed in a basket or box, making it a simple matter to transfer a meal or its makings to an outdoor fire-place or picnic grounds, or the beach, at a moment's notice.

Eating outdoors in summer is really a habit

This homemade outdoor fireplace is on the spacious lawn surrounding the farm home of Mr. and Mrs. F. H. Young, near Riverhead, New York. A privet hedge screens it from the road nearby, while shrubs and climbing roses add their beauty to the scene. A sturdy table and benches form part of the permanent equipment. It is easy to picnic here — or just sit!

worth cultivating. When properly organized, it saves work for mother, and is a relaxing and refreshing event for all, not to mention the effect that it has in sharpening appetites! The best way to picnic is to take what you have and go to some choice spot to eat it. From my own experience, I know how pleasant it is when a friend phones and says, "Let's eat outdoors. Bring what you have for supper and we'll take what we have."

Folding card tables and inexpensive deckchairs are almost indispensable to home vacationers. The card tables are so easily transported to a shady spot when you want to enjoy a meal in comfort outdoors; and gay deckchairs, if only to use in the shade alongside the house on a warm summer afternoon, invite one to take a few moments of relaxation. Incidentally, it's hard to beat the old-fashioned idea of summer comfort—a spreading shade tree on the lawn, with children's swings, a hammock, some comfortable chairs, and a supply of books and cooling drinks.

Games for the Family

Plans for vacationing at home should include some active sports if there are young people to be considered. A tennis court, croquet grounds, or the more active badminton, appeal to the young and vigorous. The boys, and possibly dad himself, will find any available spot good for ball playing. However, it is a good idea to reserve a special place for this sport, if you want to raise grass and flowers as well as boys.

It is easy to build up a collection of games, and it is a good trick to save some of the quiet ones for rainy days. Here are several improvised

games making use of commonplace household materials:

Ring the Nail: Drive large nails into one side of a vertical board, marking a different number in chalk under each nail. The game is to toss rubber jar rings over these nails. The player that rings the most points in a given number of throws wins.

Bottle Croquet: Set up pairs of bottles instead of croquet arches. Use stones or potatoes for balls and the foot for a mallet. The game is played like croquet but if a bottle is knocked down the player must go back to the beginning and start over again.

I See What I See: Lie down on the ground and start looking at various objects. One player describes what he sees while the other guesses what it is.

Ring the Bell: Hang an old auto tire from a tree and suspend a bell from the top of it so it swings almost in the center of the tire. Every player takes five stones and gets five chances to ring the bell. Every time the bell rings, it scores five points.

Indoor Horseshoes: Punch a clothespin through the top of each of two pasteboard boxes. Use jar rubbers for quoits—play as horseshoes.

Calendar Toss: Spread a large calendar with num-

bers at least 1½" high on the table or floor; toss milk bottle tops to land on the calendar. The number on which the top lands adds to the score of the player.

Judge the Bounce: Set a box or open umbrella at one side of a room and bounce rubber balls of different sizes and weights into it. The smaller the box the more skill it requires.

Gem Pan Polo: Cut cubes of wood at least an inch high and number the faces 0, 5, 10, 15, 20 and 25 respectively. Allow each player 6 blocks. The game is to toss them into gem pans set at a convenient distance from the players. The sides of the blocks landing uppermost make the score. In a large party, it is fun to divide the group into two teams and add the complete scores of all players on each side.

Roll 'em Home: Cut a slit in a pasteboard box. The slit should be about 1 inch wide and high enough for a round asbestos pad (the kind bound with tin) to roll through. Place the box on the floor, with slit in position so that players can try to roll the pads through it. If any player gets too good, move him further from the box.

Join the children in these games. You'll find they are fun and will add zest to the "home vacation." And join the children too when they go to the old swimming hole. There is something about even just wading in cool water on hot summer days that refreshes mind and body. At any rate, make up your mind to get as much fun as possible out of the home surroundings this summer.

A DOOR

By M. Lucille Ford

A door has such a luring way
Of coaxing you to go
Out in the happy, open ways
To wander to and fro.

And then it has a simple grace
When you would cease to roam
Of bidding you find rest and peace
Within the walls of home.

A colorful, yet economical, cooked vegetable salad may be made up in individual or family service, using green peas, diced carrots, beets or turnip and cauliflower flowerets grouped on cupped lettuce leaves. Vegetables are improved in flavor if allowed to stand at least 1 hr. in French dressing before using.

VEGETABLES for Vitamins

By AUNT JANET

SOMETIMES it is a problem to get children to eat all the raw carrots they need in order to get their full quota of vitamins, "A" especially. Here is a painless, even attractive way to manage it:

Raw Carrot Salad

1 package lemon-flavored gelatin
1 cup uncooked carrots, grated
1 cup apple, grated or 1 cup
grated pineapple, drained

Lettuce, watercress
or finely shredded
cabbage
Salad dressing

Prepare gelatine according to directions on package; if grated pineapple is used substitute the drained juice for an equal amount of the water required in the recipe. Chill until mixture begins to thicken. Add grated carrot and fruit, mix well and mold. Unmold and serve with mayonnaise or cooked salad dressing on greens.

When you have left-over vegetables, or just want to give the family a change, try some of these delicious vegetable casseroles:

Carrot Loaf

6 average carrots
1 onion
1 cup milk
2 eggs

1 cup cracker crumbs
3 tablespoons melted
butter
salt and pepper

Scrape carrots, peel onion and put through food chopper, using medium knife. Beat egg yolks, add milk, crumbs and vegetables, then melted butter, seasoning and lastly fold in stiffly beaten egg whites. Put into greased baking dish and bake in moderate oven (350° F.) for 45 minutes. Serve with cream sauce.

Spinach Loaf

1 cup cooked rice
1 cup chopped celery and
leaves
1/2 lb. pork sausage
1 teaspoon salt

Pepper
2 cups cooked spinach
1 medium onion, cut fine
1 egg
grated cheese

Mix in order given, place in casserole and cover with grated cheese. Bake in moderate oven (400° F.) for 30 minutes.

Scalloped Corn

1 cup corn
1 egg yolk
1 small green pepper
1/2 onion, finely chopped
1/4 cup milk

2 tablespoons butter
1 teaspoon salt
pepper
paprika
2 tablespoons flour
1 cup buttered bread or cracker crumbs

Chop pepper finely after seeds are removed, cook with onion and butter

for 5 min., stirring constantly. Blend in flour, salt, paprika and pepper and pour milk in gradually. Bring to boil, add corn, egg yolk and part of the buttered crumbs. Save the rest of the crumbs for topping. Turn mixture into buttered baking dish, top with remaining crumbs. Bake until crumbs are brown.

Scalloped Corn and Tomatoes

2 cups cooked tomatoes
2 cups corn
1 green pepper diced
1 small onion sliced
thin
1/4 cup grated cheese

2 teaspoons salt
pepper
2 cups bread or cracker
crumbs
3 tablespoons butter or meat
drippings

Simmer tomatoes in frying pan to reduce the juice. Add corn, green pepper, onion, salt and pepper. Simmer for another 15 min. Then arrange in alternate layers with the crumbs in a buttered casserole. Use 1/2 butter to dot each layer of crumbs. Sprinkle the top with the grated cheese. Bake in moderately hot oven 375° F. for 30 minutes.

Cauliflower Loaf

(4 servings)

1 lb. cooked cauliflower
3 tablespoons fat
3 tablespoons flour
1 cup milk

4 or 5 eggs, beaten
1/2 teaspoon salt
1/8 teaspoon pepper
paprika, celery salt
1 teaspoon minced onion or 1/2 tsp. onion juice

Cut cauliflower before or after cooking into flowerets or 2 or 3 in. pieces. Spread over bottom of greased casserole. Make a sauce of the fat, flour and milk. Cool. Then add eggs and seasonings and mix thoroughly. Pour over cauliflower. Set in pan of hot water and bake until custard is set in center, in oven 350° F. for about 1 hour.

Celery, broccoli, asparagus, peas or onion may be used instead of cauliflower.

Cold Luncheon Plate

For a colorful cold luncheon plate which may be prepared in advance, allow for each person two small slices of cold ham, 1/2 green pepper filled with potato salad, and a slice of canned jellied cranberry sauce in a lettuce cup. Top the cranberry sauce with a spoonful of cottage cheese and a dab of mayonnaise. Garnish with olive, pickles and radishes.

Jelly Champion tells why she insists on Certo

The "Tried and True"
Pectin that takes
the Guesswork
out of
Jelly-Making!

Mrs. Lucy Thomson, of Peoria, Illinois, who won 6 prizes at the Illinois State Fair for the jellies and jams she made with Certo. And here's how Mrs. Thomson made those prize-winning jams and jellies!

"I depend on Certo for perfect results," says Mrs. Thomson, "and Certo never lets me down. With Certo, even tricky fruits like strawberries and pineapple jell perfectly every time. In fact, my pineapple jelly, made with Certo, was a prize-winner for me at the Fair."

"Some women still think making jelly means hours of slaving over a hot stove—but they're wrong! Why, I boil my fruit mixture only 1/2 minute for jelly—only a minute or so for jam. And in less than 15 minutes after my fruit is prepared, I'm all through!

"It's always a satisfaction to me to see how much more jelly I get with Certo. Due to that short boil, no juice has a chance to boil away, so I average 11 glasses instead of 7 from only 4 cups of juice! That's half again more jelly—so you see Certo is a real money-saver!

"It stands to reason that jams and jellies made with Certo taste better—they're bound to! For that short boil doesn't let the flavor go off in steam... so jams and jellies have more of the real fresh fruit flavor. There's no 'boiled-down' taste, when you use Certo!"

CERTO 10-PIECE JELLY-MAKING KIT

\$2.00 VALUE FOR ONLY \$1.00

Here are the tools you've always wanted—aluminum colander of just the right size; enameled pitter; apple corer; wooden-handled aluminum measuring cup; 60 assorted jelly glass labels; long-handled wooden spoon; special cloth for straining juice; 1 dozen paper jelly glass covers, assorted colors. \$2.00 value—yours for only \$1.00 and a label from one bottle of Certo.

Look for the tested recipes under the label of every bottle of Certo—a product of General Foods.

Copyright, General Foods Corp., 1940

GENERAL FOODS, Battle Creek, Michigan

Enclosed is \$1.00 and a label from one bottle of Certo. Please send me the Certo Jelly-Making Kit (regular value \$2.00) which is described above.

We Farm by Ear

By Romeyn Berry

I GUESS we started farming too late in life ever to become scientific farmers. There are just too many kinds of bugs and too many different forms of poison to put on them; too many things that bees, or a south wind, can do to corn during the mating season to make it turn out funny; too many new machines coming on the market every week to make it possible for us at our time of life ever to scale the heights of scientific agriculture. We respect and envy scientific farmers, but realize that their ways can never be our ways.

We started too late. Ours must ever be a lowlier ambition and a humbler method. We must plod along in the middle of the marked road, and when we come to a blind turn, ask the way without shame.

But just because I'm talking in this bashful way, don't get the silly idea that our strawberries weren't something to brag about this year, or that we don't raise as much winter wheat to the acre as other folks up our road, or that we're taking any back talk from anybody about potatoes! It's methods I'm talking about—not results. The results are pretty good some years, in spite of the fact that we were never taught to read agricultural music, are too old to learn, and are therefore obliged to farm by ear.

The main difficulty with farming by ear and asking the way is that one gets so many conflicting and confusing directions. In self-defense we've pretty well settled down to three sources of information and advice: (1) the latest bulletin from the State College of Agriculture; (2) Liberty Hyde Bailey's "Cyclopedia of American Agriculture"; and (3) Elmer, who works for us and who, man and boy, has been farming hereabouts for upwards of 50 years. When all three authorities agree, we feel safe in going ahead on the basis of the joint suggestion. When they are at variance, we add up the conflicting advice, divide by three, and then fall back upon the *American Agriculturist*, as we do in every quandary, to tell us what to do with the

quotient.

The latest bulletin from the college speaks to us, of course, with all the authority of a voice from the burning bush; but not infrequently the bulletin assumes a larger farming operation than ours is, and the possession of machinery we haven't got.

The Bailey volumes were published in 1909, before the days of tractors, vitamins and Bang's disease. That makes them peculiarly applicable to our situation because we farm with hands and horses, as most folks did in 1909, and do not have any such modern blessings as tractors, vitamins and Bang's disease.

The third authority, Elmer, nicely combines a respectful attitude toward modern agricultural science with the possession of all the old-time rural skills and the reliable superstitions of old days. He takes a conservative middle ground half-way between College Bulletin 236 and the weather prophecies of Dr. Miles' Almanac and Hand Book. As a result, we're pretty apt to select only the best seed potatoes, treat them with every prophylactic recommended by the potato professor, fit and fertilize the soil with loving care, and then plant only in the dark of the moon.

That moon business may be nothing more than irritating superstition to the potato professor, but what's the sense of taking unnecessary chances? In this respect, we see eye to eye with the old Norse Vikings who, having been converted to Christianity and having enthusiastically accepted the doctrines of the new faith, nevertheless continued to slip around back of the barn now and then and sacrifice to Thor and Woden, just to be polite to everybody and play safe.

Take condition powders! We give them to the horses in the late winter and with happy results. The gray team seem to thrive on them, take up the spring tasks with gusto, and carry them on with astonishing endurance. Nevertheless, the College of Agriculture publishes no bulletin on condition powders, and they look at you askance if you ask for one.

Condition powders seem to go with sacrificing to Thor and with planting potatoes in the dark of the moon. Bailey refers to them, but doesn't commit himself. Elmer swears by them. I don't know what to think about condition powders for horses; but on the basis of what I've seen, I know darn well I'm going to take condition powders myself next winter in the hope they'll give me enough more speed and dash to keep me level with the gray team when the work starts.

Bugs and sprays constitute another field in which, with the best intentions, we can't quite keep up with science. We study and study, but we became completely discouraged when the wife of the apple professor told us the other day that she'd been living with that man twenty years now, come October, and about all she'd been able to pick up was that there were 236 kinds of apple ailments and 342 different sprays for them, and most of the sprays weren't any good unless you used them on the right days—Tuesday, perhaps, or the second Friday after the petals drop. It is our conclusion from this testimony (after talking it over with Elmer) that in the case of people like us, who are farming by ear, there is no sense in using a rifle when you can't see what you are shooting at and don't know the name of what you are hunting. So we have abandoned the rifle in favor of the blunderbuss method.

I mean we put a little of this and that and everything into the sprayer and duster, and blaze away regardless at apples, beans and potatoes every day or two. I'm not sure if it's the blunderbuss method that does the business or the grim look of determination on my wife's face when she strides forth to do battle with the cabbage worms that frightens them to death; but between the two our plants and trees manage to survive the aphids, the codling moth and the seven year itch and to produce good fruit at the proper time.

If we were specialists—truck gardeners, orchardists or dairy men—I suppose we could buckle to and learn our branch of the business scientifically and in its entirety. But being subsistence farmers, pledged to buying nothing whatever and raising a little of everything, the task seems hopelessly beyond us. Under such circumstances we're wise, perhaps, just to do the best we can and farm by ear. After all is said and done, the biggest factor in the success or failure of any given crop is the weather, and as a prognosticator of tempests or blue skies, we'll back the pains in Elmer's leg any day against either the U. S. Government or Dr. Miles' Almanac and Hand Book.

Anyway, we're doing the best we can in the farming business under conditions as we find them up our road; and all authorities agree—the College of Agriculture, Liberty Hyde Bailey and Elmer—that when a farmer is doing the best he can, angels can do no more.

Improvements at the State Fair

WHEN you attend the State Fair in Syracuse between August 25 and September 2, you will find a number of changes. In the Horticultural Building, the long rows of tables will be eliminated, and there will be approximately forty display booths, each devoted to a single mass group exhibit. Farm Bureaus, for example, will not attempt to display all of the fruits and products in the county but will concentrate on one product.

Niagara County will feature peaches; Ulster County, apples; Chemung County, poultry; St. Lawrence County, maple products; and Orleans County, plums and pears. Schuyler County will concentrate on small fruits, especially grapes; Lewis County, dairy and farm products; Wayne County, small fruits; Onondaga County, vegetables; Cayuga County, apples; Albany County, vegetables; and the Oswego County exhibit will consist of small fruits.

Also in the Horticultural Building

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Blue

Scarlet is a trumpet call
Summoning to strife;
It's flame and passion, battle—all
The stormy pride of life.
Green is quietness and peace
And joy of growing things,
Fidelity that shall not cease,
The calm of folded wings.

But blue, blue is the color for me!
The color of the mountain range, of
rivers and the sea;
The color of the summer sky that
arches fair and free,
The color of the sapphire, and of
chicory.
Blue has all the magic of horizons far,
The untrodden road across the hills, the
deeps beyond the bar.
Blue holds the mystery of the remotest
star,
And the harp-built cities where the
angels are.

—Dorothy A. Hurlbutt,
Hanover, N. H.

there will be a model farm garden.

A year ago the State Conservation Department exhibit was so popular that it will be expanded, and will present wild life scenes in winter dress.

Dr. Erl Bates of Cornell has been named by Director Paul Smith to the position of Museum Curator, and already a number of special exhibits are being prepared for the State Agricultural Museum.

Good Books to Read

WOLVES AGAINST THE MOON,

Julia Cooley Altrocchi.

The story starts on New Year's Eve, 1794, at a ball given for the aristocrats of gay Quebec. But the heir to the house, young Joseph Bailley, is longing to go adventuring in the wild Canadian "up-country". Along the trail of his change from gilded young aristocrat to hard-headed fur trader moves history itself, to the struggle for independence and democracy throughout the era of 1812.—The Macmillan Company, New York. \$2.75.

Good Movies to See

LILLIAN RUSSELL. A handsomely costumed biography of Lillian Russell, who flashed across the entertainment world in the Gay Nineties. Old songs and revues enliven a rather slow-moving story, which, however, offers pleasing entertainment.

The Song of the Lazy Farmer

MIRANDY works away and tries to keep ahead of them there flies, she swats and swats both night and morn, but flies just keep on bein' born so fast they keep ahead of her. I sit and hear her swatter whirr, a-knowin' that a dozen flies will take the place of one who dies, no matter how hard she may try, they hatch out faster than they die. Mankind is ruler of the earth, or thinks he is, and from his birth he tries to rule o'er all the land; the creatures move at his command, they fit themselves into his ways, he's lord of all that he surveys, he's master of all forms of life and boss of all except his wife.

That is, of all except the bugs, they bite his head and chew his rugs, them bugs make miserable his days in spite of swatters and of sprays. He thinks he's got a mighty brain, he thinks he's smarter twice again than all them bugs and yet the vim, at sight of them goes out of him. He's studied

'em and knows their ways and yet they put him in a daze, he knows the poison that will kill each bug as dead as can be, still the more he kills the more there are, them bugs are winnin' this here war with people and for all our fuss they'll rule the world instead of us, and beat us, with our flags all furled, while bugs are Fuhrers of the world; them bugs ain't as smart as you or I but they know how to multiply.

"We got the fertilizer from an ad in *American Agriculturist*."

Two Smart Frocks

COMBINE simplicity of style with cool-looking materials and you have the secret of smart summer styling.

FROCK PATTERN No. 3198 combines elegant simplicity with ease of construction. Make it from one of the real summer fabrics, figured or in plain black, the latter very smart with a pastel hat. Sizes 16 to 50. Size 36 requires $3\frac{3}{4}$ yards of 39-inch material for short-sleeved dress.

BALLERINA PLAYDRESS NO. 3257 has a tiny, tight waist and an extra wide skirt, both becoming and practical. Pattern for chic, useful bolero included. Sizes 10 to 20. Size 16 requires $3\frac{1}{2}$ yards of 39-inch material for dress; $1\frac{1}{4}$ yards for bolero. Pattern also includes "shortie" length version.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new summer fashion catalog.

Picnic Sandwiches

- 1 — Lettuce, ham and cranberry sauce.
- 2 — Two parts peanut butter, blended with one part cranberry sauce.
- 3 — Sliced chicken or chicken salad with a thin slice of cranberry sauce.
- 4 — Tuna fish blended with mayonnaise and topped with a slice of cranberry sauce.

Today in Aunt Janet's Garden

Daylilies Justify Themselves

I DO NOT like my readers to think I am "hipped" on the subject of daylilies, but last year's dry summer and the extreme cold of the past winter have reinforced my belief that they are among the very best possible choices for the home garden. They seem well able to take care of themselves in adverse conditions, are not fussy about soil, are not subject to diseases or pests, and can stand up for their own rights where weather is concerned.

Therefore this summer I expect to enjoy more than ever the succession of bloom which I worked out when I chose the varieties planted in our garden. Incidentally, these varieties include the old favorite lemon lily as a beginner; then follow in succession the newer hybrids up to the middle of August. Perhaps I shall eventually have a fall blooming one also. I even grew some daylilies from seed and I am expecting to get a thrill when they bloom for the first time this year.

The arborvitae which suffered so deeply from the winter will now be pruned, since the dead needles are ready to drop off and the new growth will hide the bare spots. In cases where leaders have become awkward looking, they will have to be cut back; otherwise a pinch-off job at the ends of branches will be their chief treatment. This helps to thicken the foliage at those points.

Speaking of pinching — hardy chrysanthemums and seedlings of annuals may well be pinched back to make them more branching. July 15th is

about as late as this should be undertaken, since buds begin to set very soon after that on the chrysanthemums. Usually I pinch them back two or three times during the season when the plants are 5 or 6 inches high.

Petunias and snapdragons are the two annuals which I pinch back, although there are many others which could be done with safety.

It is about time for me to grow some more new delphiniums, since most of my plants are now three years old. We are told by experts that four years is about as long as we should expect them to produce good clumps and spikes. As you doubtless know, delphinium seed should be planted as soon as they mature. They lose vitality upon standing.

It is also a good time to fertilize peonies; next year's bloom depends much upon the sort of treatment which they receive now.

It is sad but true that there are no satisfactory insecticides for rose bugs. The old method of drowning them in kerosene is as good as any.

Aunt Janet's Favorite Recipe

SOMETIMES we like to make our strawberries go further and yet not spoil their fresh deliciousness by so doing. Here is a simple recipe which answers that purpose nicely:

STRAWBERRY FLUFF

- | | |
|----------------------------|------------------------------|
| 1 cup sugar | 3 tablespoons tapioca |
| 1 quart fresh strawberries | $\frac{1}{4}$ teaspoon salt |
| hulled | 2 egg whites, stiffly beaten |

Add $\frac{3}{4}$ cup sugar to $\frac{1}{2}$ quart berries and let stand for 15 min. Then crush the berries. Measure the mixture into upper part of double boiler with enough water to make $2\frac{1}{2}$ cups liquid; then add tapioca and salt. Cook until tapioca is clear, about 15 min., stirring frequently; then cool. Save enough choice berries for garnishing. Cut the remainder in halves and sprinkle with the remaining $\frac{1}{4}$ cup sugar. When tapioca mixture is cool, fold in stiffly beaten egg whites and the halved berries. Garnish with whipped cream and whole berries. The proportions given serve six.

her permission to bring out a girl the following week. When she came, she was eight years old and I never shall forget her as she stood in the corner of the kitchen after the superintendent left, alone among strangers, a little bundle of clothes in her hand and 42 cents in her pocket. Our hearts went out to her in pity and love, and all thoughts of a boy were banished.

"We loved her dearly and she returned our affection. We sent her through high school; she later married a splendid young fellow that we think of as our son and everything has turned out happily, as I hope it shall do for 'Aching Heart.'"

We Took Two

An enthusiastic woman says to tell "Aching Heart" how she and her husband adopted two tiny babies. She says:

"Our boy is six and our girl will soon be five. While not related, they get along together beautifully.

"How we enjoy them! Our own lives have been so much happier since we took them into our home. I hate to admit it, but I am afraid we may have spoiled them. But they are good children."

A Temporary Arrangement

A woman, who hasn't adopted a child yet, has had the experience of having other people's children in her home. She feels that both she and her husband have benefitted much from the association. She says:

"About a year ago, a mother who was on relief asked me to keep her children for a short time. So we had a boy of five and two girls of six and seven, for four months. This proved to be a very delightful and satisfying experience. Just having the youngsters about added tremendously to our happiness. We do not have much in a material way, but we do have lots of nourishing food.

"These children were so eager to learn and there was so much that they needed to know, that the time was altogether too short. The taking of a child or children into the home temporarily is a good plan. I would suggest it for 'Aching Heart.' It might be the very step which would help her to win her husband over to her way of thinking, and also it might prove to be the way to find the very child which she would want to raise as her own."

Personal Problems

Readers Advise "Aching Heart"

EDITOR'S NOTE: In a recent issue, a letter was printed from "Aching Heart," a woman who wants to adopt a baby, but whose husband has lost enthusiasm for the idea. She wanted to know if she should break up her home, or if there might be some way to win him over. She invited the experiences of others. Here are a few of the fine responses which came in from "adopted mothers":

From Experience

"Dear Lucile: I feel qualified to answer 'Aching Heart' because at one time I was in the same situation. My husband and I were the same age as this couple — 32 and 37 — when I broached the subject of adopting a baby.

"He made me no answer of any kind, but I took for granted that if he were opposed to it, he would have definitely said so. So I cautiously began making plans towards the first steps of adopting a baby, and although he wasn't much help to me, he didn't actively oppose.

"I finally got a baby girl, and what a lovely girl she has turned out to be. My State is very strict about adopting, and particularly about placing with you the baby that will best fit into your home.

"Our daughter is a Freshman in high school this year and has won scholastic honors, of which we are both very proud. From the very beginning, my husband was very good to the baby. You can't help but love them, once they're in your home." — Contented.

We Gave Him a Chance

"A word to 'Aching Heart' who wants to adopt a baby. Don't wait until you are older. Adopt a baby now when you want him most and are able to keep up with the work he will create.

"We debated the question for three years. Then at the first opportunity we

IT IS EASIER to discuss a personal problem with an absolute stranger than with a friend, unless that friend be unusually intimate and understanding. If you have a problem, write to Lucile, Personal Problems Editor, American Agriculturist, Box 367, Ithaca, N. Y. Be sure to sign your name and give your address, as unsigned letters will not be answered. Names of all persons writing Lucile are kept entirely confidential, and if your letter is printed in these columns, your identity will be carefully disguised. Please enclose a self-addressed, stamped envelope if you wish a reply by mail.

took a brand new baby of whose history we knew nothing except by interview with the mother, noting her home surroundings and the doctor's certificate of health.

"My husband was not as enthused as I was over adopting a baby but he said, 'I'm agreeable as long as it makes you happy.' But he took a keen interest in the little fellow at once, helping me bathe and feed him and enjoy his day-by-day development.

"Our boy is now 11 years old and in Class A in school. We have told him he is adopted and he thinks nothing of it. We plan high and trade school training for him and we know he has the qualifications to become a good, honest, dependable citizen." — Mrs. J. B.

Adopted at Eight

"My husband and I passed through the same experience you are having, therefore I know how you feel. Perhaps there are many things your husband is considering; there are many to consider.

"Seventeen years ago we applied to an orphan's home for a boy. The superintendent happened to call while I was away from home and my husband gave

"Would you like two together, or are you married?"

Kernels, Screenings and Chaff

By H. E. BABCOCK.

I AM WRITING this on Sunday evening, June 23, in a hot stuffy hotel room in Denver, Colorado.

I don't feel a bit sorry for myself, however, for I have spent the day in an automobile along the Continental Divide, amid tremendous mountains, rocks and forests, lakes and glaciers. Some of the roads I have driven on have been open to traffic for only a week and are still lined by car-high banks of snow.

Tomorrow I fly up to Cheyenne, Wyoming, to look at a lot of Hereford cattle. By the middle of the week I hope to join Howard, Jr., in New Mexico. I haven't seen the place he is on since February. His "Down Mexico Way" reports have kept us all advised of his activities, but it is going to be much more interesting to see them on the ground than just to read about them.

I came out here to present my point of view on government subsidies to agriculture to a distinguished company in attendance at a Citizens' Conference on Government sponsored by the University of Denver.

Claude Wickard, Under Secretary of Agriculture, presented the Roosevelt Administration's case. We didn't agree very well but we had a good argument, got well acquainted, and spent a very pleasant day together. This is the way public policies should be determined in a democracy.

Farm Notes

By July first we shall be through filling silos. By that time we shall have four fourteen-foot tubs packed with grass silage.

The first grass we cut for silage, though very heavy, was quite immature. This silo has leaked considerably. We are going to be very much interested in seeing how good this early cut silage will be. One thing is certain, there will be a second cutting on our early cut fields ready to harvest almost before we are through with our first cutting hay.

* * *

Along with filling silos we have built up ever-normal haymows, mainly out of pasture clippings, in three outlying barns. We call these mows "ever-normal" because we do not plan on feeding them this winter but on carrying them over as reserves.

* * *

Our darkened basements for our Hereford heifers are working out fine now that flies are here. It did not take the heifers long to find this protection.

Incidentally, we keep plenty of loose salt in troughs in these basements and from the amount fifty heifers (which is about the number we run in a bunch) will eat, I really wonder if most pastured stock in the Northeast gets enough salt during hot weather.

* * *

This spring our surplus horses did not sell. We felt rather disappointed

but now that haying is in full swing, we have them all busy except two or three young ones which we would just as soon let grow out as work this summer.

* * *

Our February pullets are laying and will have to go into the laying pens soon. Because we lost money on the broilers and had to buy so much oil to keep them warm, they are pretty expensive birds. However, there are only six hundred of them. The bulk of the pullets we shall raise this year will be June and July hatched cross-breeds. We chose late hatching and heavies so we can get out of chickens on the Thanksgiving to Christmas market if we don't like egg and feed prices then. We aren't sorry we cleaned out most of our layers early this spring.

* * *

Our winter barley is maturing fast. It is not a good crop. For one thing, it hardly started last fall; for another, the land on which it is growing is poor.

* * *

This August we shall seed quite a lot of rye for fall pasture and to act as a nurse crop next spring for seedings of permanent pasture mixtures.

* * *

Has any reader of these notes ever disced in winter grain in the fall on a poor hay seeding? From some of the crops of volunteer grain which are springing up after combines, the idea seems to me to be worth considering as one way to insure a hay crop.

Down Mexico Way

By H. E. Babcock, Jr.

June 21, 1940.

ALL OF our second cutting alfalfa has been watered the second and last time before cutting, with the exception of the wheatland maize just planted. Our maize is all watered, and our cotton is now being watered.

Since a week ago Monday we have had ten cotton choppers working in our cotton and maize fields getting the weeds that the cultivators missed, and

thinning the cotton to eight inches apart. The work really progresses quite rapidly. The choppers are furnished with eight-inch hoes which take most of the thinking out of the job. The choppers strike once on either side of a plant and an eight-inch stand is left. The job naturally does not turn out as perfectly as this suggests, for the instructions are to leave two to three plants in a hill. On rich ground, a single plant, ten-inch stand would be ideal. On poorer ground, two plants to the hill will produce more cotton than a single plant.

Our geese have done a wonderful job cleaning up the Johnson grass in the cotton. At the present time, however, both the Johnson and the geese are a little discouraged, and it is open to question which will revive their interest first. The Johnson shoots which now try to grow are yellow and evidently lacking in nutrition and palatability. The geese, having lost interest in this kind of food, are staging a sit-down strike for some good wheatland maize. It seems a little cruel not to feed them, but the Johnson grass will get us in the end if we do not starve the geese to it.

We finished combining the first of our oats yesterday. These oats were sown originally for pasture and during the month of April they were grazed off practically bare to the ground. The little eight-acre piece yielded two hundred and eighty bushels of good heavy oats, and baled out three tons of straw. The 100-acre oat field will be started next week, as soon as we cut

the first of our second-cutting alfalfa.

Alfalfa cuttings are figured to come every forty to forty-five days, although on some larger farms where time is a factor, the alfalfa is cut every thirty-five days. This hay is generally watered twice between cuttings. In our own practice we put the last water on as near cutting time as possible. This leaves enough moisture to start the next growth which gets up enough to shade the ground and prevent evaporation of the first water after cutting. Where it is necessary to water immediately after the hay is cut, the ground dries out faster because of its lack of protection. Because of the low humidity and hot sun, we start our rakes less than half a day after the mowers. Large windrows are thrown up both to save the leaves and to save travel with the pick-up baler. With the horse-drawn baler with its own mounted power we can move at any speed. At no time are we dependent upon the speed of a tractor power take-off in picking up our hay. As a result, our baler travels less than half as far as the average power take-off powered pick-up baler.

Folks down here are naturally quite concerned about the European situation. However, they view with no more alarm a possible Atlantic Coast invasion than Northeasterners would a Mexican invasion. They are, however, quite concerned with reports of fifth column activities in Mexico. Outside of the national economic position, it is towards Mexico that we cast an apprehensive eye.

▲ This year we are repeating our experiment of making grass silage by mixing green winter grain in the dough stage with green clover and alfalfa mixed hay. On the ground by the chopper is a load of green wheat; on the truck ready to be dumped is a load of mixed hay. One man feeds wheat into the chopper, one hay. According to our experience last year the mixture makes perfect silage.

Normally, the three pieces of farm equipment shown in the picture below would be mounted on four pairs of wheels, each pair of a DIFFERENT SIZE. Here they are shown, however, all three mounted on interchangeable wheels, each wheel equipped with a second-hand 6.00 x 16 tire. In time we hope to have all the farm equipment we use at Sunnygables designed to use interchangeable, standardized wheels.

Why Pay First?

"About March first an ad appeared in a Syracuse paper which read something like this:

WANTED TO BUY: Farms between Binghamton and Syracuse. Rich Polish people wish to purchase farms, etc. Signed, Polish Editor, Scranton, Pa.

"We replied, describing our farm as best we could, but heard nothing until a week or ten days ago when we were surprised at milking time. A very large man with a small black moustache, and another one, smooth-shaven and speaking broken English, drove into our yard. They had a beautiful car but we failed to get the license number. This was their scheme: We could sell our farm at once if we would advance \$20. to have an ad translated to the Polish language, and when this was done we must advance \$10. more to pay for the ad which would be printed in the Polish paper. We thought it best not to do this, and they became very indignant and went away."

We never recommend dealing with a real estate agency from out of town, where an advance fee is required. There are any number of local real estate agents who expect their pay after the property is sold and not before. There is no guarantee that an advertisement like the one above will result in a sale.

* * *

Cows Across the Highway

"We live on a state road, and our cows must be driven across the state highway from pasture to barn. What precautions must we take to prevent having cows hit by motorists, and what does the law state concerning a cow's being hit?"

Cows or other livestock have no right on the highway without an attendant. On the other hand, they have a perfect right there when someone is looking after them. The New York State law does not require the putting up of signs to indicate that there is a cattle crossing, but a good many dairymen do so. It is a good idea.

The principal provision of the law

relative to cattle crossing the road is that motorists are required to slow down or stop on a signal from the man in attendance, and must exercise proper caution. When, under these conditions, a cow is hit and injured, the motorist is responsible for damage if he was traveling above the legal speed limit or if he did not obey signals or was negligent.

Under these conditions an insurance company will usually settle without question; but if the driver of the car is not insured, it is a question of collecting from him personally which, if he refuses to pay, means a civil suit for damages. The outcome of the suit depends on the circumstances of the case; namely, as to whether or not the owner of the cows observed proper precautions. Also, some form of negligence on the part of the driver of the car must be shown.

Practically, the turning of cattle across the road with the least possible risk means that two attendants are necessary, with special precautions in case the view of the crossing is obstructed so an approaching motorist cannot see the cows until he is very close to them. If unattended livestock are on the highway and are hit by a car, there is very little chance of collecting damages. In fact, there is a possibility, if the car is damaged or the driver injured, that the owner of the stock may face a suit for damages.

* * *

"Just One More"

"The printed receipt only called for a .50 deposit, but I paid him in full in order to get my magazine immediately. I was to receive the January issue."

This comment from a subscriber refers to a receipt for a magazine. Where such a receipt definitely calls for a PART PAYMENT never pay the agent the full amount. The part pay is the agent's commission and if you pay him in full and he neglects to turn in the money, naturally you will not get your magazine.

In this case our subscriber states that the agent said he was trying to get a college scholarship. This story is being told by hundreds of agents, and in most cases just isn't true. It is an appeal to the sympathies of the prospect and such an appeal in our opinion is poor salesmanship and poor sportsmanship.

We have heard of many cases where bus-loads of such agents have descended on a community and all of them regardless of age or previous training are working for college scholarships. Most of them need "just one more to win."

* * *

Expensive Autograph

A man came to the door of an acquaintance of mine last summer. He said he would like information for a book he was soon to publish about her family tree, and that he would greatly appreciate having her photograph and autograph.

She became interested immediately, and he gave her a blank paper which she autographed for him. In a few days she received a bill for a set of books for \$200. Of course she refused to accept the books and make the payment, and finally had to take it to court.—Mrs. C. R. S., Massachusetts.

"I am a widow and wish to find some lady about middle age who is unable to maintain a home without help. I will give her the opportunity to share my home in exchange for paying half the expenses. My home has all modern conveniences and is located in a small village."—Mrs. G. A. H., American Agriculturist Service Bureau, Box 367, Ithaca, N. Y.

Let Us Help You

THE following Home Service bulletins have been prepared by American Agriculturist's Home Editor, Mrs. Grace Watkins Hackett, and are available to any reader without cost other than 3c each to cover mailing and mimeographing costs:

- ☐ No. 1—OUTDOOR FIREPLACES. How to build them.
- ☐ No. 2—BLANKETS. Selecting, washing, and moth protection.
- ☐ No. 3—APPLE RECIPES. Your family will like these.
- ☐ No. 4—PROTECTIVE FOODS. Good health for the family.
- ☐ No. 6—HOME CANNING AND CURING OF MEATS. Directions are easy to follow.
- ☐ No. 7—CHOPPED MEAT RECIPES. Tasty, economical meat dishes.
- ☐ No. 8—BUYING A WASHING MACHINE.
- ☐ No. 9—TEMPTING WAYS TO SERVE EGGS. Excellent recipes for serving eggs as the "main dish" at any meal; also, egg salads and desserts.
- ☐ No. 10—HOMEMADE JAMS AND JELLIES. This bulletin will help you to have success with jams and jellies. Directions are easy to follow, and a number of Mrs. Hackett's famous recipes are given.
- ☐ No. 11—COOLING DRINKS. Recipes for delicious summer drinks.

How to order these bulletins: Check those you want, include 3c for each one desired, and return this coupon to American Agriculturist, Box 367-H, Ithaca, N. Y.

"Oh Oh... something's happened to his combine"

"There he goes to telephone... be somebody out to fix it in no time"

To save valuable hours in the busy season, use the telephone. To find the high dollar for what you have for sale, use the telephone. Keep your telephone on the job all the time—it's always ready to run an errand, exchange a bit of news.

BELL TELEPHONE SYSTEM

There's always a chance your earnings will be cut off. Will your family suffer? Have you provided for their future? Adequate protection is the surest way to safeguard their future. Your local Farmers and Traders representative will be glad to help you decide on a plan best suited to your needs. See him—or write us for booklet outlining our many policies.

THE G.L.F. PATRON

The basis of a sound business cooperative is voluntary use by fully informed patrons

Going Places

There is no magic that will make a 200-egg pullet out of a chick from 100-egg stock. The lively, sturdy pullets in the picture are well on their way to becoming profitable layers, because they started life as healthy chicks from high-producing parents, and their inherited ability is being brought out by proper care and feeding. It takes a lot more than a few batches of ingredients mixed together to make feed that will grow birds like these. It is the job of G.L.F. to develop the right kind of formula, based on public research and practical results, and to control the building of feeds so that they are uniform and do the feeding job intended . . . and do it at the lowest possible cost.

* * *

Flies in the House

After you've complied with all the good advice of the experts about removing manure piles and putting up screens, there are still flies hanging around the back door and sneaking in everytime anybody goes in or out. G.L.F. has spent a lot of time and research developing a Killing Fly Spray that really kills the flies. It doesn't smell bad, and as you see in the picture, the lady is able to use it around light-colored wood-work without staining.

The Dairy in Summer

July is a tough month for cows. Pastures are getting dry and flies are biting. Two things that help keep cows comfortable are illustrated by this picture—shade and water. A third thing that cows need, especially in summer, is salt. Everybody knows that, but often we just don't get around to providing for salt in the pasture. A salt block is the simplest way to provide salt in the pasture. It is well to offer the cows additional salt in the barn in case the cows don't get enough from the blocks.

* * *

Four-inch Lawn Mowers. A grazing cow takes a bite about four inches wide—which is like clipping grass with a four-inch lawn mower. And she has to handle about 100 pounds of grass a day if she is going to keep her weight up and produce milk besides.

That's too much to expect of any cow. During the early part of the season, home-grown grains will furnish the additional nutrients required; later on a mixed feed should be used to supply enough protein. If home-grown grain is not available, feed G.L.F. 18% or 20% feed to milkers giving over 20# daily at the rate of 1# of grain to 4# or 5# of milk.

* * *

Your Best Grain Market. There's no better place to sell home-grown grains than to put them through your own dry stock. Fall cows that are now dry or soon will be dry, will pay many times over for the grain they eat this summer.

* * *

Electric Fencing. In July, soil temperatures sometimes get so high that grass will not grow even when rainfall has been plentiful. This is where temporary pastures help to maintain milk flow. Sudan grass, oats, and peas, or early cut meadows may be cheaply and quickly fenced with one strand of barbed wire connected to a G.L.F. Electric Fence Controller. Be sure to use insulators on every post, stretch the wire tight between well-braced corner posts, and keep the wire about two-thirds as high as the stock to be enclosed. Line posts may be 50 feet apart. Fence lines should be kept clear of brush and grass to avoid grounding the fence in wet weather.

G.L.F. Electric Fence Controllers are safe to use and economical to operate. Both battery and combination types are available. Barbed wire is scarce and getting scarcer, so now is a good time to get acquainted with the electric fence.

* * *

We all enjoy a good horse race, but we won't pay much to see cows run. When the flies are biting on these hot days, G.L.F. Stock Spray will repel flies and keep cows quietly grazing and making milk. Regular use of G.L.F. Stock Spray will add to the comfort of both cows and milkers. Spraying in the morning keeps the flies away from the cows a good part of the day.

COOPERATIVE G.L.F. EXCHANGE, INC., ITHACA, N.Y.

A Simple Dusting Guide for the Home Garden*

All dusts except nicotine should be applied when plants are wet with dew or rain.

BEANS

Mexican Bean Beetle and Flea Beetle	¾% Rotenone	Weekly as soon as young beetle appears. Cover underside of leaves.
-------------------------------------	-------------	--

CABBAGE, CAULIFLOWER, KALE, BROCCOLI, BRUSSELS SPROUTS

Cabbage Worms	¾% Rotenone or Pyrocidine Dust 5	As soon as young worms appear. Repeat weekly as needed.
Cabbage Looper	Pyrocidine Dust 5	Weekly as soon as young worms appear
Cabbage Aphid	4% Nicotine	Apply when temperature is above 70°.

CORN

European Corn Borer	Dual Fixed Nicotine or 1% Rotenone Dust	First apply as eggs begin to hatch. Make three additional applications at 5-day intervals.
---------------------	---	--

CUCUMBERS, MELONS, PUMPKINS, SQUASH

Scab, Anthracnose, Bacterial Wilt, Leaf Spot, Macrorhizium Leaf Blight, Striped and Twelve-spotted Cucumber Beetle	6-10—Cucumber-Melon Dust	First apply soon after plants emerge. Repeat weekly, when leaves are wet with dew or rain.
Squash Bug	Pyrocidine Dust 5	Thoroughly cover colonies of young bugs whenever present.

POTATOES and EGG PLANT

Blight (early and late) Flea Beetle and Colorado Potato Beetle	60-20-20 Lime-Copper-Cal. Arsenate	When plants are 4-5 inches high. Repeat weekly for 7 to 10 weeks.
Leaf Hoppers and Flea Beetles	3-Way Dust	Hit under and over leaves as soon as insects appear. Repeat as necessary.

TOMATOES

Colorado Potato Beetle and Flea Beetle	¾% Rotenone	Dust at weekly intervals as soon as plants are established.
Blights and Leaf Diseases and Potato and Flea Beetle	Tomato-Potato Dust CGA6-CA20	Same as above.
Tomato Worm	¾% Rotenone Dust	As soon as worms appear.
Aphis	4% Nicotine	Apply as soon as aphis are present and repeat as necessary. Apply when temperature is 70° or above.

THE FARM PAPER OF THE NORTHEAST

Shall I Go to ... COLLEGE ?

By H. H. Whetzel

Professor of Plant Pathology at the
New York State College of Agriculture.

SHALL I go to college? That is a question which presents itself to every highschool student sometime during those four years of happy irresponsibility. Far, far too often the answer to this all important question is put aside for future consideration or left to Dad or Mother to decide. Fortunate the boy or girl who long before commencement day has himself definitely settled that question.

Shall I go to college? is a question which every young person, boy or girl, can and should answer for himself. Advice? Yes, from teachers, parents, older friends, but the decision should be yours. Advice is like medicine, good for what ails you, but often hard to take. And just in passing, let me point out that the advice of your schoolmates on this, as on most other matters of vital importance, isn't worth much. They are just as ignorant as you are.

Shall I go to college? Here I am a senior in highschool and I haven't decided. How can I know whether I should or should not go to college? Well, the answer is comparatively simple *if you can be honest with yourself*. If you're one of those many people who just can't face the facts, that eliminates you from further consideration. You are not worth wasting time on. You'd probably "bust" out anyway if you did go.

I'm talking now to the boys and girls who at your age can look themselves squarely in the face, examine themselves critically and give an honest verdict. Notice I didn't say a correct verdict. You may not know yourself very well, but unless you are crazy or a little bit "off" no other person is likely to know you better. Assuming that you are of sound mind, your honest judgment of yourself will be as nearly correct as is necessary in answering the question, "Shall I go to college?"

Come now, let's have your answers to the following questions. You are on the stand. Answer honestly and without reservations:

Do I *want* to go to college. If the answer is No, the decision on the main question is in. Pack your "traps" in the old suit case. Bid the folks goodbye. Grab the first job you meet and go after life and a living. You can always

living. If you can't earn a living with what you have now, it would be a waste of time and money for you to try to get through college. You may be a "dumb-bell", but don't be a fool.

If you are along in the middle of the class, just average you know, maybe you should or maybe you shouldn't go to college. Let's see.

Now you at the top and you at the middle, ask yourself, "What do I *want* to go to college for?" Come now, be honest about it!

To have a good time. Forget it. You can

Part of the Campus at Cornell University. Every one of the army of young men and women just graduated from high school should have the splendid advice about going to college given by Professor Whetzel in the article on this page. Read it and pass it on.

change your mind in favor of a college education later. A year or two working for a living won't do you any harm and besides it will be good for you.

If the answer is Yes, I *do* want to go to college, then answer this one.

Should I go to college? Well, that depends. Let's look at your highschool record. Where do you rate in this class of yours? Near the top, around the bottom, or about the middle? If you are near the top the evidence favors an affirmative answer, but it isn't conclusive. If you are near the bottom, if you just got by, the answer is plain. It's *No*. Don't trot out your "alibis". They are not worth consideration. Go to work and see if you can earn a

have just as good a time for a lot less money. If you're still a child and have to play, stay home and play in the nursery.

Because all the other kids are going. Well, in the first place they are not all really going to college. That's just talk. And what a reason! Everybody's doing it, so must I. Stay home a while and grow up. You'll get run over if you get out on the road now.

Because I want to be known as a college graduate. Huh! What an ambition! It's no great shucks being a college graduate anyway. They're two for a nickel at any employment office in the country today. Don't be silly.

Because I want to make a good living? That sounds better but it's a (Turn to Page 6)

Let's Talk Shop — Page 5; Pickles and Preserves — Page 18.

A MAN'S SIZE SILO— This silo, on the farm of W. D. Robens & Son of Poland, Herkimer County, New York, is 50 ft. high and 18 ft. in diameter, and will hold better than 300 tons of silage.

As you will see, the cutter is put into a depression and there is a platform so the grass doesn't have to be pitched up. Mr. Robens uses an ingenious device to dump the grass. Two ropes are laid on the bottom of the truck and hooked over the stakes in the front end. When the load arrives at the cutter, these ropes are hooked to a fence post handy by; and as the truck pulls away, the hay is dumped in a heap beside the cutter. At the left you will see a barrel. This contains phosphoric acid which is used as a preservative. This is the fourth year that grass silage has been put up on this farm.

Cauliflower Seed Imports Doubtful

How will the occupation of Denmark and Holland by Germany affect the supply of cauliflower seed for the 1941 crop? —F. W. D., New York.

ANY ANSWER to this question involves a lot of guessing and speculation. The United States has been growing in the neighborhood of 28,000 acres of cauliflower a year, much of it in the Northeast, and it is usually figured that it takes 1/4 lb. of seed per acre. Therefore, the annual requirements of the country are about 7,000 lbs. of cauliflower seed.

Men in the seed business are guessing that there is approximately enough

seed in the country to plant the 1941 crop, but there is no certainty that we will be able to import cauliflower seed from Denmark either for next year's crop or for succeeding years. We are told, however, that Long Island cauliflower growers already have sufficient seed for next year.

So far as we know, 100 per cent of the cauliflower seed has been imported in past years (it usually begins coming into this country about the first of December), but already there is a move under way by seed growers to grow seed in the southwestern part of the country. Cauliflower, of course, is a biennial. Therefore, growers who start producing seed this year will not have any for sale for next year's crop.

Cauliflower is not the only seed we have imported. It is estimated that about 1/2 our cabbage seed has been imported, and we know that a considerable amount of spinach seed has been shipped to this country from Holland. However, there is no doubt that we can grow all of the cabbage and spinach seed we need; and while the outlook

APPLE JUICE while you wait. This machine takes halved or quartered apples and turns them into apple juice right before your eyes. It is designed for installation at soda fountains, and is based on an idea that an advertising campaign can create a demand for fresh apple juice.

Early models of the machine revealed the need of some minor improvements. However, when it was demonstrated last spring at the meeting of the National Apple Institute, held in Rochester, it created much interest among apple growers. In this machine the apple pulp is expelled in the form of a thin ribbon.

Those who attended the meeting sampled the apple juice and found it very much to their liking. It was the general opinion that the development of this machine offers great possibilities as a means of increasing consumption of apples.

for growing cauliflower seed in this country is not so certain, we anticipate that sufficient seed will be produced to maintain our acreage. It is probable, however, that cauliflower seed is going to cost you somewhat more money.

We said at the beginning that any answer to the question involved a lot of speculation. It is possible, of course, that Europe's war will be over and that things will be more normal by a year from this time.

Cold Water Paint

A long time ago I read directions for making cold water paint. Now I can't find them. Could you give me this information?

YOU CAN BUY cold water paint in the form of a powder. All that is necessary is to mix it with water according to the directions. The basis of cold water paint is usually lime, with some material in it to make it stick and in some cases to give some gloss.

The National Lime Association publishes a bulletin called "Whitewash and Cold Water Paints." You can get a copy of this by writing to the As-

sociation at Washington, D. C.

Following is one good formula contained in this bulletin:—

Soak 5 pounds of casein in about 2 gallons of water (preferably hot) until thoroughly softened (about 2 hours). Dissolve 3 pounds of trisodium phosphate in about 1 gallon of water and add this solution to the casein. Allow this mixture to dissolve. Prepare a thick cream by mixing 50 pounds (1 sack) of hydrated lime in about 7 gallons of water, stirring vigorously. Dissolve 3 pints of formaldehyde in about 3 gallons of water.

When the lime paste and the casein solution are both thoroughly cool, slowly add the casein solution to the lime, stirring constantly. Just before using, slowly add the formaldehyde to the batch, stirring constantly and vigorously. Care must be taken not to add the formaldehyde too rapidly, as this may cause the casein to jell, thus spoiling the batch. The cold lime paste produced by carefully slaking and screening 38 pounds (1/2 bushel) of quicklime may be substituted for the hydrated lime if desired. Do not make up more of this formula than can be used in one day.

4-H FORESTRY CLUB— The picture above, from left to right, shows Robert Fullager, President of the Yates County 4-H Forestry Club; Harry Crans, Secretary, and County Club Agent Ernest J. Cole. Harry is showing Mr. Cole his scrap book on the trees he has been able to identify. Harry is starting his fourth year of forestry work which will include log scaling and timber estimating.

The Club was organized two years ago, and now has fifty members who are planting trees and caring for them. Meetings are held quarterly, and the program is always of interest to boys who have forestry projects.

A year ago Robert Fullager was selected as the boy who had the best forestry plantation in Yates County.

TWO KIDS— Myron Green of Eagleville, Connecticut, has quite a flock of goats. This is his son Newton Stedman Green. Judging from the pleased expression on Newton's face, this young goat has an interesting tale to unfold.

DAIRYING LEADS

Cash Farm Income From Major Farm Products
(Comparisons based on 1937)

MILK	(\$1,530,000,000)
CATTLE	(\$987,000,000)
HOGS	(\$902,000,000)
COTTON	(\$864,000,000)
WHEAT	(\$667,000,000)
CHICKENS & EGGS	(\$637,000,000)

THE above graph, published by courtesy of the Pacific Rural Press, emphasizes a point that I have been trying to make for years, which is that while we hear the most about wheat, it is one of the least important of our American farm enterprises. The value of milk and its products produced in America, for example, is pretty nearly 2 1/2 times the value of wheat. Cotton also is in the headlines constantly, because it receives so much attention from Department of Agriculture offi-

cials. Yet the value of milk is nearly twice that of cotton, and both cattle and hogs lead cotton.

Dairying is America's greatest farm business, and it represents more than one-half of the income of northeastern farmers. If you add together the value of milk, poultry products, fruit and vegetables—all major farm enterprises of the Northeast—you will see why New York, New England and New Jersey taken together comprise one of the greatest farm sections in the world.—E. R. E.

Your Questions Answered

How much corn silage will a silo hold that is 14 ft. in diameter and 32 ft. high?

A SILO with those dimensions will hold right around 100 tons of silage. It is relatively simple to figure the approximate capacity of any silo with the following rough rule:

Square the radius (that is, multiply it by itself); multiply the result by 3; multiply that result by the height of the silo. The resulting figure will be the approximate cubic feet in the silo. Multiply that figure by 40 lbs. (usually given as the average weight of a cubic foot of silage) to get the pounds of silage, and divide by 2,000 to get the tons. The answer won't be exactly accurate because the weight of a cubic foot of silage depends to some extent on the height of the silo.

Here, for example, is how it works out, using the figures you give. The radius is 7; squaring that will give 49; multiplying by 3 gives 147, the approximate area in square feet of the bottom of the silo; multiplying that by 32 gives 4,704 cu. ft.; multiplying that by 40 gives 188,160 lbs.; dividing that by 2,000 gives 94 tons, which, as you will see, is a little under the estimated capacity of 100 tons.

* * *

Controlling Thistles

Can you give me any suggestions on how to control Canadian thistles?

The Canadian thistle has been declared a noxious weed by the seed laws of 37 states. What makes it particularly "noxious" to most farmers is that it spreads both by seed and by running root stocks. It is classed as a biennial—that is, an individual plant does not live indefinitely as a perennial does. Therefore, it can be controlled by keeping the top cut or cultivated so that it does not form seeds. On large areas it appears that that is the most logical means of control.

Where there are small patches, it can be smothered out by covering the patches with heavy mulch paper, or it can be killed by the use of a weed killer. Sodium chlorate is recognized as one of the best weed killers because it does not permanently damage the soil, although it is probable that the area you treat will not grow a good crop for one year.

A good way to use sodium chlorate

Cultivating potatoes on the farm of Alvin Rynders near Cohocton, Steuben County, New York. The potatoes are just showing through, and the weeder teeth between the cultivator shovels take out the small weeds in the row. Mr. Rynders says he leaves it on until the potatoes get from 4" to 6" high. Later in the season the weeder is taken off and shovels put on to throw dirt up around the plants and cover weeds.

is to spread it on the land before the ground freezes in the fall at the rate of 200 to 300 lbs. to the acre. Sodium chlorate can be used as a spray, the principal objection being that when it dries it is very inflammable. In fact, if a person gets his clothing wet with it, a spark or a bit of fire is likely to set his clothing afire after it gets dry.

Castrating a Colt

Is it against the law in New York State to have a neighbor castrate a colt or other farm animals?

The law definitely states that no person who is not a licensed veterinarian can charge a fee for such an operation; but where the job is done for a neighbor as an accommodation, it is not illegal.

* * *

Ants in Raspberries

A year ago we found that our raspberries had been badly damaged by ants. Have you any suggestions that would help us to prevent the same trouble this summer? We enjoy *American Agriculturist* very much.

Professor Hartzell of the Geneva Experiment Station answered this question for our reader. He reports that ants ordinarily are not destructive to raspberry canes; but where they make ant hills in the rows, the hill dries out, robs the plant of moisture, and in that way causes injury. He suggests the use of tobacco dust or ground derris root in the hill, distributing it by stirring the soil to a depth of several inches.

To destroy ant hills in lawns or any place where valuable plants would not be injured, carbon bisulphide can be used. First use a stick to make a hole from 3" to 6" deep in the center of each ant hill, pour a teaspoonful of carbon bisulphide in each hole, and then close it by covering it with dirt and pressing it down with your foot. If the ant hill is unusually large, you may need a tablespoonful. Carbon bisulphide is inflammable and explosive when mixed with air, so keep lights and fires away from it.

* * *

Care of Metal Roofing

I bought some galvanized metal roofing. Some of it has been piled in the barn, and there are spots of a grayish material on the surface. Will this do any damage?

It certainly will. Galvanized roofing should be stored on end, preferably with something between each sheet separating them slightly, and should be inspected frequently. Where it lies flat, the metal collects moisture and electrolysis starts up, which results in a chemical change which destroys the zinc coating.

Baby Beef on a Dairy Farm

A VERY CASLER of Little Falls, Herkimer County, N. Y., who has a dairy herd of 47 head, of which 39 are milking cows, says he has more pasture than they need. To use this pasture in a way that would not add much to the labor needed, he purchased an Aberdeen Angus herd sire two years ago to cross with the cows of his Holstein herd from which he does not wish to save calves.

Out at pasture are ten yearling cross-bred Angus-Holstein yearlings which he intends to sell this fall. He estimates that they weigh 500 lbs. each now, that they will put on 200 lbs. more on pasture, and an additional 200 lbs. on grain in the fall. He plans to have them slaughtered in Utica and put in cold storage, and will sell them

Alice, a six-year-old Holstein cow in the herd of Frank Davy, St. Johnsville, Herkimer County, New York. She freshened March 30, and on three-times-a-day milking, averaged 80.6 lbs. of milk in June and 78.8 lbs. in May. Mr. Davy's herd of about 35 milkers averaged between 12,000 and 13,000 lbs. of milk last year. For a number of years Mr. Davy has milked part of the herd three times a day.

to local meat markets during the winter. Says he:

"I am pretty sure this will work out satisfactorily, although it might not be profitable to raise them this way if I were going to sell them wholesale. Anyway, I am planning to continue to raise about ten beef animals every year."

A Healthy Herd

THE HOLSTEIN herd of Angus Calman, Mohawk, Herkimer County, New York, has an unusual health record. About 1930 the herd was TB tested without a single reactor; in 1933 they were blood tested for abortion without a single reactor; and there have never been any reactors on any test.

Angus Calman

This is a herd of about 85 head, with some 45 to 50 milking cows. The reason for this unusual record, in Mr. Calman's opinion, is that there have been practically no purchases of cows for the past 30 years.

The one disease that has caused some trouble is mastitis, and Mr. Calman has been cooperating with the State College of Veterinary Medicine to control this difficulty. Once a year a man from the college examines all cows. This includes an examination of the udder and a brom thymol blue test of the milk of each quarter. Then the cows most seriously affected are

sold, and those which show any mastitis are moved to one end of the milking line and always milked last. After each milking, the teats of all cows are dipped in a solution of chlorin disinfectant. This program has greatly lessened the trouble from mastitis.

"Set Your Sights High"

THE CHIEF reason why Frank Totman of Cazenovia, N. Y., became a member of the Dairy Herd Improvement Association was to improve the average butterfat test of his Holstein herd. He has done that, and has also increased the production of his herd. For the first year, the fat test was considerably under 400 lbs. per cow. For the past year it was considerably better than 400 lbs., and Mr. Totman is now aiming at an average butterfat production of 500 lbs. per cow.

There are 170 acres on the Totman farm, with about 35 head of stock, 23 of which are milkers.

"When I joined the Dairy Herd Improvement Association," said Mr. Tot-

Mr. Totman holding his herd record books.

man, "I was strongly of the opinion that a cow was at her best from 5 to 7 years old and that after that she was ready for the discard. I have changed my ideas entirely on that score. I now have one cow that is 11 years old, and she is making one of the best records she ever made.

"I also found that I could feed more efficiently. We are now weighing the milk and feed and giving a 20 per cent protein ration to our cows at the rate of 1 lb. to 3½ lbs. of milk. For roughage they get alfalfa, mixed hay, and corn silage.

"—And even if he wasn't out, you can bet he is now."

**"When the grass is dry at morning light
Look for rain before the night,
When the dew is on the grass
Rain will never come to pass."**

—Old Country Saying.

Department of Agriculture Refuses Milk Price Hearing

ON JUNE 19, the Metropolitan Cooperative Milk Producers' Bargaining Agency of Syracuse filed a petition with the Federal Department of Agriculture in Washington to amend the present Federal milk marketing agreement to provide a minimum price of \$2.35 for Class I milk during the months of April, May, June, and July, and \$2.82 for the other eight months of the year.

In cooperation with the New York State Department of Agriculture and Markets, which was sympathetic, a committee representing the Bargaining Agency went to Washington to urge that the Department grant this Hearing, on the ground that milk production costs are increasing not only because of war times but because New York City Board of Health has increased costs by more regulations. Now comes word that Secretary Wallace has refused to grant the petition to call a Hearing on increased prices, stating that it is not necessary.

Even though Secretary Wallace and his associates in the Department of Agriculture may be convinced that price increases are not justified, it would have been fairer and more democratic had he granted the Hearing and allowed dairymen to present the facts on their side of the case. As a matter of fact, increased prices for next winter and spring are justified, and organized dairymen will have to take steps to see that they are increased in one way or another. I wonder how much the fine hand of Mayor LaGuardia of New York City was back of this failure of the Federal government to cooperate with dairymen?

This question illustrates again what I have said many times, that the safety of dairy farmers lies in their own strong organizations all working together. The Federal agreements are but a crutch which may be removed at any time, or which may become so bureaucratic and unfair in their administration that the dairymen themselves will have to kick them out.

We Can't Stand Both

ON THE FIRST day of July, many new Federal taxes were added to the already top-heavy burden of American taxpayers. These new taxes are necessary for national defense. More are to come. No one will object to paying them if they are spent wisely, but other government spending by local, State and National governments must be radically reduced. We, the people, must be aware of our own responsibility not to continue to ask the government for more and more service. Even our good public enterprises like education and roads must coast for a while and reduce expenses. It is no exaggeration to say that if we put the cost of defense on top of other present high government spending, there is nothing but ruin ahead for all.

Calfhood Vaccination is Effective

EVERY week brings more proof of the efficiency of calfhood vaccination in controlling Bang's Disease. If you have been baffled by this problem for years and have suffered great financial loss from it, as have thousands of other

dairymen, I suggest that you at least discuss calfhood vaccination with your county agricultural agent and a good veterinarian.

Bad for Bugs, Harmless to Humans

ONE OF the most interesting of recent discoveries is rotenone, a product from the roots of South American plants. Strange to say, rotenone, while it is poisonous to many lower forms of life, including insects and fish, is harmless to humans; therefore it is possible to prepare dust from roots containing rotenone, mix it with a carrier, and apply it to vegetables and fruits to kill bugs without any danger to the human who eats those products afterwards.

Here is another achievement of research scientists, without whom agriculture would soon be overrun with the bugs and diseases which multiply as farming grows older.

"I Want to Be Faithful"

*"Large was his bounty, and his soul sincere;
Heaven did a recompense as largely send:
He gave to misery all he had, a tear;
He gained from Heaven ('twas all he wished)
a friend."*

—Thomas Gray's Elegy.

YESTERDAY I attended the last rites for Mrs. Eastman's Uncle, Allen Rockefeller, who came the nearest to living a perfect life of anyone I have ever known. He was 84, the last of his family of seven, and of a generation which stood for something which seems to be rapidly passing from the world.

Outside of his little village, Uncle Allen was unknown. He sought not public office nor acclaim. As farmer and workman he earned his daily bread; his pride, his beloved wife and partner for more than fifty years, work well done, a garden that fruited before that of his neighbors, flowers to give away. His was a simple life, but great in all that matters, and greater than many of those who sit in high places, great because it had a theme, a keynote as deep and fundamental as life itself. That theme was Faith, so strong that nothing mattered, so unshakeable that even if it could not move mountains it could

change all the mountainous problems and sorrows of life to molehills.

Never in history has man had so many material things for which to be thankful as he has now. As Tennyson said, we are "heirs of all the ages, standing in the files of time." Yet in spite of this splendid inheritance, made possible for us by the sacrifice of our fathers, the world today faces chaos. We are unrestful, dissatisfied, destructive, unhappy. Why? Because we have lost what Uncle Allen had, Faith. We have lost faith first of all in our brother man, so that we no longer trust nor love him. We have lost faith in our own once-beloved America. Worst of all, we have lost faith in God and in His ultimate far-reaching Goodness.

But Uncle Allen had the faith of our fathers. Well do I remember him saying, in his quiet way: "I want to be faithful!" He was! When we are, the old world will be a different and better place in which to live.

Test Your Americanisms

THE AMERICAN pioneer added many new words and different meanings of old English words to our vocabulary. Because he was close to elemental nature, many of these Americanisms put new emphasis and meaning into the language. Following are 20 Americanisms, some of which are slangy but nevertheless salty and effective. See how many of them you can define in two or three words, then turn to Page 21 for the correct definitions. Allow yourself 5 points for every correct answer and check up on your knowledge of early American English. You ought to get a passing mark of at least 75%.

Eastman's Chestnut

PROBABLY few persons outside of Vermont know that Vermont was once an independent Republic. Back in those bad days near the close of the Revolution, and later under the Articles of Confederation, both New Hampshire and New York tried to claim territory that is now Vermont. But Vermonters, led by tough but brave old Ethan Allen and his Green Mountain Boys, thought otherwise and refused to be gobbled up either by New Hampshire or New York. When Congress refused to admit her to the Union, Vermont set up as a Republic and did a pretty good job of going it alone, until the Federal government thought better of it and admitted her as the 14th State in 1791.

Legion are the stories told of Ethan Allen, the man who took Fort Ticonderoga in the name of "The Great Jehovah and the Continental Congress." One time Ethan and a friend were fishing in Lake Champlain when the friend lost his powder horn overboard. "Oh, what shall I do?" he wailed. But Ethan, man of action, immediately plunged overboard after the powder horn. After several minutes, the friend became curious as to what had happened to Ethan and also dove overboard. When he got to the bottom he found Ethan down there trying to transfer the powder to his own horn! (Incidentally, if you like both history and good reading, get a copy of "Ethan Allen" by Stewart Holbrook, published by McMillan).

For over 56 years Mrs. Jane Onderdonk has taken care of this peony bed on her farm near Stanley, New York. She says the peonies are over 66 years old, and still going strong.

If you can beat that record for any perennial, tell me about it.

Let's Talk Shop

By E. R. Eastman

President of American Agriculturist.

IN 1922, eighteen years ago this summer, Henry Morgenthau, Jr., bought *American Agriculturist*. Shortly afterwards, Henry asked me to join him in the enterprise as the Editor. Fred W. Ohm, now Production Manager and superintendent of our printing plant, was already on the staff. We were soon joined by E. C. Weatherby as our new Circulation Manager; H. L. Cosline, Associate Editor;

E. R. Eastman.

Mrs. Grace Hockett, Home Editor; and by Irving W. Ingalls, Advertising Manager. It speaks well both for these people and for this great publication that they are still on the job, with the exception of Mr. Morgenthau who reluctantly had to sell the paper when he became Secretary of the United States Treasury.

When we took over the operation of *American Agriculturist* eighteen years ago, the paper had lost through mismanagement much of its former prestige. Its circulation had shrunk to 60,000 loyal old-guard subscribers, and the advertising revenue was discouragingly small. But *American Agriculturist* did have a record of honorable service to agriculture since 1842. It is the oldest farm paper in the United States still operating under the same name, serving its folks for 98 years. On that foundation we have rebuilt one of the most remarkable institutions serving farmers in the United States, and, what is also unique in the publishing business, we have succeeded in turning the actual ownership of this publication entirely over to its readers. Every dollar's worth of stock is owned and controlled by *American Agriculturist* Foundation, which in turn represents you, the subscribers to *American Agriculturist*. No individual and no corporation owns a cent of this publication, nor can anyone because of financial control dictate its policies.

Circulation—In these eighteen years, first under the ownership of Mr. Morgenthau and later under that of the Foundation, we have built this institution of yours into a very valuable property; and what is more important, we have built behind it influence and prestige that make it one of the most effective weapons the farmers of the Northeast have ever had for fighting their battles. Under the leadership and by the hard work of E. C. Weatherby and his associates in the Circulation Department, circulation of *American Agriculturist* has increased from 60,000 subscribers in 1922 to 190,000 net paid subscribers today, enthusiastic boosters of their own publication. Our press run is well over 200,000, going into every farm neighborhood and to nearly all of the farm homes of the entire Northeast. I never feel very far from home anywhere in the Northeast when I see those little yellow *American Agriculturist* Service Bureau signs, posted sometimes on every farm throughout an entire neighborhood.

Advertising—In advertising we have made equally great strides, to the point where in every recent year we have carried and are carrying more lineage than our chief competitors.

At Poughkeepsie, New York, we

own and have mostly paid for the building and costly equipment necessary to print *American Agriculturist* whose circulation is so large that it takes a carload of full mail sacks to move one issue.

I mention this progress briefly to give you some idea of the valuable property which you as a subscriber of *American Agriculturist* own, just as you own shares in any great cooperative organization of which you are a member.

But a machine, an organization, or an institution is of little value unless it gets results. So may I take you for a moment back across the last eighteen years to look at a few of the things that *American Agriculturist* has been able to do for you as a farm family in the Northeast:

Since 1922 we have worked on the editorial principle of being *FOR* good things instead of being "aginners."

Schools—As a farm boy, a long ways from a village, neighboring boys and girls and myself had great difficulty in getting a high school education, if we got one at all. So later when I had a chance, I used the power and prestige of *American Agriculturist* to get a Central School Act in New York State which would give country children equal educational opportunities with village and city kids. I take considerable pride in the fact that *American Agriculturist* had some part in making possible the central schools, of which there are now more than 250 in New York State.

Through our columns and personal work in the State capital, we helped to enlarge the State Aid for central and district schools and for roads, thus lightening the local taxes and making the cities pay, as they should, a larger share than formerly of the maintenance of schools and roads. We have constantly worked for lower taxes in New England, New York, New Jersey, and Pennsylvania.

Country Roads—For long years *American Agriculturist* has striven to get farmers out of the mud by working for inexpensive but hard roads to every good farm. Progress has been made. Larger State Aid, which we worked to secure, has helped.

Cooperative Movement—The historian will look upon the past twenty-five years as marking the rapid growth of cooperation among farmers. *American Agriculturist* has had a large part in this. We support the cooperative movement when it is sound at every opportunity. We believe there is an opportunity for both the cooperative and corporate forms of business, and we believe that either is preferable to so much government in business.

Milk Prices—Since I was a boy on a dairy farm, I have been tremendously concerned with the problem of getting better milk prices for farmers. *American Agriculturist* has supported every constructive effort and fight for such prices in both the New York and New England Milk Sheds. Some of you thought we were wrong when we urged the passage of the Rogers-Allen Law, the federation of more than half a hundred

milk marketing cooperatives into the Bargaining Agency, and when we helped to get federal marketing orders into the New York Milk Shed and to get better support for the ones in New England. Better milk prices is the answer to anyone who criticizes *American Agriculturist* for its milk marketing work. Even if the marketing agreements stopped tomorrow, they have been worthwhile for the good they have already done.

TB Campaign—Many of you will remember the great fight against cleaning up TB in dairy cattle. I personally went to Albany in the early 20's and worked with my legislative friends to get increased State appropriations for indemnities to dairymen, so that a farmer could get rid of his diseased cattle without losing his shirt in doing it.

Service Bureau—Those are just a few of the special fights *American Agriculturist* has been carrying on for you in recent years. But what of our regular work, the regular publication of a paper devoted entirely to your interests? What, for example, of our Service Bureau? It has collected thousands of dollars for farmers who otherwise would have been gypped out of it, a Service Bureau which puts crooks out of business, and puts the fear of God into the hearts of would-be crooks, with the result that there is not half the chicanery among those who deal with farmers that there was even a few years ago.

Crooks In Jail—What about our cash awards for crime detection? That Service Bureau sign which you post *MEANS* something. The crooked salesman, the man who would "put something over", has a healthy respect for the *American Agriculturist* Protective Service Bureau sign because he knows that back of it is an institution which will put him in jail if he doesn't watch his step.

Farm Tool—What about the regular editorial columns of *American Agriculturist*, with the latest and best in farm information boiled down, and made practical and interesting so that you can read and profit by it even when you are tired out. Time after time I have had farmers tell me that a single article in *American Agriculturist* had saved him the price of several years' subscription to the paper. Farm women repeatedly tell us that the *American Agriculturist* Home Department is the most interesting and practical in any publication.

How To Live—Perhaps best of all is the fact that *American Agriculturist* not only helps those who read it to make a living, but helps them to live. It gives those who follow it regularly a little lift of the spirit, and the Good Lord knows how we all need that in these bad days.

Your Friend—So we can say with pride, that *American Agriculturist* is not just a newspaper or a magazine; not even just another farm paper. It is all of these and more, much more. It is a living, breathing, personal force. It is your friend, backed by strong personalities, trained, experienced and determined to fight your battles to the finish. Its real power, however, comes from your support.

The American farmer, the American citizen, all of us, in fact, cannot have too many friends in these days, these days when we all face the gravest

crisis in history. Lincoln said at Gettysburg: "Now we are engaged in a great civil war to see whether this nation, or any nation so conceived and so dedicated, can long endure."

Think Straight—Today the crisis is much greater than it was when Lincoln gave his Gettysburg Address, for now nations are engaged in a great World War to see whether the principles of democracy for which the Anglo-Saxon has been fighting and sacrificing for a thousand years can long endure. These, then, are times when we need to keep our thinking straight. *American Agriculturist* does not want to dictate your thinking. We couldn't if we wanted to. But you need this institution as never before to put the unprejudiced, unvarnished facts before you so you can think for yourself. We of the staff pledge to do that.

In the crisis to come, food will be a determining factor. Much of the world will face starvation within a year. The production of food is your responsibility. Within a short time it will be evident that all of us will have to revise our scale of living to conform to conditions the like of which we have never seen. When the crisis comes, you will need *American Agriculturist* to help you as never before to produce food at lowest cost and make the needed changes and the hard adjustments that lie ahead for all of us.

Enemies—Most important of all is the fact that the principles of democracy which have made America great are challenged not only by enemies outside but the more dangerous ones within our own borders. Not all of these are confined to cities. They are to be found even in country neighborhoods, trying to influence farm organizations. They may be found within our own government institutions. Those who preach too much centralization and regimentation are enemies of true democracy. If they once get the power, you, the citizen, will never get it back. For nearly a hundred years *American Agriculturist*, in addition to its technical information about the farm and the home, has stood four-square to the world on the principles of true Americanism. We pledge you to continue to stand and to speak out without fear or favor against those, no matter who they are, who would restrict the opportunity and the rights guaranteed to every citizen by the Constitution.

Your Part—You can help your own publication, too. When in the market for anything needed for the farm or home, look through the advertising columns of your publication for suggestions. When you talk with your local farm dealer about purchasing something, tell him that you saw his company's advertisement in *American Agriculturist*. When you write for catalogs or information to one of our advertisers, always mention *American Agriculturist*. When your subscription expires, renew it. If your neighbor does not take it, suggest to him that he should.

I feel perfectly free in making these suggestions, because they are for the benefit of you and your fellow farmers throughout the Northeast. Every cent of profit from this publication beyond that needed for making a bigger and better *American Agriculturist* goes to the *American Agriculturist* Foundation, to be loaned to farm boys and girls of the Northeast to help them complete their education.

In conclusion, may I remind you again that this institution which we call *American Agriculturist* is yours. So far as we, your editorial staff, can find out what your wishes are, they will be carried out. In return, you are invited, urged, to write us your criticisms or opinions or suggestions. They will help us do a better job.

Help your work horses to help you

SALT IS ESSENTIAL to the diet of farm stock all year 'round, but it is especially necessary for work animals. From the first spring plowing to the last harvest, it is important that you provide your work animals with all of the good, pure, International salt they need. Their increased energy and power will more than repay you.

When horses work and sweat, you know they need water to replace moisture the system has lost. They need more salt, too, for sweat is full of salt exhausted from the system. Give working animals free access to International salt. They'll work harder and be healthier.

This is one of many ways International salt can earn more money at less cost than almost anything else bought for profit on the farm. If you want to know more about the profit in farm salt, write for International's book, "White Gold for the Farmer's Profit." It is full of advice backed by approval of the International Salt Research Department. Ask for International brands by name.

"Put Them On Ice"

By ED W. MITCHELL

THE banks have had to take over a good many large orchards because the carrying and maintenance charges of a big fruit farm are more than the average individual can stand when we get a succession of bad years.

What to do with them is just as much a problem for the bank as it is for the individual; in fact, more of a problem because one crop farming is always a gamble, and fruit farming is an expensive form of gambling. Banks are less given to speculation than individuals, and they are not set up to operate a farm economically.

One banker used the expression, "put them on ice", meaning, I suppose, to lay them away in moth balls till conditions get better or a buyer comes along. That can be done to a certain extent by doing without fertilizer, mowing instead of cultivating, discontinuing the expense of mulching and by cutting pruning and spraying down to the lowest point.

What will happen when someone

wants to get these trees back into heavy production again is another matter. Insect population builds up and disease infections get worse. Trees that are hard to keep clean, are almost impossible to clean up once they get thoroughly infested and infected. Trees that are in a nice balance of growth and production, are hard to regulate once growth is checked and then overstimulated. Any orchard that has been "kept on ice" any length of time, is apt to become a frozen asset, one out of which it will be hard to thaw any profit.

The interest, taxes and other fixed charges of carrying a fruit farm are such a large part of the costs of production that one might better go ahead and put a little more with it in the way of spray, fertilizer and general care in the hope, or on the chance of getting a crop, rather than to forfeit any chance of profit by just keeping the trees alive. The banks might better add their bit to whatever the grow-

Shall I Go to College ?

(Continued from Page 1)

delusion. You can make just as good a living without a college education. What do you suppose the income of the average college graduate is? Just about enough to get him in on the income tax. You don't have to go to college to get into that class.

I want to prepare myself for a profession. That's different. If you wish to be a lawyer, doctor, teacher, preacher, engineer, etc., a college education is in these days practically a prerequisite to these professions. Then there are a number of semi-professional callings for which a college education, while not required, is decidedly advantageous. Business, especially business executives; farming, especially for those who aspire to farm leadership; in art, literature, music and many other lines of work one's chances for success are greatly enhanced by an effective four years in college. In short, if you are determined to go into any field of endeavor where a college education is necessary or will greatly favor your chances for success, you need of course to go.

But don't deceive yourself with the idea that you will go to college just to get an education and then after you get it decide what you are going to do with it. You'll probably largely waste four good years of your life. Make up your mind what you want to be before you enter college. You can change your mind anytime while you are in college of course. But be heading for some goal before you start. The saddest spectacle to me is an able college student who doesn't know where he is going; doesn't know what it's all about; isn't interested in anything in particular, just drifting. He wastes the precious hours in trivialities and is likely to find himself a "total loss" the morning after commencement. There are far too many young folks today who blithely subscribe to the slogan "I don't know where I'm going but I'm on my way." Keep out of that procession.

But how am I to decide what I shall do or be? Nothing simpler — That which you now most desire to do or be.

Let no other consideration influence you, not even Dad or Mother. One can make a living and be reasonably successful at anything he really wants to do. If there is now nothing you would really like to do or be, don't go to college. Go to work at the first job you can find. There are plenty of things to do if you look for them. Don't ask Dad or the government to support you any longer. A year's experience in self-support will probably help you to make up your mind on the question of what you want to do or be. You'll still be plenty young enough to go to college.

Well, having decided for sound reasons that you should go to college, there still remain certain questions to be answered before the final decision is made.

Do I like to study? If the answer is No, don't go to college. If Yes, how well do you like to study? A wise old Frenchman once said "All wish to know, but few the price will pay."

Can you and will you put study first in your daily routine. Will you study first and play afterwards? Will you devote your chief energies and most of your waking hours to learning? Will

ers can scrape together and cooperate to keep these fruit farms up in condition and production than to try and lay them by waiting for better times.

One partial solution of the problem for either individuals or banks, is to cut out unprofitable trees and concentrate on those of an age and variety that offer some promise of profit and are growing more valuable instead of less valuable. This is a program that has been talked about for a great many years, but has not progressed very far in accomplishment.

It is not very hard to look over the books and tell what certain trees have cost and what their apples have returned. Most growers know the answer without even looking at the books. What we need is a little more prodding to get our courage to the sticking point and really cut down some of these unprofitable trees. Maybe these hard times will do it.

One other practical help is to thin off poor apples early in the season. It is less painful to throw them away now than when they get as far as the packing table, and certainly, they no longer have a place on the fresh fruit market.

I hope the use of apples for silage, and the use of apple pomace for cow feed will be developed and promoted more rapidly. It is one way to use up large quantities at low handling cost and price, two features that are basic to handling a large volume of any by-product. We are undoubtedly going to see a battle to get profits out of apple orchards, and we might as well start preparing now, or the apple growers "will be on ice" instead of the orchards.

you work for yourself or are you one of that great majority of college students who "work for the professor." In short, are you prepared to pay the price of devotion to a real college education? If you can honestly answer these questions in the affirmative, I think you may safely embark upon the tide that carries thousands of high-school seniors to colleges and universities each autumn.

But hold, you say, *How am I to go to college?* I have no money and my parents can't afford to send me. How fortunate! Now you are the young person who will really get a college education. If you want it badly enough to work for it, the solution of your problem is simple. Any boy or girl of more than average ability can work his way through college without sacrificing anything worthwhile. I know, because I did it and because I've been seeing boys and girls do it regularly for more than thirty years.

If you really want to go to college, and if you are sure you are one of those who should go, don't let the lack of ready cash deter you. Pick your college, pack your grip and go!

"Maw, don't yuh think it's about time to wean lil' Wilbur?"

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of De-meter of the National Grange.

HOW FREQUENTLY leaders in the Grange are called to important civic tasks is a striking commentary on the prestige of the fraternity, as well as the degree of public confidence felt in the men who head up the organization. Two recent illustrations prove this point:

One comes from Maine, where State Master F. Ardine Richardson has now been named by Governor Lewis O. Barrows as a member of the joint commission appointed to probe all the departments at the State House, this task having been made necessary by recent financial disclosures in Maine administration which are most disconcerting. It will be a full summer's job, with close attention to its confusing details, and State Master Richardson is going to be hard pressed to "divide himself" among his multiple duties. Previously Mr. Richardson had been named by Chief Justice Barnes of the State Supreme Court as chairman of a nine-member wage board, which has had many knotty problems to solve.

In New Hampshire State Master William J. Neal was selected to head up the New Hampshire Electric Co-

operative, Inc., which has had in charge the extension of rural electrification in the Granite State, and a tremendous task has already been accomplished under State Master Neal's leadership. New Hampshire Grange members by the hundreds have signed up in local cooperatives and have lent every possible assistance to REA projects. In many instances local Grange leaders have given freely of time and cars to canvass the vicinity and in consequence have been able to obtain sufficient signers to insure many projects that would otherwise have been impossible. All this work comes under the REA, and in no state has there been a heartier response to its possibilities than in New Hampshire.

AT THE 60TH ANNIVERSARY of Webster Grange in New York State, just celebrated, a remarkable fact was the presence of one of the charter members, Mary Spencer, while another original signer, E. C. Warner, is still living but was unable to come. Webster is not only among the veteran Granges of the Empire State, but it has the largest membership of any subordinate in the United States, the present roll including more than 1,000 Patrons, augmented by the recent initiation of a good-sized class. The Juvenile branch of Webster Grange, meeting in a hall of its own recently provided, is also a very active group.

ORANGE COUNTY POMONA, No. 10, in Vermont, is conducting a series of one-act plays, with the eight subordinate Granges in the district competing. The entire proceeds are to be used for sending to the New England Lecturers' Conference at Burlington in August all the subordinate lecturers within this

Pomona jurisdiction. The financial results of the contests have been very satisfactory, and when the roll is called at Burlington, every lecturer in the district will happily respond.

AT THE MOTHER'S DAY celebration of Hillstown Grange in Connecticut all were happy to greet the oldest mother of that subordinate, Mrs. Laura Brewer, 88 years old, to whom was presented a beautiful gift of flowers. Mrs. Brewer was the first woman to occupy the master's chair in Hillstown Grange, and her husband was its first master.

INDIAN RIVER GRANGE, No. 73, at Milford, Connecticut, varied its usual Children's Night program by inviting as special guests all the babies of Grange families, and the little tots were induced to do many stunts on the program—also doing some NOT on the program! Three of the little folks were eight months old, eight were two years old and one had actually reached the ripe old age of three! Many more babies would have been present had not a heavy thundershower just at meeting time interfered with their coming. There was a large attendance of Grange members that night and the evening's events were of decidedly novel character.

ANDOVER GRANGE in Connecticut enjoys, so far as known, a distinction possessed by no other in the United States: In having the only Home Economics committee composed exclusively of Grange brothers. Four of the latter comprise that committee this year and have set out to "show 'em" what can be done in practical service lines in that community. These committee

members all wear appropriate badges at the meetings and between times are laying their plans for 1940 activities.

IT IS WORTHY of note that five states in the Northeastern area are now presided over by Grange Governors—Lewis O. Barrows in Maine, George D. Aiken in Vermont, Leverett Saltonstall in Massachusetts, Raymond E. Baldwin in Connecticut and A. Harry Moore in New Jersey.

ONE OF THE youngest Grange lecturers in the state of New York is the proud possession of Springville Grange, No. 1136, in Erie county, where Miss Lulu Bobseine, who has just passed her 18th birthday, is proving one of the most efficient program leaders among the subordinates of the Empire State. She was graduated last year from the Springville High School and has exhibited energetic leadership among the young people of the community, especially enlisting their endeavors in Grange activities, which they are finding splendid training for the development of their best selves.

THIS YEAR'S youngest Grange officer in New Hampshire, so far as "discovered," is the Worthy Ceres of Olive Branch Grange at Hebron, Miss Hazel Adams. She joined the Grange in March last year, just as soon as she was 14 years old, and in January of this year, before she reached her 15th birthday, she was elected and installed to the station of Ceres.

STATE MASTER W. J. Rich of New York announces that a goal of 6,000 candidates has been set for the series of a dozen or more special sessions of

Profitable PARTNERS in Your CORN HARVEST

MCCORMICK-DEERING Corn Binders and Ensilage Cutters are designed and built to reduce your corn harvest costs. They will save time when a delay of a day or two may mean lower feeding value. They will do excellent work for you because Harvester workmanship is built into every part and feature.

McCormick-Deering Husker-Shredders and Ensilage Harvesters round out a complete line of corn machines. The husker-shredder is a modern all-steel machine with a capacity of 400 to 700 bushels a day, depending upon conditions, and can be operated by any two-plow tractor. The ensilage harvester is a time and labor-saver, making ensilage in the field in one operation.

Stop in and see the International Harvester dealer now. Place your order well ahead of the rush season. Choose McCormick-Deering and count on smooth sailing during corn harvest.

INTERNATIONAL HARVESTER COMPANY

(INCORPORATED)

180 North Michigan Avenue

Chicago, Illinois

Long life, dependable service, and easy operation make the 1-row McCormick-Deering Ground-Drive Corn Binder a favorite among horse farmers. The vertical-type shown at left is a popular model. A short-type binder for short varieties of corn is also available.

Above: McCormick-Deering 2-Row Power-Drive Corn Binder. Built for heavy work and fast cutting at tractor speeds. One-row models also available in regular and short corn types. Capacities: 8 to 10 and 20 to 25 acres a day.

Left: You have a choice of two McCormick-Deering Enclosed-Gear Ensilage Cutters—No. 10-E, with capacity of 8 to 10 tons an hour, and the larger No. 12-E, with capacity of 10 to 16 tons an hour. The No. 12-H Hay Chopper, in addition to making grass silage, can handle corn efficiently.

McCORMICK-DEERING

Corn Binders • Ensilage Cutters

DEMOCRACY at Work

By ARTHUR DEERING,

Dean, Maine State College of Agriculture.

TALK about Democracy at Work! Well, Dean Ladd of Cornell and I actually saw this miracle recently. You can't guess where; it was the last place in the world most people would expect to find this phenomenon. It was at a convention of lenders and borrowers. No, not exactly bankers yet they were carrying on the functions of a bank—loaning and collecting money. There were the President, the Vice President, the Directors and Stockholders. Yet no spats, no white pants and golf clubs, all were dressed as regular guys with a job to do and ready to do it.

Enough riddle guessing. What I want to describe is a district conference of Production Credit officials and P. C. A. directors meeting for two days at Lakewood, Maine. This one agency of the Farm Credit Administration is loaning more than \$11,000,000 annually for production purposes to the farmers of the eight northeastern states.

This conference was attended by the Corporation officers in Springfield and by the directors of six of the seven credit associations in Maine—similar, I expect, to other conferences held throughout the Northeast.

Now the thing that impressed one was the procedure followed at the conference. In the first place, there were no lazy seats, big, fat overstuffed chairs. The group was arranged around tables. Every man was in his chair at the proper time or the Sergeant-at-arms collected a ten-cent fine from him, were he late. No one made a speech, one rule only was followed, namely, one question at a time and discussion by all.

The next thing that impressed one was the manner in which the program was organized, in part at least. The 30 farmer-directors, each a borrower, held an executive session at the suggestion of the Corporation officials.

At this session they decided upon the questions they wanted to discuss with the officers and elected their own chairman and secretary to preside at the conference.

At the joint session following, the questions agreed upon were presented and those directors interested discussed the merits of each pro and con. Often they would come to an agreement without the Corporation officials taking part in the proceedings. Occasionally "Hi" Munger, President of the Corporation, would enter the discussion to clear up a point here and there.

At one place he picked up the ball about like this, "Now let's see men, I wonder if there's any difference after all between your views and our views. You say you want to make more unsecured loans to good borrowers who have plenty of security. Well, why don't you? We Corporation officials want more of that kind of business."

It was in just such manner as this that problems were settled. One might think "Hi" Munger was the granddaddy of the F. C. A. instead of one of the four members of the family. Let some one bring up a question involving the Federal Land Bank or one of the other three units, and you'd see "Hi" present the case of the absent member so fairly that a common agreement as to policy would be reached and the best of good will toward the other unit maintained.

Such men are rare and priceless.

Not once during these two days did I hear an official make that trite and thread-bare remark — "I agree, but 'Washington' won't allow us to do it!"

A real test of this policy and spirit of working together came up when the five associations in Aroostook County discussed this question, "Shall these associations develop their own loaning policies or shall they agree upon common policies for the County?"

If you stop to consider the various

factors involved you'll catch the interest aroused by the discussion and the importance of the decision reached.

Here are five associations in one county; all started the same year, all needing an increased volume of good loans, each with definite possibilities of success once prejudice can be overcome. However, when one considers the different conditions found in northern, central, and southern Aroostook, added emphasis is given to the argument that there should be different loaning policies for each area. On the other hand, the three associations forming a triangle in the center of the County, each only twelve miles from the other two, present the need for uniform policies, here at least.

But to get back to the spirit of this

American Agriculturist, July 20, 1940

conference. Who decided the questions? Was it referred to Washington? Did the Corporation officials pound the table and proclaim the procedure that must be followed? No—the 25 directors of these five associations agreed that their loaning policies should all be the same and they expect the Corporation will see to it that such is carried out.

No wonder then, is it, that when such a spirit of cooperation and fair play exists that directors and farmers are heard talking about "our" association, "our" credit agency, "our" loaning policies, for these men have got more than a few dollars tied up in Class B stock—their interests, their decision, their loyalties are all interwoven in "their" credit agency.

Seneca County, N. Y., Grape Growers Run Their Own Marketing Deal

By W. E. WASHBON

FOR NEARLY 10 years Concord grape growers in the Seneca Lake area have suffered from a slowly contracting fresh fruit market. In some years the price received was \$10 to \$15 per ton less than in the Chautauqua-Erie grape belt. There were no processing plants in the area for turning the crop into grape juice and the only market other than this slowly dwindling fresh fruit market was at Hammondsport and Naples from 30 to 100 miles from the grower. They usually purchased only when production in the Keuka and Canandaigua Lake areas was insufficient to meet their needs. Yes, the prospects for grape growers was at low ebb with an average price of \$18 per ton in 1937 and \$25 in 1938 when accurate accounts show that a profit cannot be expected for grapes selling for less than \$40 per ton.

The county agents, Richard Pringle of Seneca County, William Allen of

Yates County, and W. E. Washbon of Schuyler County, realizing that the situation was serious and that the growers were at a point where they would work together and sacrifice to create a market, called together a group of leading growers and put the proposition up to them. They decided that a cooperative grape juice plant was needed to take care of at least 1000 tons of grapes that were each year depressing the market.

A grape juice processor was hired to survey the cost of a plant which would handle that many grapes. His report said \$54,000. You're right, \$54,000 is a lot of money, but the growers decided they might as well die owing a little more money as to starve slowly into a certain death.

If any of you think it is easy to raise

\$20,000 among 60 growers that haven't any money, if you think it is easy to set up an organization that looks as if it couldn't fail, and convince growers, bankers, and local business men of this, you should try it sometime.

For weeks an organization committee made up of Don Wickham, Ely Wickham, C. H. Beattie, and George Tichenor of Schuyler County, Ed Beers of Yates County, and Byram Leonard, Jack Mulford and Gordon Lambert of Seneca County, traveled from grower to grower talking about this way to create a market where none existed before. They had to convince growers it was good business to borrow or invest \$20 for each ton of grapes they wished to put through the plant annually. In some years that was more than the market price. However, the Finger Lakes Fruit Products Cooperative, Inc., of Watkins Glen, became a reality on June 19, 1939.

On July 1, 1939, the boards were taken from the windows of the old Brobar plant in Watkins Glen, a 3 story steel framed brick building which was built for a grape juice plant but had not been used in 18 years. The last of the pressing equipment was installed on September 28 and the first ton was pressed on October 2, 1939.

A loan for about one-half of the \$60,000 necessary to put the plant in operation and process the juice was obtained from the Bank of Cooperatives of Springfield, Massachusetts. The Farm Bureaus of the three counties involved financed the early organization costs and helped the organization committee throughout the period of organization besides contacting many interested growers.

The juice is being sold through the sales organization of the Westfield Planters Cooperative at Westfield, New York, the second largest processors of grape juice in the world. The quality is very good and apparently attracts the market.

Practically all of the juice from last fall's crop has been sold, some of it under the grower's own "Watkins Glen" Brand, but not all of it has been delivered. The juice was pressed out last fall and stored in barrels at a very low temperature. This allowed the solids to settle out, and just before it is delivered it is pasteurized and bottled.

The growers have already received \$20.00 per ton in cash plus a \$5.00 per ton note representing cash used to purchase bottling equipment. It is expected that the final returns to growers will be between \$25.00 and \$30.00 per ton. Because the equipment is being used just about to capacity the Association is not seeking new members at the present time.

The Board of Directors performed an excellent job in getting the plant set up in four months with a very mini-

Caught by a CAMERA

Twenty-one and the berries! That's Rachel E. Hatfield of South Quaker Road, Gowanda, N. Y., who on her 21st birthday recently feasted on a quart jar of Columbian raspberries her mother canned the year Rachel was born. They were the "berries" according to auburn-haired Rachel. In fact, they tasted just as good as though they had been put up only last fall. Canning is one way to "stretch" the garden season and to get more of the living from the farm. Try it.

Young George LaMont adopted this lamb, but on occasion he needs a little help from Tom. During the winter Tom is a member of the staff of the Department of Agricultural Economics and Farm Management at Cornell, and spends his summers working on the home farm at Albion, New York.

THE LEAGUE STANDS FOR THE AMERICAN WAY

**"GOD GRANTS LIBERTY
ONLY TO THOSE WHO
LOVE IT...AND ARE
ALWAYS READY TO
GUARD AND DEFEND IT"**

Daniel Webster

FOUR GENERATIONS *have tilled this farm for 100 YEARS*

"My family has lived on the same Allegany County farm for the last 100 years," says Charles Guilford of Friendship, N. Y. "There have been four generations of us since we came to America from England at the time of the Revolutionary War. I suppose we were seeking opportunity and greater religious and political freedom. At any rate, we settled first in Brookfield, Madison County, and then later moved on to Friendship.

"My wife and I were married here 50 years ago. We celebrated our Golden Wedding Anniversary last February.

"Our three daughters were all born on the farm, and all of them have been graduated from University of Michigan. Mina, who has a Bachelor of Arts degree from Michigan, always was interested in the Dairymen's League. I joined the League almost at the start, and when I gave up the job of secretary of the Friendship Local after many years of service, she took it over."

*Mina Guilford, secretary of the Friendship Local, Dairymen's League;
and her father, Charles Guilford.*

DANIEL WEBSTER was a farm boy whose love of liberty led him to a position of respect and leadership both in the United States Senate and throughout the nation. His rugged faith in the benefits of united effort won for him the title of "Defender of the Union." Famous for his stirring oratory, his greatest burst of eloquence was heard when he argued for Union above all considerations of policy or profit . . . for the Nation above the State . . . and for unity of purpose above the squabbles of local pride. The words with which he ended this powerful and convincing speech still ring with music of lofty dignity and beauty: "*Liberty and Union, now and forever, one and inseparable.*"

Farmers everywhere love liberty as much as Daniel Webster ever did—liberty of thought and freedom of action unshadowed by fear of financial reprisal or boycott. Yet these fundamental rights were all but denied them during the unhappy years of dealer manipulation of milk markets. Throughout the long fierce struggle for a **LIVING PRICE FOR MILK**, many farmers—notably those of the Dairymen's League—were steadied by the wisdom in Daniel Webster's immortal words. They realized all too well that without unified purpose and cooperative action they could have no liberty.

But it wasn't until the great majority of farmers came to accept the basic wisdom behind Webster's words that the picture was changed. Then in quick succession came the Farmer Co-operatives . . . the Bargaining Agencies . . . the Federal and State Orders . . . all directly working toward **A LIVING PRICE FOR MILK** . . . all assuring farmers that their fundamental right to economic freedom and liberty of thought, speech and action was preserved.

Today, farmers of all shades of opinion are living in harmony in their Co-operatives and working in harmony with other farmers in other Co-operatives—much in the same way that the States of the United States live and work together. For that is the American Way—the way that guarantees the greatest prosperity and happiness for all. And these cooperating farmers knowing that unity safeguards their freedom, can repeat with Webster: "I live an American; I shall die an American; and I intend to perform the duties incumbent upon me in that character to the end of my career."

Maine Boy Wins Camp Miniwanca Trip

ARNOLD DAVIS of East Corinth, Maine, is the winner of the *American Agriculturist* two-week scholarship to Camp Miniwanca, Shelby, Michigan. This scholarship was announced by us on page 12 of the May 11 issue. The young men who made applications as a result of the announcement showed unusual achievements. In fact, any one of them, we feel sure, would have represented *American Agriculturist* at the Camp with credit. However, there was only one scholarship, and after a good deal of study, Arnold Davis was chosen.

To an unusual degree Arnold Davis has had to make his own way, and this in some part makes plain why he has been so ready to accept responsibility. As a student in the East Corinth Academy, he played baseball, basketball, and was Captain of the cross-country team. As a student of Vocational Agriculture, he won the district and state Future Farmer Speaking Contest, was a member of livestock judging teams, and attended the F.F.A. National Convention in Kansas City in 1939. He was President of his high school senior class, a member of the Student Council, and took part in a number of school plays.

The *American Agriculturist* scholarship to Camp Miniwanca is not given as a prize for any achievement. Rather is it given as an opportunity for some young man to secure training in leadership which can be put into practice right back in his own community. Every day at Camp Miniwanca is full of activity, designed to build young men physically, morally and spiritually. Athletics and fun occupy a prominent part, but equally important is instruction in leadership given by some of the best qualified men in the country.

In addition to the leadership evidence-

ARNOLD DAVIS

ed in school, Arnold Davis has been President of his Sunday School Class and is a member of his local Grange. Leadership always involves planning, and, subject to change, Arnold has pretty definite plans as to what he wants to do. Next year he plans to take a post graduate course at East Corinth Academy, and then to go to the Maine College of Agriculture at Orono, where he will specialize in dairy cattle. "After graduation," he says, "I plan to teach or manage a dairy herd until I have enough capital to acquire a farm of my own."

Arnold will be at Camp Miniwanca, which is operated by the American Youth Foundation, from August 12 to August 25. On his return we hope to

American Agriculturist, July 20, 1940

have for you a brief account of his experiences there.

Also attending Camp Miniwanca from New York State are four Future Farmers, two 4-H Club members, and one boy selected by G.L.F. The Future Farmers are: Clayton Young of Randolph, Norman Drummond of Rossie, Howard Brace of Randolph, and Thomas McMullen of South Worcester. Glen Underwood of Randolph will accompany them as an advisor.

The 4-H Club members attending, one boy and one girl, are: Francis Warner of East Berne, Albany County, and Marian Silsby of Gasport, Niagara County. Miss Silsby will attend the Girls' Camp from July 29 to August 11.

The boy who is being sent to the Camp by G. L. F. has not yet been selected.

What Do You Think?

IN RECENT visits to northeastern farms the opinion has been frequently expressed that Europe's war is in some way responsible for this season's unusual weather. Many Civil War veterans were definitely of the opinion that every battle was followed by rainy weather. Was it coincidence or was there a definite connection? What do you think?

Below you will find the comments of a number of readers on this subject. We plan from time to time to give similar comments on other questions which are puzzling readers. For the next issue the question is: "Is killing weeds the only benefit secured from cultivating crops?" Send your comments to: "What Do You Think?", *American Agriculturist*, P. O. Box 367, Ithaca, New York.

* * *

To use a bit of slang, I think that any idea that there is a connection between Europe's war and the weather is a lot of "hokey." So far as I have been able to find, no scientist has ever been able to establish any connection.—*Earl Beckwith, Ludlowville, N. Y.*

* * *

We have lots of hay, but it is another question as to whether or not we will be able to cure it. I think that the European War is affecting our weather.—*Francis P. vanden Bosch, Route 2, Lockport, New York.*

* * *

A number of people who have called at our roadside stand have suggested that the European War might be responsible for unusual weather. Personally, I doubt if there is any connection. We have had plenty of unusual seasons in the past, both dry and wet, in years when there hasn't been a war.—*Bruce Millard, Ithaca, N. Y.*

* * *

The use of so many explosives in Europe might have something to do with rainy weather here, although I am a little skeptical about there being any connection.—*Charles Naylor, Jordan, N. Y.*

* * *

I have heard some comparisons of this year's weather with that of 1917, but in my opinion neither the present war nor the first World War were responsible.—*Arthur Packard, Jericho, Vt.*

* * *

Definitely yes. Our local weather forecaster says no, but I think the terrific explosions in Europe—five times those of the World War—have something to do with it. We had the same condition during the World War.—*Seth J. Bush, Morton, N. Y.*

* * *

I think Europe is too far away for any condition there to have any effect on our weather.—*Harry Shriver, Baldwinsville, N. Y.*

Some Observations on Grade A Milk

By LELAND SPENCER

NOW THAT the heated controversy over Grade A milk has died down somewhat, it may be that some unbiased observations will help to clarify the issue and to bring about a sound solution of the problem. The authorities of New York City have made it clear that they intend to go through with their

Leland Spencer

proposal to recognize only one grade of milk (in addition to Certified milk) after September first, and recently the Advisory Committee on Milk to the State Public Health Council recommended similar action by the state.

The health authorities insist that their job is to see to it that all milk sold in the city is safe. They

say that Grade B milk is now safe and that there is no significant difference, from a health standpoint, between Grade A and Grade B. Thus there is no justification, say the health people, for enforcing separate standards for the two grades. Moreover, it is claimed that the recognition of two grades by the Health Department gives many consumers a false impression—makes them suspicious that Grade B milk is not entirely safe or wholesome for their children.

There may be some merit in these arguments, although it is doubtful whether many consumers are holding down their milk purchases because they lack confidence in the wholesomeness of Grade B.

Anyway, the health authorities have made their decision—they will not be responsible for grading milk after September first. What will be the situation then? Will there be any premium-priced milk sold, and if so, how will it be distinguished from ordinary milk?

After September first, each of the large distributors will probably have a special brand of milk for sale at a premium price. In fact, certain brands that have become well known in recent years in connection with Grade A milk will no doubt be used on this premium milk. The Health Department has ruled that brand names may not be placed on the bottle cap, but they will appear in bright letters and designs on the side of the bottle. Distributors will be permitted to guarantee the fat content of their premium milk on the cap as 4.2 per cent or higher.

So far the New York City administration has indicated its intention to discourage the advertising of superior sanitary qualities with respect to any brand of milk. It is to be hoped that no arbitrary rule of this sort will be enforced. Milk is handled with much greater care on some farms and in certain plants than in others. It should be possible to identify such milk by brand names if not by official grades, so that an extra charge can be made for it. Many consumers are willing to pay an extra price for milk produced and handled under especially sanitary conditions, as well as for milk containing more than the usual percentage of butterfat.

Obviously the distributors will have to practice a good deal of restraint if they are to avoid repeated conflicts with the city officials on this matter. This is where an association of producers and distributors of premium milk, comparable to the associations of growers of certified seed, could be very

useful. In the absence of grading by the health authorities, such an organization might well take over the responsibility of setting up standards for premium-priced milk and a code for advertising and sales promotion.

There is much speculation as to the quantity of milk that will be sold at the premium price after September first. This will depend upon the attitude of the city administration and also upon the price that is charged. If other conditions are not too unfavorable, and if the price charged for special brands of milk is not more than 2 cents a quart above the regular price for doorstep delivery, I should think the sales might be as large as Grade A sales have been in recent months—that is, about 10 per cent of the total milk sales in the market.

It is certain that fewer producers will share in the premium for special-quality milk, but those who are best able to meet the new requirements may receive nearly as much as heretofore.

Dairy Field Day for Western New York

Saturday, July 27, is the date of the Western New York Dairy Field Day to be held at Angelica, Allegany County. The principal speaker of the afternoon will be Lloyd Burlingham, Secretary of the National Dairy Association. This will be followed by a talk and demonstration, by Stanley Brownell of the College of Agriculture, who will show some proved sires, a proved cow family, and will talk about the selection of a young sire.

On exhibit there will be a proved Jersey bull with some of his daughters and their dams, 3 bulls from the first Allegany Holstein bull association, and a proved Holstein cow family owned by Arling Cobb of Whitesville.

To many dairymen the chief reason to attend will be the opportunity to look over a number of good young bulls and to buy a young herd sire. These bulls are not sold at auction but by private deals between buyer and seller.

Milk Dealers Bonded

New York State milk dealers to the number of 624 have filed bonds totaling over \$2,700,000 to guarantee payments to dairymen for the period of April 1, 1940, to March 31, 1941. The amount of the bond filed by any particular dealer depends on the amount of milk he handles.

Commissioner Noyes describes the situation as satisfactory, stating that the Department now has actions pending against only two dealers for failure to satisfy the bonding requirement.

Seneca County, N. Y., Grape Growers Run Own Deal

(Continued from Page 8)

mum of cost. The board is headed by Ed Beers of Glenora as president, Stanley Wagner of Lodi as Vice-President, Charles Donahue of Watkins Glen as Secretary-Treasurer. Other directors are Don Wickham and C. H. Beattie of Hector, Gordon Lambert of Fayette, and Byram Leonard of Romulus. Glen Mickel of Hector was engaged as manager.

In these days when nearly everyone runs to the government for a cure for their ills, it seems refreshing to find a group of farmers that had courage enough to look their own problem in the face and then do something about it. This spirit is just where we might expect, right among farm people, where independence and self sufficiency still reign.

The Marietta Concrete Way To A Bigger "Pay-Day" For Modern Method Farmers

Marietta's Super-Construction Concrete Silo—Fire and Storm Proof—Lock-Joint Concrete Staves, Air-tight Sealed Inside, Redwood Doors. Built for Hay—Also Most Perfect Silo for Corn.

Marietta's Concrete Barn—Fire, Wind and Termite-proof. Safe, Sanitary, Lasting, Economical, Profitable.

Made possible by Marietta's super-construction Concrete Stave "triple-treat" silos (1 for Hay Silage, 1 Corn, 1 Dry Feed), pictured here is "world's most modern complete livestock housing-feeding plant" . . . Takes owner out of FIRE, STORM, and DEPRECIATION "danger zones"! . . . New era 1-story, double-wall, air-conditioned concrete barn sets highest standard. Defies tolls of time. Economical to build. Safe. Sanitary. Efficient. Profitable. Insurance and upkeep savings alone "retire the investment." . . . Write NOW—for new (free) literature.

The Market Barometer

Hog Population Down

For the entire country our hog population is declining, following a peak in 1939. This year's spring pig crop is estimated at 8 per cent below last year, and the number of sows to farrow next fall is about 12 per cent less than last year. Therefore, the total pig crop for 1940 will be down about 10 per cent. The pig crop this year will be about 7 per cent larger than the 1929-38 average, but about 3 per cent below the average for 1924-33.

In New York State 191,000 pigs were born between December 1 and June 1, which is a drop of 14 per cent below last year's figures but is considerably above the ten-year average from 1929 to 1938 when the figure was 143,000.

Notes on The Up-State New York Potato Crop

The New York State potato crop is coming along nicely where planted early. The growers on the muck where more flooding occurred report good vine growth and a good set. Many muck acres will produce record crops this year. On the other hand many

pieces of potatoes on muck which were not properly drained have been drowned out and replanted in some cases. The same applies to many up-land fields which were planted in a normal season. Many fields show spots completely drowned out with vigorously growing plants on the well drained parts.

Due to the excessive rain many late potatoes were still being planted the week of July 8. This is at least three weeks later than usual but is in keeping with the delayed season all along the Atlantic Seaboard. Many growers think they are taking a chance on their crop but prefer to gamble with potatoes rather than the stock market.

Hasty inspection in central New York markets indicates plenty of new potatoes arriving from Eastern Shore of Virginia as well as the Carolinas. For the most part these potatoes are in good demand and moving freely at around \$1.75 wholesale, on the Regional Markets.

Much interest is being displayed by potato growers as well as machinery manufacturers in the coming Empire State Potato Club Summer Field Day which will be held at the farm of Gil-

bert Prole, Stafford, New York. Already there are more spaces reserved for exhibits than usual and all the committees are working very hard to make their individual part in the program be an outstanding event. Local committee is making arrangements to take care of feeding the multitude and everyone in attendance will be well cared for.—H. J. Evans.

Canning Crops

New York is the third state in the Union in acreage of snap beans for canning. This year the acreage of wax beans and green beans totals 7,300, which is 500 acres more than a year ago. For the entire country acreage of beans for canning is 57,590, compared to 54,860 a year ago and 76,010 two years ago.

A year ago dry weather cut yields of canning peas. This year New York is growing 38,900 acres of peas for canning and freezing. The crop is estimated at 31,120 tons, which is 50 per cent higher than the crop last year. For the United States, the canning pea crop is estimated at 293,160 tons, compared to 198,110 a year ago and a ten-year average of 204,140.

Onions

This year New York has 15,930 acres of onions—more than any other state. Michigan comes second with 11,100. In 17 late onion states the acreage this year is reported as 56,370, compared with last year's acreage of 58,750.

More Eggs in Storage

For the entire country the number of hens in farm flocks for the first five months of the year was about 4 per cent higher than last year, but egg production per hen was about 4 per cent smaller, so the total egg production was about the same.

On June 1 cold storage holdings of frozen and shell eggs were equivalent to 9,506,000 cases, 3 per cent higher than a year ago. Sixty-three per cent of the holdings were shell eggs and the remainder frozen.

On the same date there was 15 per cent more poultry meat in storage than a year ago. Stores of turkeys were particularly heavy, being 131 per cent above a year ago.

U. S. Department of Agriculture reports for the month of May showed 13 per cent fewer chicks hatched than a year ago, and for the first five months of the year hatchings were about 14 per cent below a year ago. On the other hand, chicks booked for delivery after June 1 were 14 per cent above last year.

More Time to Pay Land Bank Commissioner Loans

Reduced mortgage payments for some 5700 Northeastern farmers have gone into effect in the past six months by changing their land bank commissioner loans from a ten-year to a twenty-year repayment basis, according to a report by the Springfield (Mass.) land bank.

Until recently commissioner loans were granted in nearly every instance on a 10-year repayment basis, due to Federal regulations. This requirement has been changed so that new loans are given longer repayment periods, and those previously granted may now be rewritten. "Many farmers apparently prefer to leave their loans as originally contracted, and to pay them off as fast as possible," the report observes.

Commissioner loans, secured mostly by second mortgages, are handled like first-mortgage land bank loans through the 135 National farm loan associations in the Northeast. The land bank loans, however, provide for repayments over 20 or 33 years if only the required amounts are paid each season. The local associations, each a unit of the

land bank system, endorse and become liable for the first-mortgage land bank loans, but they have no liability on the commissioner loans.

Court Gives "O.K." to Rochester Order

On June 28 a court decision at Rochester upheld the Rochester Milk Marketing Order. The decision was unanimous, the opinion being written by Judge Francis McCurn on action brought by the New York State Guernsey Breeders' Cooperative.

Filled Milk Laws Upheld

The Supreme Court for the State of Kansas recently decided that Kansas' law prohibiting filled milk was constitutional. In Georgia a lower court dismissed a petition against the State Secretary of Agriculture for an injunction to prohibit the enforcing of the Georgia filled milk statute. The Georgia case will probably be appealed.

Prices Up in Europe

The Department of Agricultural Economics and Farm Management at Cornell reports that prices in western European countries are about 35 per cent higher than they were in August, 1939. Prices in non-European countries, such as Mexico, Argentina and New Zealand, have risen from 10 to 20 per cent.

During the last three good crop years, more food was imported into the United States than was exported. In order for exports of food to equal imports, it would be necessary to increase production 3 per cent over the average for 1937-39, and to export the amount of food shipped abroad during 1916-18 would require an increased production of 7 per cent.

These figures are of interest as bearing on the possible food requirements of Europe. It is generally agreed that a continuance of the war will see much of Europe's population faced with shortage of rations if not actual starvation.

State Fair Ready for Record Crowd

Record entries loom in virtually every department for the 100th anniversary New York State Fair, Syracuse, Aug. 25th-Sept. 2nd, according to State Fair Director Paul Smith. The sum of \$150,000 in prizes and premiums, the largest amount ever offered for a nine-day, nine-night exposition, coupled with the reduction in the running time of the fair from two weeks is responsible for heavy early entries upon which Smith bases his estimates.

Sweeping changes are being made in the Fairgrounds and in the many buildings on the 257-acre, \$5,500,000 plant. An extensive beautification campaign, calling for the planting of 285,000 bulbs and plants, is nearing completion.

The Horticultural Building is being completely revamped. Modernized throughout, the huge structure will be lined with modernistic booths, attractively set off with indirect lighting and enhanced by striking mural backdrops. All the exhibits in this building, including those of Granges, Farm Bureaus and other organizations, will present a marked change over previous years.

Preparations for the "Paths of Freedom," a gigantic spectacle, which will span the history of New York State, are already well under way. A cast of 1900 will participate in the huge pageant, which is to be held on a 600-foot stage.

Work is being pushed to complete the Indian arboretum in time for the fair. Vast changes are being made in the State Agricultural Museum, making it fittingly commemorative of the 100th anniversary of the Fair.

HERE'S QUICK CASH FOR YOUR CREAM!

The FARM NEWS

A.A.-Grange Cookie Contest to Date

POMONA GRANGE cookie contest prizes, which are being donated by American Agriculturist advertisers, will be shipped soon to chairmen of Pomona Grange Service and Hospitality committees. A complete list of these prizes was published in our June 22 issue, on page 12.

From many Granges we are getting enthusiastic reports of the excellence of the rolled sugar cookies being baked for the contests. Mrs. Charles Hasbrouck, chairman of Stone Ridge Grange, Ulster County, writes:

"Our judges had agreed to hold an informal discussion for the benefit of the patrons on 'Baking Secrets', but after judging the cookie entries they felt there were no secrets which the Grange sisters did not already know!"

Here is another long list of winners:

Subordinate Grange Winners.

		Mrs. Alta Nelson
		Mrs. Linnie M. Nichols

The Steuben Co. Farmers Tour

As has been the custom for the past five years, Steuben County farmers celebrated the planting of the spring crop and the beginning of the summer work with a tour to the metropolis of western New York on June 28.

More than three hundred fifty farmers attended the Sixth Annual Tour organized by the farm bureau so that farmers may observe the methods by which industry operates and enjoy a day of recreation.

Main objective was the plant of the Dunlop Tire and Rubber Corporation, where for two hours the party trudged through the twenty-two connecting buildings, to see the gum rubber, fresh from the tropical plantations, combined with chemicals, then impregnated into the cotton fiber, and finally made into automobile tires of such strength as to endure tens of thousands of miles of travel at high speed.

Dinner was served aboard The City of Buffalo, flagship of the Detroit and Cleveland Navigation Company, and in early afternoon the party boarded the Canadiana for a cruise to Crystal Beach, Canada.

Originally organized for the purpose of studying livestock marketing, the first Buffalo Tour visited the stock yards and packing plant, but in subsequent years the program has been enlarged to include such industries as Bethlehem Steel, Bemis Bag, Michigan Limestone, Buffalo Evening News, an automobile assembly plant, feed and flour mills, municipal airport, radio station, museum, and many other Buffalo industries.

Attendance at the six tours has totalled fifteen hundred seventy-five.

Juniors Have Part in Potato Field Day

Events of interest to junior potato growers will occupy a prominent place in the Empire State Potato Club Field Day at Stafford on August 8. In charge of junior contests are Melvin J. Merten, County 4-H Club Agent for Genesee County; Arthur J. Pratt, Cornell; Joseph Dermody, Oakfield; and Louise Mullen, Stafford.

Contests open to 4-H Club members and students in Vocational Agriculture will include variety identification, disease identification, and potato grading.

Grange Gleanings

(Continued from Page 7)

the New York State Grange, which will be held in various counties for con-

ferring the sixth degree of the Order in anticipation of the great Seventh Degree event at Syracuse in November. State Master Rich announces that such a sixth degree occasion will be held in any county where assurance is given of 300 or more candidates for the degree.

State Master Rich recently dedicated his first Grange hall, the new home of Bath Grange, No. 294, in Steuben County. The ceremony was very impressive, was largely attended, and the hall, beautifully decorated for the occasion, is fully appreciated by the hard-working Bath Patrons.

Sold, A Team

A short time ago we were calling on a man down in Pennsylvania. We explained to him the set-up of the livestock pages and the results that we were getting.

"I know all about your livestock pages," he said. "The fact of the matter is, I bought a team of horses from one of your livestock advertisers up in Central New York State. Incidentally, it is the best team that I have ever owned."

We run into many cases like this throughout the territory. It demonstrates the wide readership of *American Agriculturist* livestock pages and sales of livestock. More and more livestock buyers are constantly looking to these pages to supply their wants.

If you have livestock to sell and want to use this page, write your name and address below, attach your advertising copy and mail to *American Agriculturist* Livestock Department, Ithaca, New York.

NAME

ADDRESS

A ROAD That Goes Two Ways

This page in *American Agriculturist* carries messages two ways, two directions.

THE FIRST WAY

It brings to you a big field, not of hay or grain, or corn, or beans, or cabbage or what have you, — but a big field of FOLKS, — Folks who are in the market to buy a cow or a horse, or pigs, or sheep, or chickens, or something YOU may have to sell.

THE SECOND WAY

It is a direct road. This message carrier travels to over 190,000 readers with your message. It goes to a select group, — people who are in the same business you are in, use the same equipment, and may want to buy whatever you have for sale. Advertise in this page and know you are reaching a select group, what is called in advertising lingo "Complete Coverage". For details about it write

By J. F. (DOC.) ROBERTS

FUTURE conditions and future prices are probably more uncertain than any of us have ever seen them before, and that is doubtless why more people are talking with me about what to expect than at any time since I have been in the business.

Naturally, I do not know the answer. On the other hand, that is not a satisfactory reply. So I am at least going to give you my opinion.

I am an optimist on future farm prices. I do not believe it is going to be possible to have a long drawn-out or definite break in any farm commodity. As we know, nothing can stand still, and therefore there is only one way for it to go—higher. This does not mean anything along inflationary lines, nor does it mean that farm prices are going to make anyone rich; but I do believe we're going to have a steady and continuously better situation for all farm products.

This is not just an idle thought. Hogs have advanced almost \$1 a hundred from their recent low. Grains of all kinds are showing strength. Cattle, lamb and calf prices show a strong

consumer demand. The growing season throughout the country is more or less spotty. Too much rainfall and the cold spring have hurt Ohio, parts of Michigan, and all of our Northeast. Indiana, Illinois and the Northwestern states are having a wonderful growing season, with an abundance of rough feed and, in most cases, weather where it can be harvested. Colorado is very dry, and most of the other Middlewestern and Western states have had spots of too much water and too much cold, so when we add it all up there will not be as much stuff produced in the U. S. this year as there was a year ago.

Our industrial situation has very much improved, due to a large extent to war orders and greatly increased activity along these lines for our own use. This, of course, is temporary, but it will stimulate consumer buying power.

We hear a good deal about economic reprisals that Germany will inflict upon us, should she win the war; but that sort of thing carries very little weight with me because I have never seen it work out that way, although I have heard it talked a great many times. People always have, and will continue to, buy where they can buy to their own best advantage. Or to paraphrase a little, if we can make a better mousetrap and sell it for less, the world, including Germany, will come here to buy it.

So again, I can see nothing in the picture that is going to make it possible or probable that we will have lower prices on any farm products, at least between now and next spring.

Cheap Pork

By JOHN P. WILLMAN,
Cornell University, Ithaca, New York.

IN TIMES like these when market pigs are selling for such low prices one is apt to lose sight of the fact that the hog is a benefactor to man. He still excels all other farm animals in the economy with which he converts feed into edible flesh. He still is able to convert wastes into profit. Unfortunately some pork producers give their hogs too little cooperation in their job of producing human food.

Avoid Wormy Pigs

The wormy or runty pig will not be very successful in rooting the mortgage off of the farm. If the farmer wants to raise a group of healthy worm-free pigs he can do so by following a simple system of swine sanitation. The McLean County system of swine sanitation developed in McLean County, Illinois, aids farmers in preventing their pigs from becoming infected with worms. It consists of four simple steps.

1. All dust, dirt and litter should be removed from the farrowing pens. The floors and the walls for two feet or so up from the floors should be washed thoroughly with boiling water to which lye has been added. After the pen has been washed it

should be sprayed with a solution of some reliable disinfectant.

2. The dirt on the sides of the sow should be brushed off with a stiff brush and the underline, udder, feet and legs should be washed with lukewarm water and soap before she is placed into this clean farrowing pen. This washing of the pen and of the sow removes dirt which may contain worms or disease germs.
3. The sow and pigs should be hauled (not driven) to a "clean" pasture as soon as weather permits. A "clean" pasture is one on which no pigs have been kept for at least one year and has been plowed since last used by hogs.

4. Keep the pigs on this pasture until they are at least four months old.

This method of raising pigs will cut down the number of runts and will make pork production more profitable.

Prevent Anemia in Suckling Pigs

The suckling pigs may become anemic if they are kept indoors in these clean quarters for some time. Experiments have shown that anemia may be prevented in suckling pigs by swab-

bing the udder of the sow once daily with an iron solution. This solution may be prepared by dissolving about one pound of dried ferrous sulfate, or else an ordinary grade of copperas, in about one quart or slightly more of water. Treatment should be started when the pigs are only one or two days old. This treatment is not necessary after the sow and nursing pigs are turned out to pasture.

Pasture for Pigs

Pastures are the foundation of profitable pork production. A summary of numerous experiments shows that an acre of clover, alfalfa or rape pastured by growing and fattening pigs is equivalent in feeding value to more than 1100 pounds of corn and nearly 450 pounds of tankage. The total value of these amounts of feeds is greater than the crops produced by many acres of similar land in this state. An acre of such pasture should provide an abundance of forage for 20 full fed growing pigs from weaning time in the spring until the pigs reach market weight. Pork producers, especially those who plan to feed several pigs or older hogs this summer should seriously consider the possibility of cutting down feed costs by the use of good pastures.

New York Jerseys

New York State ranks third among states in the business of breeding Jersey cattle. During the past five years New York State Jersey breeders have registered 13,312 animals.

Lewis Morley, Executive Secretary of the American Jersey Cattle Club, at the annual meeting recently stated that during the past year New York State breeders registered 2,678 purebred Jerseys, 219 more than the previous year. The leadership of Delaware County as a Jersey center is being challenged. For some years there were more transfers of Jersey cattle in that area than in any county in the nation. This year Delaware County was 7th in number of transfers and 9th in the nation in the number of registrations. St. Lawrence County ranked 6th of all counties of the nation in the number of registrations.

For the past year a herd of 25 Jerseys, belonging to Ira G. Payne of East Schodack, led the Jerseys in the state with an average of 492.04 lbs. of butterfat and 9,870 lbs. of milk per cow. Mr. Payne's herd has averaged over 400 lbs. of butterfat for the past eight years.

Individual Jersey state championship for butterfat in 305 days went to Fon Sayda of the E. J. Cornish herd at Cold Spring with 850.56 lbs. of butterfat and 13,020 lbs. of milk. Leading Jerseys in butterfat production for 365 days was Imp. Canclaise from the herd of Carl Tucker at Mount Kisco with 1072.37 lbs. of butterfat and 18,822 lbs. of milk.

The history of Jersey cows in New York State dates back to 1855 when "Flora," the state's first registered Jersey cow, came to the Samuel Thorne farm at Thorndale.

Music for Bossy

"During the past winter we bought a new radio and moved the old 'residential' into the cow stable, after doctoring it up a bit with some donated second-hand tools. Well, say, I've sure enjoyed that cow-stable radio the past winter, Editor Ed. You know, I spend nearly 75 per cent of my time out there milking and chambermaiding for the bossies. I really thought the cows did give more milk, because I know they enjoyed the radio entertainment. One of the two cows never would stand good while I milked, always fidgeting around and stepping a little farther away from my milk pail, but with radio to help, Presto, they were calm, complacent and so meek, why it was a pleasure, they almost said, to yield me their milk."—C. B. D., N. Y.

(EDITOR'S NOTE: Well, I have always taken this idea of music for cows with a grain of salt, but maybe there is something to it. What do you think?)

SYNTHETIC RUBBER

THE FIRESTONE TIRE AND RUBBER COMPANY of Akron, Ohio, recently made an agreement with the Standard Oil Development Company of New Jersey to manufacture Buna, a material that looks and acts like rubber. In fact, for some purposes it is better than rubber. The fly in the ointment at this time is that it is considerably more costly; but it is comforting to know that, if we should be cut off from world rubber markets, it would not be necessary to drive automobiles with steel wheels. Eighty per cent of the materials from which Buna is manufactured comes from a relatively new process of making aviation gasoline. Other cold tar products are added to make an artificial latex which looks like milk and so closely resembles natural rubber latex that an expert cannot distinguish it except by a chemical test.

DAIRY WORLD OF TOMORROW

Attracting much attention at the World's Fair last summer was The Dairy World of Tomorrow, when an average of 141 purebred cows were milked daily on the Walker-Gordon Rotolactor. These cows produced an average of 42 lbs. of milk a day and, during the 181 days of

Vista Grande King, an Ayrshire bull owned by C. M. Rodriguez, Cropseyville, Rensselaer County, New York. This is one of the purebred sires exhibited last summer at the Dairy World of Tomorrow.

the exhibit, a total average of 304.5 lbs. of butterfat per cow. Cows from all of the dairy breeds came to the exhibit from 32 states and 3 Canadian Provinces.

The Dairy World of Tomorrow, an exhibit of the BORDEN COMPANY, will again be featured at the World's Fair at New York during the coming summer.

* * *

FOR BETTER JELLY

GENERAL FOODS, Battle Creek, Michigan, are offering to *American Agriculturist* readers the Certo Jelly-Making Kit, which usually sells for \$2.00, for \$1.00 and a label from a bottle of Certo. This offer is good only in the United States, and expires December 31. You will find a full explanation of what the kit contains on page 19 of the July 6 issue.

* * *

GUERNSEYS

THE GUERNSEY BREEDERS JOURNAL published a supplement to their May 1 issue. They called it the "Guernsey Travel Log," and it lists outstanding Guernsey herds in all states. It will be of interest and value to any Guernsey breeder who plans a trip this summer and will enable him to locate and visit farms, in any state, on which Guernseys are kept.

* * *

LESS PITCHING

The ALLIS CHALMERS COMPANY are testing out a new forage harvester especially adapted to putting up grass silage. Operating from the power take-off of a small tractor, the grass is cut, chopped, and delivered to a wagon right in the field. This is tending to make the

pitch-fork obsolete. The machines can also chop dry straw or hay in the field.

* * *

HAY-MAKING WRINKLES

THE FOX RIVER TRACTOR COMPANY, Appleton, Wisconsin, is featuring a pick-up hay cutter which takes the hay from the windrow, chops it, and delivers it into a truck. It can be used to make grass silage, corn silage, or to chop dry

hay. In fact, it can be set up at a silo filler and be used there.

Another relatively new method of storing roughage is called a Hay Maker. This is a round structure, somewhat resembling a silo but usually larger in diameter, with the outside walls perforated to allow air circulation. In the center there is also a ventilating shaft which can serve as a place to throw down hay. Such a hay keeper is manufactured by the MARTIN STEEL PRODUCTS CORPORATION, Mansfield, Ohio.

* * *

NEW DISCOVERY IMPROVES LARD

SWIFT AND COMPANY of Chicago, Illinois, make an announcement of importance to hog growers. Research has discovered that the addition of small quantities of a vegetable substance keeps lard fresh and maintains its food value when it is exposed to air without refrigeration.

The material is known as gum guaiac, and comes from the sap of a tree which grows in the West Indies and Central America. Swift and Company have applied to the U. S. Department of Agriculture for permission to manufacture lard containing gum guaiac under federal inspection, and permission has been granted. An experimental promotional campaign has been started in test areas.

America's "outstanding homemaker of the future," Jane Crampton, 17, of Meridian, Miss., national winner in a country-wide Foods Contest, sponsored by Servel, Inc., holds the southern cornbread she has just baked in a demonstration given in the All-Gas Living Kitchen of the "America at Home" Building, at the New York World's Fair. Miss Jane Tiffany Wagner, Director of Servel's Home Economics Department, and one of the contest judges, prepares to sample it. More than 8,000 high school students in 40 states took part in the contest. The New York trip was part of Miss Crampton's national award.

NEARBY MARKETS for NEARBY POULTRYMEN

Too Much Water By J. C. HUTTAR

ABOUT this time last year we began to realize that we were experiencing a real drouth in the Northeast, and before the snow flew many parts of this section had established some new records for no water. And look at it now! As I sit and write this I

J. C. Huttar

can look out of the window at a piece of hay that my brother-in-law, Wilbur Briggs, had cut early in June, and there it is yet.

So while we have certainly balanced last year's dry spell with some to spare, I'm thinking of too much water in another connection.

I guess it has only been for five or six years that we've appreciated the value of water

in helping to keep up egg quality. I've been one of the strongest boosters for it. But you can have too much water.

Some of you folks may remember the experience I had in selling a batch of eggs which had been dipped in the milk cooling tank on a Pennsylvania farm. When we got them in New York they looked just about perfect before the candling light. Customers fought for them. It was the month of July. Three days to a week after they took them from us, every one of these customers came back with a woeful tale that the eggs were turning rotten either on their hands or in retail stores. I kept the next batch, received from this poultryman under observation for a week. It was hot. They started off looking beautiful. In a week about two-thirds of them were black rots. Some never did rot.

A Utah cooperative association tried water cooling their eggs several years ago and had exactly the same experience. In these cases, of course, germs were spread in the water which later caused the rotting.

Just lately I've seen quite a few shipments which showed the effects of too much water in another way. Either these folks have gone too far in supplying moisture to their egg holding rooms, or the long rainy spell has gotten the best of their cellars. The way it has showed up lately is through mustiness and mold on the eggs and in the cases. Mustiness sure ruins the market value of an egg.

Air Must Move

I think it would be too bad to lose the progress we have made in keeping eggs from drying out as they cool, but we must use the water the right way. As long as the air in the egg room keeps circulating, either by fan or natural draft, there isn't much danger of harm.

From all I've seen on farms and then examining the eggs in New York I'd say that eggs should be treated about like this between the time they're laid and shipped:

Gather them at least three times a day in wire or wicker baskets. Take them straight to the egg room where the temperature should be held under 60° F. if at all possible. Have enough moisture in this room so that the relative humidity keeps between 70% and 80% and see to it that the air moves steadily but not fast. If the room ever smells musty, air it well before you put eggs back into it.

There are several ways to supply this water. A shallow bed of sand that

is always kept moist over which the eggs are cooled overnight, either in wire or wicker baskets or on screens, is good. Water pans standing around the floor or a stream running through the cellar work fine on several farms I know. A fine spray of water up against the cellar wall is good too.

The egg cases should be kept in the egg room from 2 to 3 days before they are filled. Not longer.

Remember that eggs should not be allowed to dry out as they are cooling. But don't drown them or keep them in a moist room where the air is dead.

* * *

Eat More Eggs

On July 22 at St. Louis, Missouri, the National Egg and Poultry Board will be set up. These are the fruits of the work done by the Poultry Industries' Planning Committee which was set up at the World's Poultry Congress.

The Board will have about 50 members, one from each important poultrymen's association in the country and representatives of egg dealers, feed manufacturers and others who make their living off the hen.

The purpose of the Board is to set up a permanent organization to promote consumer education on poultry and eggs. In other words the poultry industry is going to boost eggs and poultry as food. Fruit men, creamery men, livestock producers, milk producers and many other farmers have been plugging their products to the tune of millions of dollars each year. It looks like a case of "get in the swim or give up the ghost."

One way we can get folks eating a lot of eggs and poultry is practically to give them away. The other way is to advertise.

Jefferson County, N. Y., Turkey Growers Report New Disease

Turkeys in Jefferson County, New York, have been dying from a new disease called hexamitus. One grower, it is reported, lost 1,000 turkeys in a week. The disease is highly infectious, and turkey growers are urged to keep away from other turkey farms because of the danger of carrying it on their feet.

It is recommended that turkeys be moved frequently to a new range, and that the following treatment be given:

Add 1 cup of vinegar to a gallon of water. Then dissolve 1 pound of copper sulphate in it. Put a tablespoonful of this mixture in each gallon of drinking water which the turkeys get.

As yet we have had no reports of this disease from other areas in the Northeast.

"Today in school we learned all about the care of the teeth, Mama."

AMERICAN AGRICULTURIST

A general view of the laying houses on the farm of Arthur Guzman.

EFFICIENCY on a Connecticut Poultry Farm

By CLIFFORD KNIGHT

EFFICIENCY is ever the objective of Arthur J. Guzman, owner of Oakhurst Poultry Farm, located on Bolton Road in the Town of Vernon in Connecticut. Started in 1908, Mr. Guzman's vast plant is one of the state's largest producers of market eggs.

Entire buildings have been remodelled when some different system or arrangement would make for higher production, better sanitation, or easier operation. For instance, there is Mr. Guzman's water system. High up on a hill he dug and cemented a huge storage tank which insures a reserve of water ample for any emergency. A steady stream flows by gravity to long troughs in each of the pens—fast enough to prevent freezing and to remain always pure.

Three-Year Rotation

There are over 100 broad, rolling acres in the Guzman farm. About 60 acres are cleared for ranges, used in a three-year rotation without cultivation. Here again, efficiency is the watchword, even to towing a grain drill behind an automobile to scatter scratch feed.

Visitors are always impressed with the neat straight rows of colony houses. When the disastrous hurricane struck Connecticut, most of these were destroyed; but they were soon replaced by range shelters. Mr. Guzman, a man with a firm jaw and a forceful manner, is not easily discouraged. If he had been, during the early days of his poultry work, he would have quit altogether, for he had enough setbacks to balk a less determined character.

The Guzman family seems to be excellently coordinated to work in complete harmony and unity of purpose. "There's just my wife, my sister, and myself, unless you include my son who is an honor student at the University of Connecticut. We use extra help only to clean up buildings or to move colony houses. Or," he added with a grim smile, "to repair buildings after a hurricane."

Buys Sex-linked Pullets

About two years ago, after careful study and thought, he tried sex-linked pullets. He was so pleased with them that he stocked them again this spring. As early as last August he foresightedly ordered his 1940 sex-linked pullets—but 9,000 this time instead of 6,500 since he finds he can tend still more than in previous seasons.

He says that they are more sturdy than anything he had previously tried and are better able to take care of themselves in large flocks. The mortality in the brooder house was a mere three per cent, and the range losses were almost negligible. Mr. Guzman dresses and sells at retail what few adult birds (about 10 to 20 a week) go out of condition. He says they made clean, plump, blocky carcasses, too. Raising only pullets, he has about eliminated the cockerel problem. He is able to give the pullets more room, does not have to employ extra labor, and is able to devote his full time to the job of producing eggs.

Mr. Guzman, with his sex-linked pullets, gets a 180-egg average produc-

tion. Over 75 per cent of his eggs grade 26 ounces and better per dozen and are among the finest received at the East Hartford auctions.

A trip through the laying houses reveals not a partition anywhere; the birds run in one group. To control ventilation, all windows may be raised or lowered with a turn of one crank in each house. Behind the four single-deck laying houses is a double-deck brooder house, with a centrally heated hot water brooding system and with a feed or litter carrier. Here all his chicks are started and carried to 12 weeks of age. He has 31 colony houses on his pullet range.

Mr. Guzman firmly believes that the success of a poultry farm depends in part upon the interest and aid the farm wife gives to the business. He is thinking of his wife whom he considers one of the most expert poultry cullers in the world. He challenges any poultryman to try to beat her!

Mr. Guzman, in addition to his very successful poultry farm, finds time to devote to church and town affairs. He has been honored with election as a Selectman of the Town of Vernon, and is an officer in the Town of Vernon Taxpayers Association. He is President of the Central Connecticut Co-operative Farmers Association, which has central offices at East Hartford. He is also a member of the Connecticut Farmers Cooperative Auction Association, which also has its offices in East Hartford.

Shade for Pullets

Do chicks need shade and is an orchard a good place to keep them?

Chicks do need shade, but the best way to provide it is by the use of range shelters. In areas heavily shaded, as they will be in an orchard, chicks are almost certain to pick up slugs which act as intermediary hosts for worms. A good grass range will provide green feed and range shelters will provide shade. It is important to avoid wet spots on the range. Therefore, it is becoming common practice to have wire floors in range shelters and to have a raised platform covered with wire around the water fountains.

Avoid Bare Ranges

Where pullets are out on range, how many is it safe to allow per acre?

Four hundred growing pullets per acre is about the most you should have. If the soil is gravelly or sandy, a few more may do no harm. It is equally important to have the birds well spread out over the entire area. Naturally, they congregate around the houses or range shelters, and before long the ground around the houses is bare. That is one reason for moving the houses frequently.

Vegetables, berries and other fruits, given the proper treatment with the right seasonings, fill your cellar shelves with zestful pickles and sweet spreads against next winter's needs. Don't fail to make some of "H. R.'s" favorite pickles and choice preserves, recipes for which are given on this page.

drained, cooked fruit and cook rapidly until fruit is clear. Seal in hot, clean glasses. Quinces may be mixed with an equal quantity of sweet apples or pears.

Berry Preserves

3 lbs. sugar

4 lbs. berries

Pick over, wash and hull the berries. Add the sugar to the berries and heat gently until the sugar

It's Time to Talk of Pickles and Preserves

by
MRS. GRACE WATKINS HUCKETT

PICKLING is preserving fruit or vegetables with salt water or vinegar. They may be whole or in pieces, sweet, sour or spiced in any variety of combinations.

Vegetables are scrubbed and if too large are chopped or cut into smaller pieces. Vegetables usually are soaked in salt water, which draws water from the tissues and makes the vegetable more crisp and firm, after which it is better prepared to absorb the pickle solution. Fruits do not require this preliminary soaking in salt. The standard method of curing cucumbers in a salt solution for several weeks and then heating it in the vinegar pickle gives the finest texture and flavor. Dill pickles, also a cured product, have a unique flavor because of the process and the dill which is added for flavoring. Both processes of curing require some weeks, and since I have described them in detail many times on these pages, I am giving you here recipes which belong in the quick method group.

In making any pickle it is well to bear in mind these few facts: (1) use porcelain-lined granite-wear or aluminum kettles for cooking pickles, and a granite or wooden spoon for stirring or lifting them; (2) too much salt toughens and shrivels the vegetable; (3) too strong vinegar may bleach or cause the vegetable to soften after it is pickled; (4) best results are obtained if pickles are sealed in glass or stone jars.

"H. R.'s." FAVORITE PICKLES

Tomato Barbecue Sauce

1 quart sliced onions, 3 quarts tomatoes
6 red peppers 1 tablespoon salt
6 green peppers ½ teaspoon pepper

Strain seeds from tomatoes, add all ingredients; cook over low heat until thick. Seal. This is fine with meats or to pep up bland dishes.

Green Tomato Pickles

1 peck green tomatoes 1 teaspoon white pepper
(sliced) 1 cup salt
5 green peppers (sliced) 2 red peppers (sliced)
5 large onions (chopped) 3 cups brown sugar
1 tablespoon allspice and cloves

Soak tomatoes in 2 quarts water with the cup of salt. Drain, add vinegar to barely cover, then rest of ingredients. Cook until just tender. Seal hot.

Grandmother's Pickled String Beans

Cook string beans until tender in boiling, salted water. Pack in jars, add 1 bay leaf and a teaspoon celery seed to each quart jar. Fill jar with a mixture made by heating equal parts strong vinegar and water.

Lazy Day Pickles

Fill sterilized jar with sliced, medium cucumbers.

In top put 1 teaspoon whole mixed spices, a tiny onion and 3 tablespoons sugar. Pour over boiling vinegar to cover. Seal. Good in 2 weeks and so easy.

Baked Sweet Apple Pickles

7 lbs. pared, quartered 1 quart vinegar
sweet apples 1 teaspoon whole cloves
3 lbs. brown sugar 1 oz. stick cinnamon

Place apples in crock, add other ingredients well mixed and bake 1 hour at 350°. Remove to sterilized jars and seal.

PRESERVES

Preserves are fruits in which the tissues have absorbed a heavy sugar syrup until they are filled with it instead of with water. A good preserved fruit is plump, tender, sweet, bright in color, clear and sparkling. Hard fruits such as pears, under-ripe peaches, sweet apples, quinces, watermelon rind and citron need to be cooked in water until tender before putting them into the heavy syrup. The tender fruits, cherries, ripe peaches or berries, may be placed at once in the heavy syrup. Rapid cooking preserves flavor and color, whereas too long cooking gives a dark, stiff product.

The usual amount of sugar used in preserves is ¾ lb. sugar and ¾ cup water to each lb. of fruit. Tart fruits, such as gooseberries, require equal weights of sugar and fruit. Usually, dissolve the sugar in the water and boil syrup for five or ten minutes before adding the fruit. If a very rich preserve is to be made, the syrup may be boiled until it spins a thread before adding the fruit.

The best method of keeping preserves is to seal them in hot, clean jars. Some people go so far as to steam the jars of preserves in boiling water for 10 min. as a special precaution against molds. All jars, rubbers, spoons and utensils used in handling the preserves should be sterilized in boiling water.

Cherry Preserves

2 lbs. sour cherries, 1½ lbs. sugar
weighed after stoning

Add the sugar to the stoned cherries and bring quickly to the boiling point. Cook rapidly until the fruit is clear, skimming as necessary. Pour at once into clean, hot jars and seal.

Quince Preserves

3 cups water 3 quarts sugar
4 quarts prepared fruit

Scrub quinces, wash, pare, core and quarter. Save all the good parings and cores for jelly. Measure the prepared fruit, put in preserving kettle, cover with cold water and cook until tender, then skim out and drain. Save the water to cook with the parings, cores and gnarly fruit for jelly. Make a syrup of the sugar and water and boil for 5 min. Add the

dissolves and the juice is drawn from the berries. Cook rapidly until the fruit is plump and transparent and the syrup thick. Pack carefully into clean, hot jars and seal. This method is good for all berries except blackberries, which because of hard seeds may be objectionable.

SOME OF "H. R.'s. CHOICE PRESERVES

Peach Perfection

5 lbs. sliced peaches 1 lb. seedless raisins
4 lbs. sugar ½ lb. chopped nuts
Juice and rind 2 oranges

Mix all ingredients together, simmer for 45 minutes. Seal in sterilized jars.

Streamlined Apple Butter

2 gallons cider 1 teaspoon cinnamon
1 lb. brown sugar (more spices if liked)
6 quarts pared, sweet apples

Cook cider down ½ in volume, add apples and sugar; cook until thick and of the consistency of apple butter. Add spices and seal.

Blackberry-Apple Jam

6 quarts blackberries 2 quarts white sugar
3 quarts sliced apples

Crush together, add sugar and cook gently for 40 minutes. Seal hot.

Apricot and Quince Marmalade

2 quarts sliced apricots 3 lbs. sugar
1 quart diced quinces

Mix well, start over slow fire and cook in own juices for 1 hour. Seal.

Pickled Prunes

4 pounds prunes 1 tablespoon stick cinnamon
2 pounds sugar 1 tablespoon whole cloves
2 cups vinegar 1 tiny red pepper

Simmer all ingredients together until prunes are just tender. Seal at once in sterilized jars. Excellent with cold meat or game.

Mother's Raspberry Preserve

Select freshly picked red or purple raspberries, discarding all soft or under ripe fruit. Weigh accurately, allow 1½ weight of sugar for berries, that is, 1 lb. berries to 1½ lbs. sugar. Crush very thoroughly, mix in sugar well. Let set 12 hours, stir again. Seal in hot sterilized jars. Wonderful in winter shortcakes, on hot biscuits, or as a layer or roll jelly cake filling.

Pear Gold

8 pounds pears 4 pounds sugar
1 No. 2 can crushed pineapple

Cook pears until soft in a little water, add sugar and pineapple. Cook gently until thick and clear.

BONNET INCL.
3354

3127

fabric, $\frac{3}{8}$ yard contrasting, $1\frac{3}{4}$ yards ruffling, $\frac{3}{8}$ yard 27-inch crinoline, for bonnet and pinafore.

MORNING FROCK PATTERN No. 3127 is simplicity itself to make and is styled for all sizes from 16 to 50. Size 36 requires $2\frac{7}{8}$ yards of 39-inch material, $\frac{1}{2}$ yard contrasting.

Today in Aunt Janet's Garden

Garden is a Refuge

EVEN though there is constant battle in the garden against pests and disease, wind and weather, it remains almost our one refuge from the bombardment of war talk and war news which is all about us as long as we are near the radio or with people. Therefore at this time when all of us need some spot where we can get in touch with normal life once more, the garden becomes more important than ever.

In the garden, familiar laws operate as we have become accustomed to expect them to do; plants respond to right amounts of moisture, food and sunshine, and go ahead performing happily just as they have always done. The fact that everything in the world that we thought was secure, right and just seems to be completely reversed, does not affect the behavior of our plant friends. They may be trying enough it is true, but we can nearly always find the reason why. It is usually in proportion to neglect—this is a natural consequence which we can see as normal cause and effect. On the other hand these same plants respond gratefully to intelligence and care. This simple and obvious behavior has a very wholesome effect upon me when I retreat to the garden for a few minutes away from the turbulence of what now constitutes everyday living. It is comforting to know that in the garden at least I can find the right answer to a given problem.

The answer may not come until next season; for instance I hope my peonies will bear larger flowers next year because I have followed a well-known rule of leaving a leaf or two on each stalk and of not cutting away all stalks on any one plant. The leaves manufacture next year's flower supply and, as is the case with bulbs, no foliage left there means no flowers next year. When cutting gladioli it is well to bear this in mind and let a few leaves remain.

As soon as chrysanthemum buds form, some may be pinched off in order that those remaining may make larger blossoms. Removing buds at the sides leaves the remaining terminal bud which normally opens first. However, if the terminal bud is pinched out, leaving the laterals, the blossoms will come later. This is one way of prolonging the blooming season.

If the first trusses to bloom on the phlox are cut off when faded, there will be a later crop of laterals. This serves another excellent purpose in that it prevents seeds forming and falling into the borders. Phlox seedlings are rarely true to color, hence it is better to keep them from coming up in the borders where they may crowd out the finer and less vigorous hybrids. Seeds should not be allowed to form on any of the plants, since making seed is the hardest work a plant is called upon to do. It seems wiser to conserve the strength of the plant for further blooming and to buy one's seeds from companies who grow them scientifically and true to name.

DRESS RIGHT for Work or Play

EVERY wardrobe nowadays needs playclothes, no matter whether the wearer be mother or daughter. Seersucker, piques, broadcloths, chambrays, percales and gingham are sturdy and colorful.

And there is no reason why house-dresses should not be colorful too. Get materials most becoming to your own coloring and patterned according to your own size, and be as well dressed at home as on the street.

PINAFORE PLAYDRESS PATTERN No. 3354 is much the vogue and may be worn with or without the blouse. The cute bonnet pattern is included. Pattern sizes are 12 to 20. Size 16 requires $1\frac{1}{2}$ yards of 35-inch material for blouse; $4\frac{1}{8}$ yards 39-inch

"Go; and never darken my door again."

HERE'S WHY I INSIST ON CERTO

...THE "TRIED AND TRUE" PECTIN THAT TAKES THE GUESSWORK OUT OF JELLY-MAKING

says Mrs. F. B. Tillou, Jr.
of Oxford, New Jersey, vet-
eran Jelly Champion who has
won over 150 prizes for jams
and jellies made with Certo!

Watch Mrs. Tillou demonstrate to her neighbors how Certo saves time, money and work!

1. "There's no excuse for jam or jelly failure nowadays," says Mrs. Tillou. "With Certo, any woman can make perfect jelly and jam from any fruit she sets her hand to—even hard-to-jell fruits like strawberries and pineapple. And jams and jellies made with Certo have just the right texture, too!"

2. "No slaving over a hot stove —when you use Certo. For Certo cuts the boiling time to $\frac{1}{2}$ minute for jellies—only a minute or so for jams. You're through in just 15 minutes from the time your fruit was prepared."

3. "11 glasses instead of 7—and all from only 4 cups of juice! You can see for yourself that Certo gives you actually half again more jam or jelly. For due to that short boil, no costly fruit juices boil off in steam."

4. "Better tasting jams and jellies you never ate! For that short boil saves flavor, too—so jams and jellies made with Certo have the full flavor of fresh, ripe fruit. And Certo alone gives you 77 recipes—another important reason why jelly champions insist on this 'tried and true' pectin!"

A product of General Foods

Look for the tested recipes under the label of every bottle of Certo.

Bees and Bears

IN THE MONTH of September many years ago, the writer and another young man, whom we called Thad, began "lining" bees. We suspected that a number of swarms had located their nests in a large forest to the southwest of the town in which we resided.

The land of this township had been but recently cleared up, and there were an abundance of wild flowers and flowering trees. Such a region is favorable for honey-bees. A number of the farmers kept them, and many swarms had, from time to time, flown into the woods and found homes for themselves in hollow trees. Sometimes these "wild" swarms would return to the farms to rob the hives of their old neighbors.

Thad and I believed that at least some of these forest bees held great stores of honey. To find these store-houses and to capture the stores of sweets was the purpose my friend and I (then young fellows of seventeen and eighteen years of age) had in "lining" the wild bees.

Bees, on setting forth from their nests in search of honey flowers, take a roundabout route, flitting here and there as they happen to spy a flower. But when they have collected as large a load of sweets as they can carry, they rise in the air and fly homeward in a straight line. From this habit originated the phrase "bee-line", used to describe a direct course. In order to take advantage of this habit, we provided ourselves with several pounds of honey and a dish containing a little fine wheat flour. Going some distance from the hives of tame bees, we spread a little of the honey on a clean board. Setting it up in a conspicuous place, we scattered about it bunches of bright-colored flowers, in order to make it more attractive to passing bees.

Having set our trap one morning, we left it till afternoon. On visiting it about three o'clock, we found a dozen of busy bees loading themselves. While they were thus engaged, we gently dusted them with the flour, whitening their backs, so that we might again recognize them.

As soon as they had loaded themselves, they flew off, and we observed that while some took the direction of the farm houses, where the hives were, others made directly for the forest. Noting, as clearly as we could, the course of the forest bees, we followed them. At the distance of a quarter of a mile from our first honey-board, we set up a second one.

After visiting their nests in the woods and unloading, the bees, without losing a minute, again started in a straight course for the first honey-board. But in passing over the second board, first one bee and then another, seeing or scenting the honey, would settle on it. We noticed that most of these bees had their backs floured, and from this circumstance we knew we were in line of a particular swarm in the woods.

By setting up a number of honey-boards, we were able to trace the bees to the borders of the forest; then, by sighting back, we could almost lay out the direct course to their nest. Following this course through the woods by the aid of a compass, we were tolerably certain of arriving at their tree, whether it were near or far off.

In following the course, we would carefully examine the large trees as we passed on, listening for the steady hum which, during the working season, indicates a bee-tree, and often knocking on the trunks to draw the bees out.

I remember the first nest we found,

By C. A. STEPHENS

and the odd adventure Thad had with it.

In following the "line" of certain bees for nearly two miles into the woods, we came out on the shore of a large pond, called Overset Pond, from a high crag which overhung the water on the other side. Sighting across the pond, we were about going round to take up our course on the other shore, when it occurred to Thad to go out on a little point near by which projected into the water.

In a moment I heard him shouting, "Here it is! Here's their tree!"

Sure enough, the swarm we were tracing was in a great swamp elm which, at the extreme end of the point, leaned over the pond. It was a very large tree, being fully four feet in diameter, and without a limb for thirty-five or forty feet up its trunk. It seemed very old, and was somewhat decayed.

Thad had heard the deep hum of the swarm inside, and we could see the bees go out and in through a woodpecker's hole in the trunk on the pond side, some four or five feet above the first limb. A rap with an axe on the trunk not only indicated that the tree was hollow, but sent out numbers of angry bees buzzing hither and thither.

"But how are we going to get 'em?" asked Thad. "If we cut down the tree, it will fall into the water and spoil all the honey."

It was not an easy matter to manage. We thought over various plans. Thad cut through the hollow part at the base, but no bees came out. It was a dark hole, smelling of rot, though we saw that now and then honey, mixed with black dirt, dripped into it.

We judged that a mass of old comb filled the upper part of the trunk, above which mass the bees had their storehouse of honey. Thad thought that if, by plugging up the woodpeck-

er's hole, we could imprison the bees. Then by cutting into the trunk a few feet lower down, might take out most of the honey.

I did not think this a very good plan, but neither of us could hit upon a better. It was necessary to choose a time when all the bees should be in the tree, or they would make it "hot" for whoever tried to stop the hole to their nest. So we went home and waited for a wet day.

On the following Tuesday it poured, but we set off, carrying an axe, two milk pails and a long clothes line. After a wet walk, we arrived at the bee-tree.

Thad tied a number of loops in the line, and knotting a stone in its end, threw it over the limb beneath the bee-hole. It was a large limb, being quite a foot thick. Fastening the ends of the line to the ground, he proceeded to climb up by his loops, with the axe slung on his back and a great wad of newspaper in his pocket, with which to stop the hole.

The rain kept the bees in their hive. Thad climbed up without seeming to disturb them much, though I could hear inside now and then a low hum as his feet hit against the hollow trunk. But he got on the limb without exciting any of them to come forth, and adroitly pushing in his paper wad, completely stopped the hole.

"All right!" he sang out to me. "I've got 'em—snug as a bug in the rug!"

Striding the great limb, he unslung his axe and began to cut into the trunk about five feet below the bee-hole.

The first stroke of the axe roused the bees. They began to roar inside, and with each succeeding blow, they buzzed and roared all the louder. It was an immense swarm.

"If they should get out, they'd riddle you, Thad," I said to him.

"Yes—but they can't get out," Thad coolly replied.

"I've got most through to the honey," he called out to me a few minutes later. "Be ready to haul up a pail."

But the jar made by the axe blows had another effect besides stirring up the bees—one which Thad did not expect. It loosened the paper wad. All at once it fell out and came tumbling down. Out poured the bees by the quart, and fell upon Thad with drawn stingers.

I had untied one end of the line and was hauling up the pail, thus cutting

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

The Moving Finger Writes

A pencil has a clever way
To make amends for its mistakes.
A bit of rubber on one end
Erases every slip it makes.

How fine if people were equipped
To thus correct the wrongs they do.
For errors on our Page of Life
We humans need erasers too.

—Mary E. Linton,
2525 Benton Blvd.,
Kansas City, Mo.

off Thad's escape to the ground. He dropped the axe and scrambled out on the great limb as the maddened insects stung him, screaming:

"Oh!-oh-h-h-h! Murderation! Gracious me!"

The air was black with angry bees buzzing all round him. He was in a terrible "fix."

"They'll sting me to death!" he screamed, as he scrambled to the end of the limb, about fifteen or twenty feet from the trunk.

Beneath him was the water, five or six feet deep, with a soft, muddy bottom. Thad knew that as well as I did; but it was death to stay on the limb.

Swinging down from the boughs, which bended under his weight, he hung a moment, his feet dangling twenty-eight or thirty feet above the pond—then he dropped!

I remember just how he looked as he came down, the bees darting at his head!

He hit the water with a great splash and, fortunately, his feet struck on a sunken log, and that saved him from sticking in the mud. I ran into the water, and catching hold of his hand, drew him out, receiving a few stings myself. Then we ran to cover in the bushes.

Thad had been stung in not less than thirty places, so he said; and the looks of his face and hands justified his statement. He was sick for a day or two afterwards.

We did not again disturb those bees for several weeks, waiting until November. When the pond was frozen over, we felled the tree on the ice. The bees were then enjoying their winter's sleep. They did not molest us, and we secured the honey without difficulty. I think it was twenty-three pounds of clear honey we took from the tree, besides an inferior lot, mixed with old comb and dirt.

That fall we "lined" six swarms of bees, all of which were in large, hollow trees that had to be felled.

After felling the trees and the bees had quieted down, we disposed of them by heaping a mass of dry bark and boughs about the holes to their nests and setting it on fire. The insects, driven out by the heat and smoke, would dart into the blaze, and in a moment singe off their wings.

We met with another rough adventure at the fifth tree. It was a large beech, an old tree, little better than a stub. The bees were located near the top, going out and coming in through three holes made by "yellow hammers," which had once built their nests in the inside. It was in an odd place, located among great rocks, and surrounded by hemlock thickets.

After destroying the bees, we split

The Song of the Lazy Farmer

IN HARVEST days, when weather's hot, there ain't a thing that hits the spot like sittin' peaceful in the shade to quaff a jug of lemonade. I'm always fearful that I'll get myself warmed up and overhet, a feller's constitution is a thing he can't replace, gee whiz, so when the sun is boilin' down and raisin' blisters on your crown it pays to rest a while and stop, and not work till you nearly drop. Humidity instead of heat it is that gits a feller beat, so neighbor says; and yet, by gee, humidity inside of me is what I need and so I glug the lemonade from out of the jug.

Some day when wind is in the north why maybe I will sally forth and do my work, but when it's hot I'd rather seek a shady spot where I can fan myself and sit; a feller can't do ev'ry bit of work in one lifetime or two, and so I say the thing to do is take it easy when the heat would cook you like a piece of meat,

unless you use your common sense, and seek a tree beside the fence where you can sit a while and doze while chiggers nibble at your toes. I don't believe in this here blitz, I take my time at workin', it's lots easier to meditate and if I don't accumulate a lot of wealth to leave my wife, I git some pleasure out of life.

the log open and filled two pails with comb without taking half of the honey. As we had only these two pails, we went home with our load and, after dinner, returned for the rest of the honey.

But during our absence another party had found the honey. Going in through the hemlocks, we found ourselves face to face with an old she-bear and her two cubs, helping themselves most greedily to the luscious comb.

It was as funny a sight as I ever witnessed. The old bear had taken out great pieces of comb and given a portion to each of the cubs. They were eating with a relish and licking their little mouths with delight. The old bear having, as a good mother, provided for her family, was eating greedily out of the cleft log, like a hog out of a trough.

Nevertheless, funny as it appeared, it was a sight we did not enjoy. Thad was a step or two in advance as we went through the hemlocks.

"Gracious!" he exclaimed, starting back. "See there now! I say, that's nice, ain't it?"

Catching sight of us at the same instant, the old bear left her feast, drew herself up, and turning her head to one side, as a bear will, gave a low growl, which plainly said she was ready to dispute our title to the honey.

She was, by all odds, the poorest, scrawniest old creature I ever saw. Her hair was rough and rusty; her hip bones stuck up; and there were great bare spots on her sides and flanks.

Though we did not have a weapon, we were determined not to give up that honey without at least one tussle for it.

"Get stones," said Thad. "I guess we can drive her off."

Setting down our pails, we picked up stones and pelted the bear, shouting and hooting at the same time. The cubs ran whimpering behind their mother, but she would not budge from the honey. Backing off a few steps, she made the woods resound with her savage growls, especially when we happened to hit her with a large stone. We threw all the stones we could pick up, but the old brute held her ground.

"Well, now, I'm not going to be beaten by any such looking old beast as that!" cried Thad, who by this time was greatly excited. "Cut some clubs, and let's see what we can do in closer quarters."

We cut two maple sticks, each as thick as a man's wrist, and three and a half or four feet long.

"Now you go up behind her," said Thad, "and I'll go up in front, and we'll see if we can't drive her off."

The bear snarled and showed her teeth, and as Thad came nearer, rose on her hind legs. Swinging his club with both hands, my friend dealt a heavy blow, but catching it on her paw,

Good Books to Read

MALLY, THE STORY OF A DOG,

Russell R. Cockburn.

The author is a well-known lecturer, author and sportsman. In boyhood he played hockey on every possible occasion, and has had all kinds of opportunities to study at close hand the lives of wolves, bear, elk, moose, and other game. So no one is better qualified to write Mally's story—Mally, a pure white husky, leader of a team of white huskies. Interwoven with the story is a realistic picture of life on the northern frontier.—The Macmillan Company, Toronto, Canada. \$2.50.

Good Movies to See

LITTLE ORVIE. An exciting story of "puppy love"—the love of a boy for his dog. Orvie has an awful time selling his folks on the idea that he should have a dog, but he does get his dog in the end—in fact, a lot of dogs. Loaded with laughs.

Giving

By Anne Murry Movius.

The joys I sought
Along the way
Passed me by
From day to day.

The joys I gave
O'erflowing measure
Are mine to hold
And mine to treasure.

the old beast sent the stick flying a dozen feet in the air.

She would have got hold of Thad if I had not run up and struck her such a blow from behind that she measured her length on the ground. But she was up again in an instant. The cubs

scampered.

Again seizing his stick, Thad rushed in for a second blow. The bear had turned on me, and this time Thad knocked her flat with a tremendous stroke on the head.

We could knock the creature down, but she would jump up before either of us could get in a second blow. We certainly knocked her over not less than ten or a dozen times, but we couldn't kill the creature—at least with those sticks.

At last she was sick of the battle and "mogged" off. We were quite willing to let her retreat, for we were both completely tired out.

If the old creature had fought much longer, we should have had to give up both the fight and the honey; and we might as well have given up the honey, for she had made a shocking mess of it.

Personal Problems

Height Isn't So Important

Dear Lucile: I have been going with a young man for about five months. He is one of the finest young men that a girl could wish for. Everything would be fine if it wasn't for one thing that bothers me very much, and that is that I am four inches taller than he.

I wear low-heeled shoes, but I'm still four inches taller, shoes and all. I just don't know what to do. Don't you think it would be rather foolish to quit him on account of that? I know it would hurt him terribly if I did.

Is it anything very much out of the ordinary, I being so much taller than him? I feel somewhat out of place when we are in public, just because of that.—*The Tallest.*

Does it make you feel any better to tell you that in three of the very happiest married couples I know the wife is a full head taller than her husband? I don't think height makes any difference, but if you're extremely sensitive about it, you might be unhappy, or hurt the feelings of your husband (if you married this young man) by showing your feelings.

You'll have to decide to be sensible about it, and let his good qualities so far overshadow his lack of four inches that you won't even think about it, or give him up now before the attachment between you grows deeper.

Wait Awhile

Dear Lucile: I have a boy friend that I love very much and he loves me, but he is awfully jealous of me.

If I dance with someone he doesn't like he gets angry. He asked me to give snubby answers when boys ask me for a dance, but I said I wouldn't do it, and then he thinks I like them better than I do him.

I am eighteen and he is twenty-two. We go to dances and always have a good time. He is a good manager and a hard worker. We both have lots of friends. Next year he wants me to be his wife. Do you think we should marry? What can I do about his jealousy?—*Jean.*

Since both you and this young man, who seems to be quite jealous of you,

"—And I hope I never, never see that husband of mine again, mother—did he 'phone?"

Bride Provides Linens

Dear Lucile: I am engaged to be married to a young fellow with a good income. Should I buy towelings, pillow tubing, etc., or should I let him buy them?—*Isabel.*

No matter how well off your fiancé may be, you should provide your own linens, if at all able. The girl or her parents should stand this expense. If neither are able, the young man may assume it, but it is an accepted obligation on the part of the bride.

Girl Speaks First

Dear Lucile: When I am walking down the street and meet a fellow I know, who should say "hello" first, I or the fellow?—*Wondering.*

When a girl meets a boy she knows on the street or in any public place, she should speak to him first.

Americanisms Defined

Don't read this until you have read "Test Your Americanisms" on Page 4.

1. Stupid — Blockhead.
2. To throw.
3. Out of temper.
4. A closet.
5. A careless, slatternly woman.
6. Talk too much.
7. Threshold of door.
8. Commonsense combined with energy.
9. To speak forcibly and with little sense.
10. Short space of time.
11. Not in good condition.
12. Soft-spoken; afraid to use one's mind or to use plain terms.
13. To imagine one has discovered something wonderful which in fact does not exist.
14. Moderately; fairly.
15. Idle talk; talk intended to wheedle.
16. Cross; ill-tempered.
17. Make angry.
18. Uproar.
19. No brains.
20. Uncertain.

American Agriculturist is more than a farm paper. It is an institution which serves agriculture in many ways. For a report of some of the things it has done, turn to page 5.

If Ruptured Try This Out

Modern Protection Provides Great Comfort and Holding Security

Without Tortuous Truss Wearing

An "eye-opening" revelation in sensible and comfortable reducible rupture protection may be yours for the asking without cost or obligation. Simply send name and address to William S. Rice, Inc., Dept. 71-P, Adams, N. Y., and full details of the new and different Rice Method will be sent you Free. Without hard flesh-gouging pads or tormenting pressure, here's a Support that has brought joy and comfort to thousands—by releasing them from Trusses with springs and straps, that bind and cut. Designed to securely hold a rupture up and in where it belongs and yet give freedom of body and genuine comfort. For full information—write today!

AMERICAN AGRICULTURIST

10 N. Cherry St., Poughkeepsie, N. Y.

Kernels, Screenings and Chaff

By H. E. BABCOCK

THIS is written on the eve of the Democratic convention in Chicago. By the time you read it you will know who the candidate of the Democratic Party is for the Presidency of the United States.

This is to record that I personally don't much care who it is. I make this statement because I have somehow arrived at the opinion that whether President Roosevelt is re-elected or another Democrat placed in the presidency, or, as seems quite likely at this writing, the White House is manned by Willkie, the course of this country, as far as its foreign policy is concerned, will not be materially affected.

I am of the opinion that the leaders of both parties have the same conception of what foreign policy is best for this country. As a result, they are going to have a hard time to pick an argument.

To implement its foreign policy, I believe this country will re-arm. *This is going to be an expensive irritating process which over the long pull will only be accomplished at the expense of our standard of living.*

For an inevitable lower standard of living we have Mr. Hitler and Mr. Mussolini to thank.

With no serious difference between the two major parties on foreign policy and rearmament, whatever political campaign develops will have to be fought out on domestic issues. These are important, but in the midst of a world war cannot be sufficiently dramatized to catch the public attention.

The inevitable result is going to be a campaign this fall between the "ins" and the "outs". Take your pick, but don't expect to go back to the conditions of the twenties whatever the outcome.

* * *

Farm Notes

I have previously reported that our ten acres of winter barley this year is a pretty poor crop. This barley, some of you may remember, is a barbless strain of winter barley, which has done very well in the Virginias and which I am trying out.

I switched to it because, while for several years we have had pretty fair crops of the so-called "Polish" barley, all the boys on the farm are very much set against this strain because the straw is so weak and because the awns are armed with such wicked barbs.

As yet, I have not seen a strain of winter barley which is satisfactory for hardiness, yield, strength of straw, and freedom from barbed awns. When the plant breeder develops a strain which combines these qualities, he will make a contribution to Northeastern agriculture.

* * *

This year we have bought less than fifty dollars worth of phosphoric acid for perhaps six or seven hundred tons of grass silage. We have gotten around

the purchasing of both phosphoric acid and molasses by mixing in winter grain in the dough stage when the hay we made into silage had a heavy percentage of legumes.

I feel that we can do this with safety where dairymen, particularly those making market milk, would have to be much more careful. If we run into some strong smelling silage it won't make too much difference to our dry dairy stock and our beef cattle; whereas a dairyman might be in serious difficulties and have his milk refused by the milk plant.

There is one kick, however, which will be registered if our silage smells strong. It will be made by the women of the house and, of course, it will be very effective. As a matter of fact, the most reliable test I know of for grass silage is a woman's sense of smell. If you can feed grass silage and then come up to the house and eat breakfast with your wife without her sniffing, you can rest assured that you are feeding a prime article.

* * *

We have quite a bunch of hay yet to cut, despite the amount we have made into grass silage. As a result our one hundred and twenty-five acres of small grain is bearing down on us pretty hard. Harvesting it with weather such as we have been having looks like quite a job.

We own a small combine and last year cut about half of our grain with it and about half with a rented reaper and binder. This grain we threshed ourselves, using a rented threshing machine from which we ran the straw into a chopper and blew it into the barn loft.

This season we have done considerable figuring on whether to combine all our grain or to reap and thresh part of it. We need every pound of straw we can save and there is no question but what combining wastes straw. We also had a lot of voluntary re-seeding on our combined pieces last fall, which makes it look as though we wasted considerable grain.

Largely due to the fact that the weather is so uncertain this year and that we may have to start grain harvest before we get through with our first cutting of hay, we have decided to rely on the combine entirely.

John, our youngest boy, will operate it. He has been down in New Mexico with his brother Howard where he has already cut quite a lot of grain, so that when he arrives at Sunnysables he should be well hardened into the job.

* * *

Incidentally, I am going to try out what may appear to be a fool stunt, looking toward next summer's crop of hay for silage. I am going to examine the ground of a certain winter wheat field very carefully after the combine has passed over it, and if there isn't quite a sprinkling of kernels in the straw, I am going to see to it that there is, so that I can get a volunteer crop of winter wheat in the new seeding on this field and thus, I hope, grow

a mixed crop which will make good grass silage without adding either molasses or phosphoric acid.

The reason I am trying out this scheme is because I know that the volunteer grain which came up in this year's new seedings increased the yield per acre and theoretically gave us right off the ground a perfect mixture for grass silage.

* * *

In February we started twelve hundred Leghorn chickens. Our records show that we lost substantially on the broilers, and this fact, combined with the high fuel cost for keeping the birds warm early this spring, make the pullets the most expensive birds we have ever raised. On the other side of the ledger, they seem to be the best birds we have ever produced.

On the first sort, five hundred were put into the laying house. They have been in two weeks, are quiet and contented, and only one has died. They are now laying about fifty per cent. Of the hundred birds left on the range, sixty or seventy will be good enough to take into the laying house, which means five hundred and seventy good birds at least out of a few less than six hundred pullets.

To fill up our laying pens we have four hundred more Leghorn pullets growing, and approximately two thousand Red-Rock crossbred pullets. These latter pullets should be well matured by Thanksgiving time, or even before. We are not committing ourselves to putting them into the laying pens even though they may be vacant, but will cheerfully sell them for meat if at any time they show us a real profit on

their raising cost.

Incidentally, these crossbred pullets will be raised on a specially seeded three-acre poultry range. This range was laid down this spring, and although the grass and clover made a slow start, it now literally covers the range as thick as the hair on a dog. Because of the abundance of tender grass and clover available to these fall crossbred pullets we hope to raise them on a lower protein, less expensive feed than we would otherwise give them, and less of it.

As we always do, we are chopping about half of the dry hay we cut. We have never been able to get our nerve up to the point of chopping all our dry hay, because to do so means that on some days we would put several feet of it into a mow within a few hours. What we like to do is to chop a few loads each day and gradually build up the pile. The above applies to first-cutting hay.

Because we need to get it into a place in the barn which can only be reached by blowing it there, we chop all our second-cutting hay. All of this hay, however, we cure in the cock. There is no finer feed on a farm than chopped, cock-cured, second-cutting clover or alfalfa.

* * *

The spayed Hereford heifer we are fattening for family use this fall is developing into a very sleek and good looking beef animal. While she still continues to grow, the twenty-two pounds of fattening ration she is putting away a day are beginning to broaden her out and make her look more like a fattening steer every day.

Down Mexico Way

By H. E. BABCOCK, Jr.

July 4, 1940.

AS YOU KNOW from the last issue of Kernels, Screenings & Chaff, Dad was here for a visit last week, bringing with him my brother John, who at the present time is celebrating the Fourth piloting the combine around our one hundred-acre oat field. We are breaking him in for the ten, twenty and thirty-acre fields which he will be called upon soon to combine at home.

It seems as if this column has largely been given over to the unusual rains which we have been having. Everybody here has given me credit for bringing them from the East, so I in turn will give Dad the credit for the three and one-half inch rain which came the night he left for Ithaca. As usual, the rain was greatly appreciated even though it caught us with about thirty tons of hay in the windrow. We have been fortunate in getting all of it in in the best shape possible after such a wetting.

The pressure was naturally let off the irrigating which we were pushing as fast as possible to get everything watered before it was injured by dryness. However, we are now forced by the need for cultivation. As a rule we keep irrigated only far enough ahead of the cultivators so that they can keep the moisture mulched in. The rain upset this whole plan and left us with two hundred and thirty acres of cotton, and ninety-five acres of wheatland maize in need of immediate cultivation. Since Monday morning the three four-horse teams have cultivated all of the maize and about twenty acres of cotton, and one team has stopped cultivating long enough to harrow fifty acres of maize just out of the ground.

Our one-hundred-acre oat field has ripened so rapidly and evenly that we have put two crews on the combine. Johnny and one man run from six A.M. until four P. M., at which time another crew takes over to run from then until the dew stops them, generally about one in the morning. At this rate we are combining an average of fifteen acres a day, despite the heavy infestation of Johnson grass which forces us to run at the slowest speed except for several hours each afternoon. This field will be pastured by our farm flock of four hundred and fifty ewes and lambs. Although the field has been seeded to sweet clover, the sheep will hunt out all of the Johnson grass before eating the clover. This will have the same effect on the Johnson grass as the geese, causing it eventually to starve at its roots.

It has been customary in previous years for farmers in this irrigated section to contract for their feeder lambs from outlying ranchers in June. This year, however, relatively few lambs have been bought as yet, most of the contracts running at seven cents. Everybody seems to be afraid to make a move now, and it seems at the present time as if even a seven-cent lamb would be a gamble. It is customary to pay the contract price for all lambs over forty-three pounds in weight and free from body wrinkles. Those cut back as being below weight or wrinkly go for a cent less. The above-average rains to date may suddenly change the whole lamb buying picture for it will mean cheaper feed costs for the farmer, and a better lamb for the rancher, a combination which should allow us to feed on a narrower margin.

Conducted by H. L. COSLINE

An Old Story

A few years ago I had to be at home with my parents most of the time. As I wanted to get a little pin money, I answered an advertisement for ladies to do fancy work at home. I had done this type of work for some time and sold quite a lot of embroidered, hemstitched and crocheted work. I knew that I had experience enough to do such work.

I received an answer from the company, saying if I would send \$1, they would send a sample of the work to be done; and that when I had done enough to amount to \$3, they would return the \$1 I had deposited. I sent the \$1, received five cotton handkerchiefs and the thread with which to work them. I was to do one and send it to be inspected. I sent it and received word back that it was not embroidered very well and that in doing the hemstitching I did not do the corners well. They could allow only 1½¢ for it.

I had done my best in working it, so I worked the rest of the handkerchiefs and used them. I suppose the company used the \$1 as I never heard from them again. That was experience enough for me. I no longer answer such advertisements.—Miss A. P., New York.

Warning On Bad Checks

Warning against worthless checks offered to farmers by truck-buyers comes from H. A. Spilman of the Massachusetts Agricultural Marketing Service. It is a good business practice to investigate all checks on out-of-state banks tendered by truckers, he says, even though the truck is licensed under the Perishable Agricultural Commodities Act.

"Investigating suspicious checks is a comparatively simple matter," Mr. Spilman points out. "The honest trucker will not object when he is asked to obtain the money by telegraph. And it is to the advantage of the farmer or dealer to pay for the telegram in order to be sure of payment. If the trucker is reluctant to wire for the money, it is a good indication that he has no money in the bank."

Under the Perishable Agricultural Commodities Act, any person handling one ton or more of produce in interstate or foreign commerce is a "dealer" and is required to be licensed by the Secretary of Agriculture. Most out-of-state truckers come under this defini-

tion and are subject to the penalties prescribed in the act.—W. E. Piper.

* * *

Short Weight for Chickens

"A few days ago two men with a truck and chicken crates came to my house. My wife was alone, and sold them 33 Leghorns which should have weighed around four or five pounds apiece. They only paid her for 70½ lbs. They set the scales, and she didn't realize what they had done until they had gone. She called a State Trooper and reported it. The license plate was white with black figures. The men were Italians or Jewish, and one had a 'hack' in his voice which was quite noticeable. We may not get what is due us, but I hope you will print this to protect someone else. I know I have profited from reading your Service Bureau column. It is a shame that the public has to get such treatment."—H. H.

It is difficult to see how 33 hens could give a net weight of only 70½ lbs. Added to that is the known fact that some buyers are quite willing to resort to trickery if they can get away with it. If a man answering this description should call on you, it certainly would appear wise to proceed cautiously if at all, to take the license number of the car, and, if any suspicious circumstances should develop, to notify your State Troopers.

* * *

Stove Tinkers

"The other day a man representing the _____ Company stopped at our house to repair stoves. He said it would cost me only for the material, which was \$3.62 a pound. The material was supposed to be ground steel, guaranteed for twenty years. As my stove needed repairing, I let him do it. It took 2½ pounds of material costing me \$9.05, which was a total loss."

"I thought you might like to advertise this in your paper as this man plans to travel around the entire United States doing this work. He claims to have been born in Rutland, Vermont, is dark complexioned, of medium height and weighs about 140 pounds."

To the best of our knowledge, none of the large mail order houses have men out doing this kind of work. In fact we have had many complaints about men who have represented themselves to be working for stove companies and the results have always been unsatisfactory to our subscribers.

Cattle Dealers License

In New York State the law requiring the licensing of cattle dealers has been amended. Any person, other than a farmer, buying or handling more than fifty head of cattle a year, must secure a license from the State Department of Agriculture and Markets at Albany.

If any of our readers know the whereabouts of Franklin E. Northrup, formerly of Tully, New York, we would appreciate hearing from them. Mr. Northrup is 55 years of age, weighs about 150 pounds, has brown hair streaked with gray, brown eyes, and is 5 feet 5 inches tall. Is smooth-shaven with a scar on left side of face.

* * *

Mother, 40, with 4 boys, ages 15, 14, 11 and 7, would like home on farm in exchange for services of herself and 2 oldest boys. Willing to pay \$30 per month towards board. Can give references. Mrs. J. C. M., care American Agriculturist, Savings Bank Building, Ithaca, N. Y.

* * *

Mrs. Mary E. Boynton, Topsfield, Maine is most anxious to communicate with Mr. Franklin B. Hawkins, born at Grand Lake Stream, Maine, now working in New York State.

Suffered Dislocated Vertebrae When Car Crashed on Curve

Felix H. Green, Wolcott, N. Y.

Mr. Green Writes:

"I wish to thank you for the check of \$130.00 in full settlement for the injuries I received in the automobile accident.

"I was laid up for thirteen weeks and I am glad to be about again. This check will be a great help in paying the doctor bills."

THIS low-cost travel accident insurance protection pays \$1,000.00 for loss of life or \$10.00 a week for as many as thirteen weeks while totally disabled, if you are injured in an automobile, truck, public conveyance or pedestrian accident as specified in the policy.

25.00 FRAUD REWARD—American Agriculturist will pay \$25.00 for evidence leading to the arrest, conviction and imprisonment for at least 30 days of any person or persons who defraud or attempt to defraud on the premises an AMERICAN AGRICULTURIST subscriber who has Protective Service Bureau Sign posted on his premises at the time such fraud is committed. Claim for the reward must be made promptly, not later than the date of conviction. Reward does NOT apply to conviction for theft.

American Agriculturist guarantees fair treatment of subscribers by advertisers. We refuse many ads known to be unreliable but if a fraud slips in, you are protected. To take advantage of guarantee, subscribers must say, "I saw your ad in American Agriculturist", when writing to advertisers, and then report unfair treatment promptly to Service Bureau.

Membership in the Protective Service Bureau is confined to our Subscribers. Free service rendered members consists of the adjustment of claims, collections of obligations owed by supposedly reliable business concerns (does not include obligations between individuals or any claim that is more than 6 months old); and any inquiries a subscriber may make concerning the problems of farming or home making. Address all letters to Service Bureau, American Agriculturist, Savings Bank Bldg., Ithaca, N. Y.

THE G.L.F. PATRON

The basis of a sound business cooperative is voluntary use by fully informed patrons

The committee organization meeting following the Dryden G.L.F. Patrons Annual Meeting. Around the table, starting at the left of the picture: Clayton Bowker, Carl Mott, J. C. McKinney, Ernest Cotterell, Fitts Monroe, H. C. Tripp.

Making Democracy Work

THESE PICTURES were taken at the first G.L.F. Patrons Annual Meeting held this year—in the High School Auditorium, Dryden, N. Y., on Monday evening, July 8. G.L.F. Service for the farming community of Dryden is handled through the Farmers' Feed & Milling Co., G.L.F. Agent-Buyers.

In spite of the fact that Monday was the first good haying day Tompkins County has had this year, and everybody worked late to take advantage of the weather, about 120 came to the meeting that evening.

Getting ready to elect committeemen at the Dryden G.L.F. Patrons Annual Meeting

They heard reports on the year's business, saw two interesting movies, received patronage dividend checks, ate ice cream, and enjoyed themselves generally. The most important thing they did was to elect two men—Carl Mott and Ernest Cotterell—to serve on the Patrons Committee for the next three years.

The Patrons Committee is the link between G.L.F. users and G.L.F. management. The committee functions in two ways: (1) working directly with the management of G.L.F. and of the local Service Agency in securing for its community the right kind of service; (2) participating in the election of directors at the G.L.F. Stockholders Annual Meeting.

The Patrons Committee is the means by which G.L.F. patrons insure that this cooperative will always be run in their interest. The careful selection of committeemen is, therefore, a serious responsibility. It is a responsibility that G.L.F. patrons must accept in the maintenance of democratic control of their institution.

G.L.F. EXCHANGE, INC.
ITHACA, N. Y.**

Egg Premium Maker

The G.L.F. Patrons Purchasing Guide, published last spring, announced that G.L.F. was experimenting with an egg cooler and humidifier. This cooler and humidifier, called the G.L.F. Premium Maker, will soon be available through G.L.F. Service Agencies at about \$15.00. Farm tests show that it cools eggs quickly without loss of moisture, increasing the return to users. Further announcement in an early issue.

Strike at Buffalo

The usual prompt and efficient service on poultry and dairy feeds from the G.L.F. Mill at Buffalo has been interrupted the past week by a strike of the mill-workers. The other G.L.F. mills were not affected.

Dusting the Potato Patch

THOROUGH COVERAGE of plants is the most important thing in dusting or spraying. That this can be achieved on small areas as well as large is shown by the picture below, taken in Robert Hoose's field of potatoes at

Virgil, N. Y. The plants (Katadins) were about four inches tall and just the right size for the first dust application.

The dusting was done with a Unico Model H, Fan-Type Hand Duster, available at G.L.F. Service Agencies. An acre of potatoes was dusted with forty pounds of G.L.F. 60-20-20 Lime-Monohydrated Copper Sulphate-Calcium Arsenate Dust in one hour and fifty-seven minutes. Cost of dust, \$2.00. Mr. Hoose plans to make four or five more applications before digging time.

THE FARM PAPER OF THE NORTHEAST

A Vagrant Automobile Cruise in the DEEP SOUTH

I DO NOT believe that there was anything especially significant in that we happened to choose All Fools' Day—April 1st—for embarking on an automobile ride whose set objective was New Orleans and the Louisiana Sugar Bowl. Now by "we" I mean our comfortable little family party of my wife and myself but not for a moment forgetting two of our daughters. Possibly it may be pleasant to go on a voyage of discovery all by one's self. However, if a man is properly married he can hardly conceive of leaving his wife behind when on pleasure bent, and when in addition he may include some of his children his cup ought indeed to overflow. These two girls have been out of the home nest so many years that

fifteen nights and had fourteen different sleeping places, which indicates that we made steady progress. We traveled just under 3800 miles and so it would appear that our daily mileage was not unreasonably long. The total distance was considerably more than the shortest possible route because we veered to the east going down, and on returning went considerably further West than haste would advise. Mornings we started out soon after seven o'clock and it is our settled custom to make twenty or perhaps thirty miles before breakfast. This is for us a sound practice because neither the housewife nor the dairy farmer is habituated to eating breakfast until after an

By Jared Van Wagenen, Jr.

happened that we spent three nights in cabins, four in hotels, and the others in homes. Our experience on various trips has convinced us that the usual small-town hotel (and by "small-town" I mean up to cities of several thousand inhabitants) is frequently a pretty grim and dismal abode. Of course a modern hotel in a good-sized city leaves very little to be desired. We are rather fond of the better type of tourists homes. There are now a good many fine modern homes which have learned to offer excellent over-night accommodations to the paying guest. Not infrequently we have found two rooms with a connecting bath. For me one of the advantages of the home lies in the fact that I am afflicted with an insatiable curiosity con-

(Turn to Page 8)

long intimate days of companionship gave us an opportunity of getting acquainted all over again. While we were definitely committed to seeing a few special places in Louisiana and Mississippi, we left home with the distinct understanding that we had no definite route laid out, that we had hardly the glimmer of an idea as to where we should spend our nights, and that we would come back at a date to accord with the dictates of our own conscience. As a matter of fact a man and his wife whose activities during many years have been centered around a busy farm and home will after a little find it impossible to still an accusing inner voice that bids them return to take their part in the workaday round.

It turned out that we were away from home

hour or so of activity. When we felt like it we stopped to rest and frequently turned off for side trips. At noon we ate a picnic lunch, our favorite place for this being under the oak trees that shelter some wayside church, with a cemetery hard by where I may wander among the slabs and read the epitaphs. When the sun dropped low and supper time drew near we looked for a place to lie the night. It

WHERE IS THE MILK SURPLUS? — SEE PAGE 4.

“— and Son”

By H. L. COSLINE

FRANK H. ROSE of Hobart, Delaware County, N. Y., was right at home when opportunity knocked. What's more, he was wide awake. He not only opened the door, but grabbed opportunity by the coat collar and has been hanging on ever since.

I pause to remark that the “H” in Frank's name is important as a distinguishing mark. His Dad's name is Frank S.—so, strictly speaking, we can't call the son Junior—a fact which complicates the matter of identifying them to you.

When Frank the younger went to Cornell in 1932 for a two-year special course in agriculture, he had the rather common uncertainty of young men of that age as to his life's work. Before he had finished, he had reached the definite conclusion that the biggest opportunity he had was right on the home farm. It would have been easy to decide that the home farm was too small for a father and son partnership. Mr. Rose had been milking from 25 to 30 cows and growing his own replacements. On his 164-acre farm, dairying was the principal, in fact only, important source of income. The first definite decision toward a farm partnership between the two Franks was not to buy more land.

“It was my belief,” said the son to me, “that there was plenty of opportunity for two men on a properly organized farm of that size. The next question, of course, was how to increase the income. It didn't take us long to decide that the addition of a good sized poultry flock was the proper move. I was sure that we could take care of a flock of hens without much additional help and that we could add a poultry flock without doing much building.

Housing Hens at Low Cost

“In 1934 we remodeled our barn to carry 600 hens on two floors. We kept down the cost by doing some of the work ourselves, and when the hens were ready to go in, we found that we had invested 45¢ a bird in housing. In 1936 we did some more remodeling to hold 650 more at a cost of \$200. In a year or two now, we plan to make some more changes to handle another 650, and all of the new construction we plan to do is to build some more brooder houses.”

“Of course, you have had to cut down on your dairy herd,” I remarked, “as you have added hens.”

(EDITOR'S NOTE: A year ago this summer I attended a Delaware County tour, and one of the stops was at the farm of Frank Rose. I found so much of interest on this farm that I recently asked permission to report to our readers the manner in which this father and son partnership is operated.—H. L. C.)

“On the contrary,” Dad Rose replied, “we now have a total of 60 head of stock and try to milk about 37. What is more, we are figuring on having plenty of hay for them, plus the best pasture we can grow. Although we have taken some room out of the barn for hens, we still have a hay mow that will hold 100 tons of hay, and this summer we are putting up a silo primarily to hold grass silage. It is 13 ft. in diameter and 34 ft. high. We are growing some corn and soybeans this year, but eventually we plan to grow no corn and will depend entirely on grass silage and hay.”

Pastures Are Fed

A few inquiries brought out the following facts relative to pasture and meadows on the Rose farm. A 16-acre pasture that was once an old meadow has been treated with superphosphate every year, plus liberal applications of chicken manure. These 16 acres will carry 25 head of cattle most of the year and 15 even in the driest part of the summer. Four years ago another piece of pasture was plowed up, cropped, and then seeded, and will go back into pasture again this year. Adopting the policy of “making the best better,” the more fertile parts of pasture have been improved first, and then as time allows, superphosphate is being added to the “back pasture” which is naturally a bit less fertile.

So far as hay is concerned, it is just a question of raising more hay on the same land. Mr. Rose says that in all his experience on a dairy farm, he has never purchased a forkful of hay. In 1938, the hay yield was three tons per acre. Last year, because of the dry weather, the yield per acre was less; but even so, it was unnecessary for any cow to look at a manger empty of hay with one eye, and

SUMMER MAGIC

By Eleanor A. Chaffee.

The flavor of cherries, ripe with Spring
And warm with sun, is a pleasant thing.
A peach with a cheek like a garden rose
Is the taste of everything sweet that grows.
And berries found in the meadow grass
Seem like jelly in crystal glass.

But the wild plum has a strange, sharp tang
Like the words that a passing gypsy sang,
And one who finds it will go again
Though he has to seek it in falling rain.
There is a magic that calls him back
To the tree grown far from the beaten track.

Strictly speaking, the term father and son partnership as applied to the Rose family is incorrect because Mrs. Rose is an important factor in the successful operation of the farm.

at the same time cast a reproachful glance at the boss.

Every day 1 lb. of superphosphate per cow is used in the stable and a comparable amount in the poultry house. Because the farm is so heavily stocked, it is possible to manure every crop field every year, with enough manure left over to spread on about 5 acres of pasture.

It Pays to Save Steps

“It is my belief,” said the son, “that the regular farm help can handle an almost unlimited amount of livestock if chores can be arranged so that they are done without any back-tracking. It has been our aim to arrange our routine so that we do what is necessary with the fewest possible steps, and I think we have succeeded quite well in doing that.”

“It must be a great satisfaction,” I remarked, “to see a place grow in fertility and in its ability to carry livestock.”

“It certainly is,” was the reply of the younger man, “but really we have only made a start. I can see a great many things that need doing before the farm is in the shape we hope to see it. For example, in the last year or two we have cut a lot of brush, and there is plenty more of that kind of work to be done.”

The partnership between Mr. Rose and his son was not entered into immediately when Frank came back from college in 1934. He worked with his father for two years, and it was not until 1936 that they became equal partners. In fact, there are certain legal aspects of a farm partnership that are still troubling them. To incorporate as partners requires a cash outlay which seems scarcely justified, and as a result the arrangement is what might be termed a gentlemen's agreement, with a major part of the profits up to date being plowed back into the farm.

“For example,” said the son, “our farm equipment in 1934 was not in the best of shape. In the first place, farming has been changing rapidly so that some of our equipment was out of date and much of it was old. Since then, we have gradually added to our machinery, and now it is in tip-top shape. In fact, what we are doing is to put ourselves in a position to stand a little bad luck if such should fall to our lot. If a storm comes, we figure we can ‘ride it out.’”

Records That Tell Facts

The bookkeeping on this farm is designed to give the information needed without making record-keeping too much of a burden.

“We keep complete cost accounts on the poultry flock,” said the younger man.

“That is a term that needs a little more definition,” I said. “It might mean one thing to one man and something else to another. For example, from your records can you tell me your average egg production, what it costs you to produce a dozen eggs, and the per cent of mortality in your laying flock?”

“Yes,” was the unhesitating reply, which was to me satisfactory evidence of the correctness of the answer.

Over the years, egg production has improved, mainly because, as Frank said, “What is the use of keeping hens unless you learn something about them every day? Last year we sold 16,000 doz. eggs, and in the season of 1938-39, we actually sold an average of 169 eggs per hen.”

Records on the cows are kept by means of a membership in a Dairy Herd Improvement Association. The average production is 5,600 lbs. of milk and about 275 lbs. of fat.

“We are not too proud of the record of the herd,” said Frank.

But I was inclined to disagree with him. For a herd of Jerseys, I think you will agree that that is above average.

One of Mrs. Rose's worries is that her son is working too hard. To me this concern shows two things—first, that her son is so interested in the farm that each day is too short to do the things he wants to do; and, second, that the partnership has its spiritual as well as its economic side. (Turn to Page 20)

Your Questions Answered

Take Care of Dry Cows

I have noted from dairy improvement records a tendency for some of our best cows to do better in alternate years. Is there any explanation for this, and how can it be prevented?

PROBABLY the tendency to produce better in alternate years is caused by a failure to dry the cow off early enough during the high-producing years so that she will have a good rest and get into first class condition before calving. It takes a good deal of care and study to feed a high-producing cow so that she will consume enough

soybean oil meal. Alfalfa and clover are high in calcium content, and wheat bran and cottonseed or linseed oil meal are high in phosphorus. These two minerals are the ones most needed to replace minerals lost during the period of high production. For a week or so before the cow freshens, particularly if her udder tends to be congested, it is a good idea to feed her a bulky, cooling laxative mixture. Either ground oats and wheat bran or wheat bran alone will be satisfactory.

The good cow that has been well fitted before freshening will get off to a good start without drawing further on her body reserves, and will continue to produce during her lactation period without the necessity of excessively heavy feeding.

Let the Specialist Make the Spray

Is it possible to make a fly-spray at home? Is it practical from the standpoint of cost and convenience?—G. E. F., New York.

Yes, it is possible to prepare a home-made fly-spray. But it is no easy task and unless "you know your chemicals", as the saying goes, you may run into difficulty. Therefore, we believe that it is not practical. Commercial sprays, made by reliable manufacturers, cost but very little more and are infinitely more convenient. You can be sure that the material, if applied as directed, will not cause injury. Homemade sprays have been known to create a lot of harm. The reliable manufacturer has his chemists working constantly improving mixtures that will control more effectively, insect pests attacking livestock. He is able to obtain materials that the individual would have difficulty in locating in small quantities and at an economical price. It simmers down to letting the specialist do the experimenting, while the dairy and livestock man gets rid of the flies in the quickest and most effective manner.

The importance of sprays is not only in the manufacture. It is equally important to know how to apply them. Drenching a cow with spray may not be the answer, and may cause trouble

ROSS CADY of Skaneateles Falls, Cayuga Co., N. Y., putting the teat cups on one of the 125 dairy cows on the Glenside Poultry and Dairy Farms. The Syracuse dealer who buys the milk requires a minimum production of 30 cans of milk a day, although at some seasons production goes as high as 40 to 45 cans.

The farm area is 850 acres, of which 180 acres are in corn. Surrounding the barn in which this picture was taken are six silos with a total capacity of 1400 tons of silage, and on another farm there are three more. A lot of grass silage has been put up, and Mr. Cady doubts if the remaining space in the silos will take care of the corn crop this year.

This year the farm has grown 50 acres of canning peas, and housed above the stable are 1200 laying hens.

nutrients to supply her needs for milk produced.

A good cow will use up her body tissue and the minerals in her bones to supply any deficiency. We all know that it is difficult to dry off a high-producing cow, and if she is not dried off until six weeks, four weeks, or even less, before she freshens, she has no opportunity to get into condition. If she is given a two-month rest between lactation periods and if she is fed adequately, she will build up her body and be ready for another year of good production.

It has often been said that grain fed to a dry cow returns more profit than that fed while she is producing milk. It is well to remember, however, that a dry cow may be in good flesh without having built up the mineral reserves in her body. In feeding a dry cow it is important to give her either abundant amounts of good hay and silage or excellent pasture. However, roughage alone will not do the trick. A good fitting ration can be made up of 100 lbs. of corn, hominy, or ground barley; 100 lbs. of ground oats; 100 lbs. of wheat bran; 50 to 100 lbs. of oil meal or

Better Flint Corn for Grain

AT THE right is a picture of some strains of flint corn growing at the New York State College of Agriculture. Shown in the picture is Professor R. G. Wiggans who is searching for a better flint corn with the thought that eventually a double-crossed flint corn may be bred. When the picture was taken, Professor Wiggans was explaining the work on flint corn to a group of seed growers who recently visited the college.

You may remember that in the April 13 issue of *American Agriculturist* there was a story headed "Wanted — A Double-Crossed Flint Corn." At that time our readers were asked to send seed of strains of flint corn to Professor Wiggans. Many of our readers did so, and as you will see from the picture, this year's work is well under way. Also,

there were offered prizes of \$15 for 1st, \$10 for 2nd, and three \$5 prizes to the senders of the strains which gave the best yield on this summer's crop. Those prizes, of course, can be announced only after the growing season is over.

You will also be interested to know that in addition to giving the prizes,

the American Agriculturist Foundation supplied \$150 to defray the expense of running the yield tests this summer. The profits from *American Agriculturist*, after expenses are paid, are used by the Foundation for the advancement of education of farm boys and girls and for research in agriculture.

even though the spray itself is harmless. Remember, a layer of oil acts like a blanket. Under a blazing sun this blanket will raise the cow's temperature and perhaps blister. That is why sprays should be put on with a sprayer at high pressure, in the form of a mist.

Vaccinating Pullets

"Is it wise to buy pullets that have been vaccinated for infectious Laryngo-Tracheitis and put them with pullets that have not been vaccinated?"

In this case the answer is definitely no. There is a distinct possibility that some of the vaccinated birds may be carriers and will spread Tracheitis to other hens on your farm. Probably this is caused by the fact that some of the vaccinated birds may not have taken the vaccine 100%, and therefore, de-

velop a natural infection of the disease, which because of the partial vaccination does not affect them seriously, but may make them carriers. In other words when vaccinating for Tracheitis, it is a question of all or nothing. If you are going to vaccinate, vaccinate every bird on the place.

Taken on July 18, this picture shows one of best fields of corn I have seen this year. This particular field shows 6½ acres of 29-3 double-crossed silage corn on the farm of Charles Riley, Sennett, Cayuga Co., New York, with shirtless, 13-year-old Norman Riley acting as a measuring stick to give you something with which to compare the height of the corn. This field was plowed this spring, the corn was planted May 16, and has been cultivated twice with a weeder back of the cultivator.

Because of the poor hay weather, a lot of grass has been put in the 14 x 48 ft. silo on the Riley farm, and it looks as though there will not be room in the silo to handle the entire 16 acres of corn on the farm. The Rileys have about decided to put up a new silo before silo-filling time.—H. L. C.

Growing Early Potatoes on Muck

LUCIAN MARTENS of Port Byron, New York, with some Irish Cobblers that have just been dug on muck. These potatoes were planted about April 8, and were fertilized with one ton of 4-8-12 per acre. They were dusted once, and are being dug on July 18. Estimated yield—300 bushels to the acre.

Literally these potatoes are dug by hand without the use of a single tool. The vines are pulled and most of the potatoes come along with them. Then a little exploration by hand in the loose, friable muck brings out the rest of them. There are two reasons for digging this way. First, the heavy vines would interfere seriously with a potato digger; but more important is the fact that

the potatoes are so green that a digger would skin them up very badly. These potatoes were on the Syracuse Regional Market the next day after they were dug.

THE *Editorial* PAGE

BY E. R. EASTMAN

Address all mail for Editorial or Advertising departments to American Agriculturist, Savings Bank Building, Ithaca, New York.

*"The weary sun hath made a golden set,
And by the bright track of his fiery car
Gives token of a goodly day tomorrow."*

—Shakespeare.

Where Is the Milk Surplus?

EVER since dairymen began to sell fluid milk there has been groaning and grunting and complaining about the surplus. And rightly so, for usually a small percentage of surplus has been used as an excuse to bear down prices to farmers of all the milk, often to starvation point.

But this year, with more milk produced than ever before in the history of the industry, I haven't once heard anyone say anything about surplus. One man said to me the other day: "Where is the surplus?" There is none! Why? Because we have a surplus plan that is working. That is the classified plan and the Federal and State milk marketing agreements. Every pound of milk that the consumer will take in fluid form he gets, and every farmer gets his share of that fluid market for the first time that I have ever known.

The same goes for the other classes. Of course if farmers produced less milk, less of it would have to be sold in the lower classes and the final price to farmers would be correspondingly greater. That's a lesson we have yet to learn.

Another proof that we have a real surplus plan is the price. For the first six months of 1939 farmers in the New York City milk shed received a total of only \$39,378,592.63. During the same period this year farmers received for the same volume of milk \$60,906,773.49 or nearly twice as much. They really received much more than this, because they produced more milk the first six months of this year than during the same period last year.

We of *American Agriculturist* rejoice that we had some part in encouraging the organization and securing of the marketing agreements that have brought about these better milk prices, and what is more important, we rejoice in what this increased price means in more happiness to farm folks.

"Controlled Atmosphere" for Apples

REMEMBER with what pride you kept over a bushel or so of some variety of apples like Russets and passed them around in late Spring. You bragged both about your good cellar and the keeping qualities of your apples.

Well, cold storage has lengthened the season for apples as well as for everything else, so that a good apple in June is no longer a curiosity. Now the latest development of the past few years in keeping apples is "controlled atmosphere," described several times recently in *American Agriculturist*. With it, it will soon be possible to put fresh, juicy apples grown the fall before on the market right in the middle of summer.

At Cornell, where these experiments are under way, last year's McIntosh apples are still in storage, and will be shown at the New York State Fair this year. In May a truckload of these apples was shipped from Cornell to New York City, and brought \$2.25 per box of 1 1/8 bushels, top price.

"Controlled atmosphere" is produced in an air-tight storage room with just the right combination of carbon dioxide and oxygen, and a temperature of 40° F. The apple itself furnishes its own chemicals. It takes in the oxygen and gives off carbon dioxide. The "control" occurs by keeping just the right amount of carbon dioxide. If

this plan works out in a practical way, as now seems to be indicated, it will add tremendously to the consumption of apples, therefore to the marketing and price possibilities for growers.

Good Crops!

IT IS A privilege to ride up and down the northeastern country this summer and see the luxurious hay, grain, and other crops. With the exception of corn, I have never seen them looking better. It has been a little too cold and wet for corn, but I never worry much about corn if there is a good stand to start with. A few warm nights and behold, it always comes through. For corn is King in America! I heard a fellow say after the first hot night of the season, that his corn grew so fast and made so much noise he couldn't sleep.

Best of all, indications are now for fair to good prices. So don't worry too much if the rain spoils a little of your hay, and makes it difficult to get work done. It is making up to you in other ways. A wet season is better than the dry one we had last year.

Food Exports Not Important

TOO MUCH emphasis is placed by American farmers on the importance of our export trade. Recent figures published in *Farm Economics* by the New York State College of Agriculture show that exports of food represented 6.7 per cent of the total income that farmers derived from sales of food in 1885. This proportion had declined to 1.8 per cent in 1935.

To be sure, exports of cotton and wheat have been sizeable until recently, and hence there is a real problem for producers of those two commodities in the loss of the export trade. The small amount of our exports, and of our imports, also proves that America can, if it wishes, be

practically self-sufficient. We will have to learn to make some adjustments, which will be hard for some people; we will have to learn to find more substitutes, and we are doing that rapidly.

One of the best answers to our surplus problem, and to the loss of export markets, is chemotherapy, which simply means finding more and more commercial uses for the stuff we grow.

Shadows

EVERY sunny morning when I get up I look for the shadows laid by the great elms across our acre lawn. And again in the late afternoon I watch the shadows from the elms on the other side of the lawn. Laced by the beams of sunshine coming through, and contrasted by the deep green of the grass, those long shadows are calming and beautiful, far removed from the sorrow, toil, and turmoil of the world.

As I watch those shadows, I journey back in memory to other summers, to late afternoons in haying and harvesting. Father, brother and I would be coming in, perhaps with the last load of hay; Mother would be sitting on the farmhouse porch sewing, or preparing vegetables for supper; and the house and trees would be laying their long shadows across the yard. Casting ourselves down in the welcome shade, we would have a few moments relief from the heat before it was time to get the cows and start the milking.

Sunshine and Shadow are part of Life itself. One supplements the other, and their contrast increases our appreciation of both. As I think of the shadows of Life, I recall the loved ones who are gone, and Whittier's "Snowbound", where he says:

"We tread the paths their feet have worn,
We sit beneath their orchard trees,
We hear, like them, the hum of bees
And rustle of the bladed corn;
But in the sun they cast no shade,
No step is on the conscious floor!"

And I call to mind, too, that other reference to shadows in Henry Van Dyke's beautiful little poem called "My Work":

"Then shall I find it not too large, nor too small
To suit my spirit, and to prove my powers;
Then shall I cheerful greet the laboring hours,
And cheerful turn, when the long shadows fall
At eventide, to plan and love and rest
Because I know for me by work is best."

Danger

REPORTS from many of my friends from New York and New England indicate that often as much as \$125 to \$150 is now being paid for grade cows, because of better milk prices. At the risk of "leading with my chin" I say that there are few grade cows on earth that are worth much over \$100, and that dairymen who build up a dairy on that basis are rapidly becoming overcapitalized and are riding for a fall.

Eastman's Chestnut

ONE OF my friends, a College of Agriculture extension worker in one of the southern states, was instructed by his wife to get her some turkey eggs to set. On one of his trips soon after, a boy asked him if he wouldn't like to buy some buzzard's eggs. Here was a grand opportunity to play a joke on his wife, so he bought the eggs and took them home.

A few weeks later he asked his wife:

"How are your turkeys getting along?"

"Oh", said his wife, "I decided it was getting too late to hatch turkeys, so I just put them in your lunch box!"

PARTNERS.—Patricia Oakley, 4 years old, with Belgian twin colts owned by her father, Gordon Oakley, of Rushville, New York. It is very rare for twin colts to survive.

Dangers of a Third Term

I THINK the third term for an American President is wrong, whether attempted by a Democrat or a Republican. Although I was an ardent admirer of Theodore Roosevelt, I was against him as a matter of principle when he attempted to run for a third term. So were millions of others and he was defeated.

The third term is wrong because it is dangerous to our American institutions. The American President has more powers than any other ruler in the world with the exception of the dictators. During the emergencies of recent years his powers have been greatly increased. The safeguard is to permit no one man to hold this high office too long or else we will have a dictatorship here.

To say that out of 130 million people there is no other man capable of acting as President is nonsense. There are many. Secretary Hull is one. He is a great statesman and a fine gentleman. It is he who originates and carries out most of our present foreign policies. As President he could have continued to do so.

President George Washington said a third term was wrong, and although he was the unanimous choice of the people he refused it, believing that a third term would lead in America to one-man rule, and to the very thing against which the Revolution was fought. President Thomas Jefferson, who first laid down some of the principles that have helped the Democratic Party to survive through the years, refused nomination for the third term, believing it was not in the interests of true Democracy.

In a public lecture recently, a naturalized citizen, a highly educated man, said he had come to America, Land of Opportunity, because it was a government of principles and not a government of men. "European governments", said he, "are governments of men. But now I am much worried because I can see a strong tendency in this great country to turn away from its government of principles toward the European idea of a government of men. When that happens, Americans can say goodbye to liberty."

A third term is a strong trend toward a government of men, and away from a government of principles!

Now, that is what I think. What do you think? *American Agriculturist* tries to get both sides, therefore these columns are open, so far as our space will permit, for letters on either side of the third term issue. Sign your name but only initials will be published. Make your letters as short as possible, discuss the third term as a matter of principle, keep away from partisan politics and personalities. Address your letters to me, editor of *American Agriculturist*, Department T, Savings Bank Building, Ithaca, New York.

Something to Think About

THE DICTATORS of Europe claim that the democracies are failing because they have grown soft, because the constant demand for shorter hours, more pay, more leisure, security guaranteed by the government, and luxuries have resulted in weakening the character of the citizens of the democracies. Hitler points with pride to the fact that hard work, long hours, sacrifices by his people are fast making his country the most powerful nation on the globe.

I do not believe that any individual, institution, or nation can long succeed on a doctrine that "might makes right". History testifies, however, to the fact that too many luxuries, too much leisure, will ruin any person, any institution, and any nation. No people on this earth ever had less or accomplished more than the American pioneers.

You Can Grow Blueberries

WITH the possible exception of strawberries, I think that blueberries are the most delicious berries grown, good for canning, for grand blueberry pies, and to eat fresh. The real blueberry is comparatively free from seeds, but the huckleberry has ten quite large, hard seeds.

Several states of the Northeast are growing blueberries commercially and making a success

of them, for the market demand is excellent. But the soil requirements are difficult, and a farmer would want to make sure his soil was right before he started to grow blueberries on a large scale.

On the other hand, almost any gardener by taking some extra pains can have blueberries for family use, and the delicious fruit is well worth the extra care. The soil must be very acid or sour, it should be light texture, and there must be plenty of moisture. To get an acid soil it has to be chemically treated. The process is not difficult. Write to your Experiment Station or College of Agriculture for bulletins on blueberries. The Experiment Station at Geneva, New York, has an excellent bulletin on the subject. Study the bulletin, and plan to add to the joy of living by having some blueberries.

Should Eastern Farmers Raise Horses?

TO THE question in the title, the answer is **YES**. New York farmers, and the same principle applies also to New England, buy from 20,000 to 25,000 horses each year. Most of them are brought in from Canada or the West, and are not high-grade stock.

New York State College of Agriculture points out that farmers may safely expand their horse production up to the point of filling the need for replacements. Why not have a good colt or two coming along? In the State of New York there are 542 draft stallions registered with the Department of Agriculture and Markets. Two-thirds are purebreds, and one-third grades. Average service charge for purebreds is \$15, \$10 for a grade. The extra \$5 is usually worth many times its cost.

Readers Talk Back

FAITHFUL HORSES

The following lines had their inception in an *American Agriculturist* article a few issues back, which told us about the faithful team of grays, Mike and Mag. I had occasion to prepare some thing for a farm and horse show program. The article about Mike and Mag recurred to my mind, and I put these lines together. The love and sentiment for the faithfulness and loyalty of farm and other work horses will ever remain with many of us.

When Jim and May Took in the Fairs

Old Star and Buck of genus ox
Plowed the fields and hauled the crops.
Horses then, like Jim and May,
Turned the sod and raked the hay,
Took the folks on jaunts around
To visit neighbors, shop in town.
On Sundays off to church they'd pull
And some days hauled the kids to school.
When Fair Days came, away they'd go
With all the family to the show.
No prize was won by Jim and May
And other horses such as they,
But homeward bound, full well content,
They jogged along with fixed intent
Upon the meal of grain and hay,
Most cherished prize on any day.

—William C. Perez,
Branchville, N. J.

YELLOW ROCKET CONTROL

Some 15 or more years ago a local mill offered for sale re-cleaned wheat screenings feed, unground samples of which were shown to prospective buyers, which seemed to contain nothing but small wheat and wild buckwheat. Arguing the question at the mill of soil infestation with weeds by using the feed, I was told that nothing would grow that went through their mill.

The screenings in the bin compared well with the sample, and sold for about \$10.00 per ton less than other grain feeds commonly used.

I used the feed and spread the manure therefrom on first cut meadows in late summer. We had no experience with Yellow Rocket at that time, and its appearance and gradual spread on these meadows in subsequent years did not alarm us. The seeds had matured before the grass was cut and was carried to the loft and fed with the hay and thus in-

"Let the farmer forever be honored in his calling; for they who labor in the earth are the chosen people of God."

—Thomas Jefferson.

How Long Can We Stand It?

"Every third family in the United States, representing 11 million families in all and 26 million people, draw all or part of their income directly from the United States Treasury."

—Small Business Men's Association.

BUT THAT is not the whole story, because you have to add the many more millions who get their income or relief money from state or local sources.

In thinking of this terrific tax burden upon agriculture and business, I wonder how long we can stand it, how long it will be before all the rest should quit their jobs and go to work for the government.

Why Pasture Grass Was Poor This Year

FARMERS continue to report that while pasture has been luxuriant, cows don't do very well on it. One farmer told me what I think is the solution. He said the trouble is that the grasses grew so fast that the cattle didn't keep them down, so the grass was poor in quality not because of too much water in it, but because it was too ripe.

Clipping when grass got high, would have prevented this. Thousands of farmers are now finding that it pays, where the ground will permit, to run a mowing machine over the pasture.

festated other fields where the manure was spread.

While it seems to diminish on the new meadows, it does not become extinct, and has reappeared in the new meadows with a prodigious increase. It is our experience that the weed will yield to persistent clipping when first in bloom, while the plant stands erect, and the grass is small. With a second cutting in haying and the drought that followed last summer we have our yellow rocket reduced this spring to the point where one man with a scythe clipped every visible plant on 100 acres clear land in one day. Most of the land is clean.—F.W.K., N. Y.

BIG STRAWBERRY YIELD

We are reporting what we think an unusual yield of strawberries. On an area 2½ x 10 yds.—25 sq. rds. we harvested 1300 quarts of large excellent berries. This yield appears to us to be at the rate of 8320 qts. per acre. Fruiting season June 13 to July '39.

Variety, Fairfax and Premier. Plants set April '39 in rows 4 ft. apart. Plants average 2 ft. in row. Soil, rich sandy loam. Frequent cultivation kept the plot free of weeds. Fairfax plants were 1 ft. tall; Premier 8 inches. In Nov. '39 I covered the plants with straw, which was removed about May 1, '40. In Spring of '40 I dug out plants for 16-18 inches between rows, leaving solid rows, no breaks. I plan to keep over for fruiting in 1941.

—Wm. H. Doolittle, Phelps, N. Y.

SAVE DAYLIGHT—LOSE MONEY

"We are pleased to note your attitude in regard to Daylight Saving. It will cost the farmers of Western New York thousands of dollars this wet season. We had 15 days of rain in May and 15 days in June. It was impossible to work in hay only in the afternoon, and then to have to quit in the middle of the afternoon was disastrous to the farmers. It was put to a vote. The villagers, school teachers and high school pupils voted for Daylight Saving Time, the farmers voted against it. Hired help was for it, it gave them an hour or two more to run the roads with an auto and spend their money. It is hard to get workmen on the farm and a good many farmers are trying to get along without a man. The farm women are working in the cannery or bean house to get a new hat or dress. Where do we go from here?"—L.V.W., N. Y.

Editor's Note: Tell the local village fathers you won't stand for it.

FRESH Vegetables

ALL YEAR 'ROUND WITH A CONCRETE STORAGE CELLAR

A small concrete storage cellar lets you enjoy your own fresh fruits and vegetables all winter long. A larger one permits storing produce for the market until prices are highest.

Concrete cellars are permanent—simple and economical to build. They're damp-proof, easy to ventilate and to regulate for temperature. Our free 72-page manual, "Permanent Farm Construction," tells how to build them—and many other types of farm buildings and improvements. Send for your copy.

Field Days Are Here

for the VEGETABLE GROWERS

By PAUL WORK.

THAT Potato Field Day at the Gilbert Prole farm at Stafford, New York on August 8th is going to be something to get up before daylight and shout about! The theme song is "Better potatoes profitably produced". From 9 to 5, there will be plenty of things going on. In the forenoon, there will be contests for youngsters and grown-ups in grading and identification of varieties, tuber defects, and diseases with M. J. Merton in charge. All day, there will be demonstrations on varieties, breeding, fertilizers, insects and disease and so on. After lunch, Dean Ladd of Cornell will speak to be followed by Charles F. Letti, the Lieutenant Governor of the state. Then, there will be demonstrations of machinery for plowing, planting, harvesting and spraying. Commercial concerns will be there with their latest developments in equipment and supplies and there will be plenty of exhibits both educational and commercial including marketing, irrigation, and harvesting.

Paul Work

Anyone who travels a considerable distance to Stafford, which is near Batavia, had better plan to make a two-day job of it. On Wednesday, August 7th, there is to be a muckland potato tour on the Elba area assembling at the Cornell potato rotation experiment on the upland farm of Irving Green at Byron at 12:30 p. m. This rotation experiment which is being carried on in four different places in the state and is running for several years, will be explained. Three other farms on muck—those of L. R. Gillard, F. J. Ritz and Son, and Porter & Bonney are to be visited. At the Porter & Bonney farm, a potato combine which digs and delivers the potatoes in crates will be demonstrated. The highly developed system of getting potatoes ready for market as practiced on this farm will be in operation.

Dinner is to be at the Hotel Richmond at Batavia at 6:30 P. M. and then Professor W. I. Myers, Head of the Agricultural Economics at Cornell, will speak on "The Current Economic Situation."

Frost Nips Widespread but Not Serious

A month ago mention was made of frost rumors which filtered in from different parts of the state. Further checkup shows that the lowest temperature recorded was at Roxbury on the west side of the Catskills where the thermometer reached 28° and material damage was done to gardens. Bob Sweet, the new extension man in the Vegetable Crops Department at Cornell, reports that there was considerable burning of foliage among commercial gardens around Albany but that the plants have pretty generally outgrown the damage and the principal result was a bit of delay in maturity. Fairly cool sections such as Coopers-town, Delhi, Alfred and Andover reported frosts which did some damage to home gardens. There was also a touch of frost at Albion and on the Elba muck but the muck crops are hardy to frost so that loss did not

amount to anything. The New York Crop Report indicated that June frosts browned the leaves of snap beans and of cucumbers in some sections. The St. Lawrence Valley apparently was not hit but there were naturally fairly low temperatures at various points in the Adirondacks. This whole situation of wide-spread frosts in the latter half of June is a very rare occurrence in this section.

Field Day at Geneva

New York State Vegetable Growers' Association is to hold its summer meeting and field day at the New York Experiment Station at Geneva on August 14th. Visitors are to assemble at the experiment station at 10:00 Wednesday morning, and before dinner a general tour will be made of field experiments. A frozen food dinner at 60 cents is to be served on the grounds. Then, after dinner, there will be half-hourly demonstrations at a dozen different experimental lay-outs so that people will be free to spend their time with the things that are of principal interest to them. These include dusting and spraying melons; control of insects and diseases of other vegetables including cabbage, beans and tomatoes; freezing of vegetables on the farm and in factory; fertilizers; starter solutions; Vitamin B; and also tests of varieties and strains of vegetables. There is to be a trade exhibit of machinery illustrating latest developments.

Lettuce in Maine

Professor J. R. Hepler, vegetable gardener at the University of New Hampshire, reports that the Cape Elizabeth section of Maine near Portland has gone in heavily for lettuce during the past four or five years showing an increase of acreage from ten or fifteen acres to four hundred. The varieties are Imperial 847 and Imperial 44.

The lettuce is grown in rows 24 inches apart, thinned to 15 inches in the rows. Not much fertilizer is used. The earliest crop is started in the greenhouse and transplanted to the field. The lettuce is packed with ice and goes to Boston. Hepler says that the heads are the equal of Western lettuce in every respect and that the growers are getting as high as 75% good heads which represents a fine average.

This area also produces a considerable amount of cauliflower along with miscellaneous vegetables for nearby markets.

I had the privilege of visiting Cape

"Cut out the foolishness, Irma; this is no time to be blowing bubbles!"

Elizabeth a few years ago. The crops are grown on little areas of sandy soil among jutting rocks and patches where almost nothing would grow. It is a fascinating and thoroughly distinctive vegetable gardening section.

Vegetables for Winter Harvest

Dr. Hans Platenius of the Department of Vegetable Crops at Cornell is a chemist and a researcher but he is also a subsistence farmer. He has a lot of fun harvesting outdoor vegetables after freezing weather and even sometimes in late winter. His three principal plantings for this purpose are kale, spinach and broccoli. These are planted August 1st to 15th and ordinarily he has them at least until the 1st of February. By the use of straw mulch, he greatly improves his chances of their wintering over.

Early Birds

Ed Minnum, a graduate student here at Cornell, started some early muskmelon plants in veneer bands in the greenhouse. He fixed up a few bands in the same way with cucumber seed and he picked cucumbers before the end of June so there is another vegetable which can be had pretty early if we try.

My sweet corn is about ten days late—the first ears being ready July 24th. Tomatoes came on pretty early,—Earlianas by July 15th in the student gardens, and Grothen Globe in my own garden on July 20th.

Onion Festival in Orange County

Stella Gutowski of Pelletts Island has been chosen as queen of the Second Onion Harvest Festival in Orange County, New York. She was chosen from among five harvest princesses named by various communities in the muck soil area of the county. In addition to the winner, the other contestants were: Ceal Paskiewicz, Theresa Pawliczak, Frances Kata and Josephine Gustus.

Inasmuch as 90 per cent of the men growing onions in Orange County are of Polish extraction, it is quite fitting that the onion queen should be chosen from that group. In fact, one of the requirements of every contestant for the honor of harvest queen was that she should have worked in the onion fields as recently as last summer.

The two chief events of the Onion Harvest Festival on August 15 will be a tour through the onion growing districts and a pageant. The tour will occupy the forenoon, while the pageant, under the direction of Stanislaus Polenski, will be given at 3:30 in the natural amphitheatre on the Durland Farm halfway between Florida and Goshen. Mr. Polenski is the former director of the Opera Ballet at Cracow, Poland.

A Quick Move

On page 8 of our July 20 issue we reported the activities of a grape marketing cooperative in the Seneca Lake area. The heading on that article gave the wrong impression when it referred to Seneca County growers. It should have referred to growers in the Finger Lakes area. The cooperative is made up of members from the counties of Seneca, Schuyler and Yates. About fifty per cent of the members live in Schuyler County and about twenty-five per cent each in the counties of Seneca and Yates.

We hereby apologize for arbitrarily moving the growers from Yates and Schuyler counties over into Seneca County, and hereby serve notice that we have moved them back. Incidentally, if you didn't read the story, we suggest you look it up and do so.

HINTS for the Farm Mechanic

Simple Power Grinder

Nearly anyone could use another power grinder. Here is one that was made of pieces from the junk box—a pulley, a piece of $\frac{3}{8}$ " pipe, a $\frac{1}{2}$ " bolt

and two nuts. The grinder was mounted on a board which was clamped to the bench near the motor when needed.

Treating Galvanized Sheets

Please tell what chemical to use on galvanized steel sheets so that paint will stick. I have painted this metal without pretreating, and the paint always flakes off.—R. W. H.

Some authorities recommend washing new galvanized iron surfaces with a solution of 8 ounces of copper sulphate in one gallon of warm water and allow it to dry before painting. This will remove all grease or other substance that may interfere with the proper adhesion of the paint coat, and will not cause rusting under the paint.

The United States Lighthouse Service recommends before painting new galvanized iron surfaces to treat with a solution of one gallon of soft water mixed in an earthen or glass vessel with two ounces each of copper chloride, copper nitrate, and sal ammoniac, then with two ounces of commercial muriatic acid. Apply the solution to the galvanized iron when it will assume almost a black color, drying to a grayish film.

Most painters prefer to let the surface weather for six months, then when dry and warm paint without any further treatment.—I. W. D.

Watch Out for Spontaneous Combustion

Most farmers fear spontaneous combustion only with the storage of poorly cured hay, but the danger is present at all times where oil or paint covered cloths or waste are thrown in a corner, when a painter's oily drop cloth or overalls are rolled up and left in an

unventilated locker, and so on. You cannot be too careful about such materials.

* * *

Easy to Change Engine Washer to Electric

Farmers need not hesitate to buy a gas engine washing machine for fear they cannot readily change to electric when high line power becomes available. Most of the new washers are so designed that the engine can be removed and an electric motor installed

in about half an hour, in many cases at no additional cost.

* * *

Removing Caked Creosote

"Is there any preparation I can use to loosen creosote in a chimney which has caked so hard that I cannot get it loose by ordinary means?"

Burning a double handful of dry salt on a hot fire every few days will loosen and remove ordinary soot and creosote, and will gradually crumble it when caked. The zinc and manganese in old

dry cells also have a similar effect when burned on a hot fire. I do not know of any other materials which would be safe or practical to use.

It is also possible to clamp at the end of a 2 by 2 or light pole a wire brush or a board with sharp nails driven through it, with an arm to slide along the opposite side of the chimney and a spring adjustment to force the brush against the creosote. Frequent and thorough use of such a brush, in addition to burning salt, should remove even badly caked creosote.—I. W. D.

A Vagrant Automobile Cruise in the Deep South

(Continued from Page 1)

cerning the region and everything connected with it, and almost always your host and hostess will delight in telling you everything they know.

In addition to well appointed homes the South seems to be developing a very superior type of cabin accommodations. These collections of cabins style themselves "Courts" and the best of them offer splendid beds, heat, hot and cold water and private baths—all this for \$1.00 per person, two in a cabin. At "Cajun Court" on the Old Spanish Trail west of New Orleans we had accommodations so complete and perfectly appointed that even the most fastidious and sophisticated guest could hardly have entered a complaint. The service included a black man in a white coat who took possession of our baggage with all the assurance of a bell-hop in a swank city hotel. But one more important observation. Some cabins or homes may be all wrong—dirty and smelly and run down at the heel—and the wise traveler will on no account arrange to stay until there has been dispatched a scouting party to spy out the land and report. It is needless to add that on a delicate expedition of this kind a woman will see more and note more in two minutes than a mere man could possibly hope to see were he to stay a week.

There is a lot of Pennsylvania territory where traveling by automobile is not pleasant. One main route going south lies through the anthracite coal country—black and dismal and crowded with trucks, with one town running into another for many miles. This time with a little study we by-pathed most of the industrial regions and so found a leisurely rural route across the state. I am not an orchardist and I surely did not start out to find apple trees, but the route we took happened to include a good deal of the most highly specialized apple country in the east. Southern Pennsylvania and western Maryland have some very fine orchards, with the York Imperial as one of the leading varieties. The northern Shenandoah Valley, which includes one county of West Virginia, has a very intensive orchard region. Indeed Winchester, Virginia, tells you that they have the largest apple storage house in the world. In southwestern Virginia are some mountain coves that are full of orchards. Some of this land is very steep. It must be almost impossible to spray and surely difficult to dust and to harvest. I wonder if it is really wise to plant orchards on such mountain lands. In western North Carolina at twenty-five hundred feet above the sea were more apples, and there were even apples in the Georgia Highlands.

Now in one respect at least these apple orchards seem different from the familiar orchards of the Ontario Shore and the Hudson Valley. For one thing it is a relatively new development. One does not see the time-scarred, old veteran apple trees which one finds in Wayne or Orleans Counties for instance. It is my understanding that in the south the apple comes into bearing early and passes off the scene without attaining the years and girth and height of trees on the Ontario Shore.

None the less, these trees must be reckoned with for they are in the hands of enthusiastic newcomers. These orchards are pruned so that they can be kept close to the ground for spraying and harvesting, and frequently we heard the putt-putt-putt of spray rigs and caught the smell of lime-and-sulphur down the wind. I read that the number of bearing trees is actually decreasing but perhaps statistics do not take account of the fact that the apple trees of to-day, in the hands of far better men, are getting a very much better chance than in the old days

when it was the custom to set apple trees and then leave the results to Providence.

Neither of my daughters had seen either the Natural Bridge or storied Lexington. So we took the Shenandoah Valley Pike, which I suppose as no other stretch of highway in our country witnessed the marching and counter marching of Federal and Confederate troops during four long and bitter years. This fat country with its limestone soil and its wheat and corn fields was referred to as the "Granary of the Confederacy." In 1864 Sheridan came to the conclusion that the only proper fate for the valley was to turn it into a desert, which he proceeded to do as far as possible. He swept it so clean by fire that he boasted, "If a crow flies down the valley, he will have to take his provision with him." Among the burned buildings he numbered more than sixty grist-mills. In spite of this I photographed one old mill which both by the marker on it and by its appearance far antedated the War. It would seem that either it must have been missed in the general destruction or possibly its proprietor convinced the burning squad that he was a loyal supporter of the Union.

Well toward the head of the Valley is Lexington, most cherished Mecca of the Confederacy. Here is situated Washington and Lee University, and on an adjoining campus the Virginia Military Institute—always spoken of as the V. M. I. Often it is styled "The West Point of the South." I suppose it would be fair to say that it is the most famous of Military Schools. In the University Chapel crypt lies buried Robert E. Lee and many members of his family, while above—done in marble—is the reclining figure of the great Chieftain, representing him as sleeping in his uniform on a camp bed. It is a regulation of the V. M. I. that no cadet shall ever pass his tomb without pausing to salute. We of the North have nothing like that. Partly this is so because the North never had a military figure who captured the imagination as did "Marse Robert". Partly it is because a Lost Cause remains always dearer than one that is victorious.

* * *

From Harrisburg, Pennsylvania Route 11 makes a very direct southwesterly course to New Orleans. This would have been our most direct and easiest route but half way down Virginia we left it and made a swinging detour to the East. For one thing I wanted to take a look at Floyd County, Virginia, where I did Farmers' Institute twenty-seven years ago. This county, lying on the high plateau between the Blue Ridge and the Allegheny Mountains, is the one county in Virginia untouched by any railroad and as late as 1913 conditions there were unbelievably primitive. At that time we drove some sixty miles in the county, making the trek in a two-seat-

Meal time at the Three Winds Goat Dairy, Westbury, Long Island. This was the first certified goat dairy in New York State. On a certified milk farm, cleanliness is the number one requirement. There has been a rather rapid increase in interest in dairy goats in the Northeast.

ed wagon with a team of mules and a negro driver and my memory is that we did not cross a single bridge on the entire trip. All streams were forded—even big, strong creeks.

The more than a quarter of a century which has passed since I first visited Floyd County changed all this and today the county is crossed by good automobile highways and there are substantial iron bridges where an earlier generation forded.

* * *

Entering North Carolina we picked up a section of the Sky Line Drive and followed it for nearly seventy miles. This road is really an extension of the Sky Line Drive of the Blue Ridge in Virginia. I suppose that if present plans are carried through, we shall within a few years be able to drive from somewhere in Pennsylvania to northern Alabama and always be following the ridge-pole of some long mountain range. None of our party was able to enthuse concerning the Sky Line idea. For an hour such a drive is interesting and beautiful with far ranging views over tumbling peaks, with here and there views of little farms set in some mountain cove. Now and then there were rather breath-taking vistas where it would seem one might throw a stone to the floor of some little hollow a couple of thousand feet below the highway, but the road is perfectly new and raw and lonely and rather bleak. For us, an hour of it is enough. I much prefer to "people-see" rather than "sight see". For my part give me the valley trails where there are shabby old farms and little villages and gas pumps and grocery stores and, now and then, horses tied to hitching posts, and friendly natives sitting in the sun.

On the map the western end of North Carolina looks rather narrow but the distance proved greater than

we had expected. At any rate we spent the entire day exploring along the North Carolina-Tennessee border and at stopping-time were still in the "Old North State." I suppose that this day we threaded about the best mountain scenery in eastern America. I have never seen the Rockies but I am quite ready to believe that to one familiar with them, the Great Smokies may seem rather insignificant hills. None the less, these mountains are the best we have east of the Mississippi. Our whole Appalachian system, extending as it does from northern Pennsylvania to Alabama, culminates in the western North Carolina-eastern Tennessee region, which is a tumbled mass of peaks and a good many of which run well above the six thousand feet line.

For me the peculiar interest and charm of the Southern Appalachians lies in the fact that they are full of people. Here is the homeland of the Southern Mountain Whites or (a rather better term I think)—the Appalachian Highlanders. Somewhere in and along these ranges, which stretch for nearly a thousand miles, live some three million folks. From any outlook which reveals a stretch of this country, you may see their little frame or log houses and their log barns. You will find them on the bottom of every little cup-shaped mountain cove or by every little stream where there is a tiny stretch of arable land. Very often, also, you will see their habitations, clinging to incredibly steep mountain sides. They are poor and ignorant and proud, with their own code of honor and their own standards of conduct. It seems to be agreed that racially they represent the purest Elizabethan English stock remaining in the world because their isolation has prevented their contamination with any outside blood.

In slavery days they had no wealth or position and owned no slaves and so they instinctively hated the slave-holding aristocracy of the Piedmont and Tide-Water. By the same token in the War between the States they were passionately loyal to the North and to this day the old feud is still carried on because as a class, they solidly and unwaveringly vote the Republican ticket, and this in a region where for historical reasons every white man is expected to be a Democrat.

Some day if the kindly passing years will only grant me leisure and opportunity, I shall go back to these mountains again because the land has captured my imagination as nothing else I have ever seen in my travels.

Editor's Note:—In an early issue Mr. Van Wagener will tell you more about his trip.

"Good gosh; where th' dickens have YOU been?"

What Do You Think?

THE QUESTION for discussion this issue, as announced on page 10 of the July 20 issue, is "Is killing weeds the only benefit secured from cultivating crops?"

The weather this year makes this question more than usually interesting. In many fields it has been difficult or impossible to do enough cultivating to control weeds. Where weeds have been controlled, heavy rains have beaten down the ground and made it solid, and as soon as the rain stops, it cracks easily.

Here are a few comments from readers:

I believe that cultivation is just as necessary as fertilizer. If I had a crop without any weeds, I would cultivate just the same. When you get a dry spell, I think that there is more moisture available with a crop that is well cultivated than there is with one that isn't.—*Clifford White, Union Springs, New York.*

If I had a crop without weeds, I certainly wouldn't cultivate it. A few years ago conditions were just right so that my corn crop was practically weedless. I cultivated it just enough to control weeds, and I never had a better corn crop.—*William O'Hara, Port Byron, New York.*

In my opinion cultivation does more than kill weeds. I think most crops need to have the ground stirred early in the season, although I agree that it is unwise to cultivate deeply after the crop has established its root system.—*Mrs. F. L. Stillwell, King Ferry, New York.*

When a crop is clean of weeds, I give the cultivator a rest. So far as the moisture supply is concerned, control of weeds is more important than keeping the moisture. Weeds use a lot of moisture and plant food, and saving

that for the crop is the important point.—*Charles Dickinson, Ithaca, N.Y.*

The muck soil on which we grow vegetables crusts over very easily after a rain. We believe it should be stirred up even though there are no weeds.—*Lucian Martens, Port Byron, New York.*

Following are a few more comments on the subject of last week's discussion on whether the current European war has had any effect on weather conditions, especially in view of the heavier than normal rainfall:

Maybe it is punishment for our sins! One theory is that the unusual number of reverberations have upset the atmospheric balance. But I do not believe it. We have weather in definite cycles. Records for 100 years show wet and dry periods. These cycles may vary temporarily. For instance, in a period of more than average rain we may have drouth, and vice versa, but over a longer period the cycle theory is borne out.—*J. Franklin Bonner, Churchville, N. Y.*

Yes, sir, I believe the war is at least partly responsible. During the World War we had a heck of a time trying to get our hay in. We have had the same trouble this year. I believe the explosions and heat dry out the air, causing the atmosphere to draw up more water, and changing the normal air currents.—*T. W. Case, Spencerport, N. Y.*

Do You Believe in Water Witching?

The other day Mrs. Eastman, our cousin, and myself, stopped at a gasoline station in central New York and fell to visiting with an elderly gentleman, who showed us how water witching was done. He had a short willow stick with two prongs. Taking firm hold of these prongs, with the stick pointed outward, he walked slowly back and forth, until finally the stick turned downward in his hands, indicating, according to the theory, that there

was a stream of water underneath, and that if you should drill or dig there you would strike a well.

Each of us tried to make the stick work, but failed, but when we took hold with him, no matter how hard we held, the stick would turn in our hands and point downward when we came to a certain place.

This gentleman said that he had

"water witched" for a lifetime, and when a well had been dug or drilled where he indicated, water had always been found.

In spite of this actual evidence before my own eyes, I am still skeptical. What do you think? So far as space is available the comments you write will be published here in a coming issue. Let's hear from you.—*E. R. E.*

Where lime is added to a very acid meadow and plowed under, the second application can be put on the field after it is plowed.

A Good Way to Spread LIME

By E. VAN ALSTINE,

Agronomy Department, New York State College of Agriculture.

THE EASIEST way to get lime mixed with the soil is to spread it on meadow land after haying and before plowing for another crop. Corn, which usually follows hay, is not expected to be benefited very much, if any, by lime used in this way, but the lime is in the soil where it stays moist and where it has a chance to be absorbed by the soil. For best results lime must be mixed with the soil so it can be absorbed. It must destroy soil acidity before crops can get the benefit they need.

Lime on the surface of the soil may dry up and blow away, part of it may wash away or wash to the low parts of the field, and the rest of it would be absorbed less quickly on the surface than it is when plowed down.

Lime Both Sides of the Furrow

After harvesting the corn or other crop that follows hay, more lime may well be applied to be plowed down. This is necessary only on very acid soil or on land that is to be improved as quickly as possible. When the second application is plowed down, what remains of the first application is plowed up.

Lime that has been plowed down, left a year, then plowed up again and still further mixed with the soil in the process of seedbed preparation has a much better chance to sweeten sour soil than lime that is spread and harrowed in just before seeding. It is much more effective even than lime that is applied and harrowed in the fall before seeding.

Lime Plowed is Where Roots Can Find It

If a second application of lime is plowed down, clover roots will find more favorable conditions at the bottom of the furrow than can possibly exist when the lime is all at or near the surface. Lime in dry surface soil is inactive and of no immediate benefit.

If only one application of lime is to be made, it is still better to spread it on meadow land that is to be plowed. Lime that is plowed down is not in a layer at the bottom of the furrow. It is distributed throughout the furrow

slice even better if it is plowed in than it can be if it is harrowed in.

Advantages of Spreading Lime on Meadows

1. Meadow land is firm and easier to haul lime over than plowed land.
2. Meadows are smoother than plowed land.
3. It is easier to get lime in the summer than in the spring.
4. It is easier to find a convenient time between haying and fall plowing than during the rush of spring work to haul and spread lime.
5. Lime spread early on meadows does not interfere in any way with aftermath grazing or even with cutting a second hay crop.

5. It is easier to find a time between haying and fall plowing when weather conditions are more favorable to the handling of lime.

6. There is a longer period in the summer and fall to do the liming than there is in the spring and the work need not be rushed.

7. Summer liming distributes the cost of land treatment through a larger part of the year than liming in the spring when fertilizers and seed must also be bought.

"Hey boss, the milker you made is working in reverse!"

A. A. - GRANGE

Cookie Contest News

BROOME County Pomona Grange has turned out to be the early bird among Pomonas this year in holding its county-wide rolled sugar cookie contest. Ten out of 13 Subordinate Granges in the county were represented in the match, which took place July 13 and was won by Mrs. Maurice Mal-

Who says that Grange brothers can't make just as good rolled sugar cookies as Grange sisters! Leo Garrett, of South Trenton Grange, Oneida County, proved they could when he carried off first prize in the South Trenton contest. Two other Grange brothers will be found in this issue's batch of first prize winners.

lery of Susquehanna Valley Grange. The bulk of Pomona contests, however, will not be held until fall or late August, in order to give all Subordinates a chance to get their champions lined up.

Nichols Grange, of Tioga County, reports that they had a "Use More Milk" program in connection with their contest. Members had the fun of taking part in a milk quiz, and of helping themselves afterwards to some prize sugar cookies and tall glasses of milk.

The Harvey Dunn family of Camden Grange, Oneida county, carried off all the prizes in Camden's contest. Chairman Mrs. Donald Strail writes that Mrs. Dunn not only won first prize herself but is the mother of the second and third prize winners.

Chairman Elsie J. Lewis of Wadhams Grange, Essex County, which had 15 entries in its contest, writes: "Old and young members joined in this contest which kept the judges busy for the entire evening. This was the biggest of any of the Grange-American Agriculturist baking contests, and we have entered all of them."

List of Subordinate Grange first prize winners is still growing. Here are names recently added to the list:

A Busy Week at the State Fair

IF YOU are planning to exhibit farm products or stock at the New York State Fair, you should check on the closing dates for entries. There is no time to lose. In fact, it is already too late to make entries in the poultry show where entries closed August 1. Entries will be closed on August 5 for horses, cattle, sheep, swine, and goats. August 12 is the closing date for dairy products, butter and cheese. August 16 is the closing date for flowers, farm crops and fruit; and August 19 for home-made farm equipment.

On Tuesday, August 27, at the Fair 75 animals raised by 4-H Club boys and girls will be auctioned off at the Baby Beef Sale. Thirteen counties will be represented, and the auctioneer will be Fred Reppert of Decatur, Indiana. A year ago 60 animals sold for \$8,730.

Around 2,000 boys and girls are expected to be present or take part in the young folks' program at the Fair. The 4-H Club activities will be crammed into the first five days of the Fair, and the Future Farmers will put on their show the last four days.

One of the outstanding events for the Future Farmers of America will be the annual speaking contest. The winner will represent the state in the northeastern regional contest, and the winner there will take part in the national contest.

Tuesday is the date for the state spelling bee.

The Democratic National Platform

IN THE July 6 issue of *American Agriculturist* we printed the high spots of the Republican platform as adopted at the Republican Convention. At the same time we stated that following the Democratic Convention we would summarize in a similar way the platform adopted at the Convention. Here it is:

NATIONAL DEFENSE.—"The American people are determined that war . . . shall not come to America. We will not participate in foreign wars. We will not send our army and navy or air force to fight in foreign lands outside the Americas except in case of attack. We favor and shall rigorously enforce and defend the Monroe Doctrine."

"Weakness and unpreparedness invite aggression. We must be so strong that no possible combination of powers would dare to attack us."

"We denounce and will do all in our power to destroy the treasurable activities of disguised anti-democratic and un-American agencies which would sap our strength. . . ."

AGRICULTURE.—In substance the Democratic plank on agriculture promises to continue the farm program along present lines. The party pledges itself to make parity as well as soil conservation payments until a parity income for agriculture is realized; to extend and enlarge the tenant purchase program; to preserve and strengthen the ever-normal granary; to continue commodity loans; to expand domestic consumption by the food and cotton stamp plan, low cost milk, and other plans; to continue appropriation for research and extension; to encourage marketing agreements; to extend crop insurance; and to provide for adjustment of production.

The platform also promises to cultivate foreign trade through desirable trade agreements.

LABOR.—"We pledge to continue to enforce fair labor standards; to maintain the principles of the National Labor Relations Act . . . ; to strengthen the orderly processes of collective bargaining and peaceful settlement of labor disputes."

BUSINESS.—"We have defended and will continue to defend all legitimate business. We have attacked and shall

Announcing a "Pin Money" Contest for Our Readers

MANY WOMEN make extra money at home, and we want to know how some of our readers are doing it, so that we can pass on good ideas to others.

Maybe you are a champion cook and win county and state fair prizes with your canned goods or baked goods. Or your needle may win prizes for you, or bring in money from the sale of special articles that you can make. Perhaps you run a successful tourist home, or have a flair for making delicious and saleable homemade candies, or make extra money in any number of other interesting and profitable ways. We know one woman who has been able to support herself through her talent for designing and making attractive greeting cards. Another woman, a shut-in, amused herself making dolls from nuts and is now selling them. So what's your way of making extra money? *American Agriculturist* will pay \$5 for the best letter on this subject, and \$1.00 each for as many more as we can print. Address Pin Money Contest Editor, *American Agriculturist*, Box 367, Ithaca, N. Y. Contest closes August 17.

continue to attack unbridled concentration of economic power and exploitation of the consumer and the investor."

"We shall continue to oppose barriers which impede trade between several states."

"We have enforced the anti-trust laws more rigorously than at any time in our history."

SOCIAL SECURITY.—"We pledge to make the Social Security Act increasingly effective by covering millions of persons not now protected under its terms, by strengthening our unemployment insurance system, by progressively extending and increasing the benefits of the old age and survivors' insurance system, and by the early realization of a minimum pension for all who have reached the age of retirement and are not gainfully employed."

CONSUMERS.—"We are taking effective steps to insure that in this period of stress the cost of living shall not be increased by speculation and unjustified price rises."

VETERANS.—"We pledge to continue our policy of fair treatment of America's war veterans and their dependents in just tribute to their sacrifices and their devotion to the cause of liberty."

CIVIL SERVICE.—"We pledge the immediate extension of a genuine system of merit to all positions in the executive branch of the federal government except actual bona fide policy-making positions. Promotion and tenure in federal service shall likewise depend upon fitness, experience and qualification."

RELIEF.—"We are opposed to vesting in the states and local authorities the control of federally financed work relief. We will continue to direct our efforts toward the employment in private industry of all of those willing to work."

"We favor calling, under the direction of the President, a national unemployment conference of leaders of government, industry, labor and farm groups."

HOUSING.—The platform pledges to extend and increase loans and contributions to rid America of overcrowded slum areas.

Shall It Be Glass Bottles or Paper Containers?

By LELAND SPENCER

LAST NOVEMBER the leading retail distributors in New York began putting up milk in 2-quart paper containers for family trade. Their object was to cut down the cost of retail distribution so that they would be able to compete more successfully with wholesale distributors and stores.

Leland Spencer

As readers of this column already know, thousands of families in New York City have taken to getting their milk from stores in the past few years. Volume on the retail routes has dwindled and costs of retail delivery have gone up rapidly. The main reason for the shift from routes to stores is the difference of 2

ing, or storing of bottles and no bottle exchange expense. For several reasons delivery costs are much less on the milk put up in 2-quart paper containers. In the first place, a dozen quarts of milk in square-style paper containers weighs less than half as much and takes up much less space than the milk put up in glass bottles. Furthermore, the milk in paper containers ordinarily requires little or no refrigeration in the course of distribution. More important still is the fact that the majority of families who take their milk in 2-quart containers have it delivered on alternate days rather than every day. Thus the driver can deliver more quarts of milk per day.

It should be noted here that most of the customers who have adopted the 2-quart container use a quart or more of milk per day, while the majority of those who have stuck to the glass bottle are the smaller customers. Part of the difference in delivery costs shown in table 1 is due to the difference in size of customers served.

Grade B milk in 2-quart containers is now priced to the consumer at 1½ cents less per quart than milk delivered in quart bottles. If the customer takes as many as seven 2-quart containers per week, she gets a price of 12½ cents per quart. At the 13-cent price the distributor apparently is making a smaller profit on the milk sold in paper containers than he is on that sold in quart bottles. However, we must remember that the 2-quart container business is still in the process of development. Further changes are to be expected.

The use of the 2-quart paper container on retail routes may result in substantially larger savings in delivery costs providing it is found to be possible to reduce the number of route trips per week from seven to six, or possibly to three or four. The 2-quart container has largely solved the problem of milk storage in the family refrigerator, and there seems to be no good reason why every family that has a refrigerator could not get along on three or four deliveries per week. If this change can be brought about, it will be possible to reduce the delivery cost and the retail price per quart by at least another cent, or possibly 1½ cents per quart.

June Milk Prices

Administrator Cladakis has announced that the uniform price to producers shipping to New York City is \$1.56 for June milk. This price is for 3.5 milk in the 201-210 mile zone, and is 2c below the May price of \$1.58. The price which any producer gets will be the base price plus or minus differentials for freight and butterfat tests.

In the Rochester Market, the June uniform price has been announced as \$1.61. Producers who make direct delivery will get an additional 18c.

The uniform price for the Buffalo market was \$1.49 for June. However, a very large percentage of the milk in the Buffalo market is delivered directly by producers to plants in the marketing area. On this milk producers are paid a direct delivery differential of 20c a hundred. As much as 2c is deducted from payments to producers to pay the expenses of administering the pool. The net return to at least 90 per cent of the producers in the Buffalo area was \$1.67 per hundred for 3.5 milk.

Delegates to the Metropolitan Co-operative Milk Producers Bargaining Agency met at Syracuse on July 15. The delegates adopted a resolution ask-

TABLE 1. APPROXIMATE MAKE-UP OF RETAIL PRICES OF GRADE B MILK IN NEW YORK CITY, JULY 1940.

Item	Milk in 1-quart glass bottles	Milk in 2-quart paper containers
Price paid by dealer.....	5.6	5.6
Operating expenses:		
Country plant expense.....	0.4	0.4
Transportation expense.....	0.7	0.7
City plant expense.....	0.8	0.5
Container expense.....	0.25	0.9
Selling, delivery and collection expense.....	6.25	4.5
General and administrative expense.....	0.25	0.25
Total operating expense.....	14.25	12.85
Profit.....	0.25	0.15
Retail price.....	14.50	13.00

The cost of the milk to the dealer and the dealer's expense for country plant operation, transportation, and general administration is the same whether the glass bottle or the paper container is used. City plant expense is lower on milk put up in paper containers since there is no washing, sort-

THE ACCIDENTS WHICH THIS POLICY COVERS ARE:

1. By the wrecking or disablement of a pleasure type automobile, automobile truck, horse drawn wagon, cart, sleigh, or sled, in which the insured is riding or driving.
2. By the wrecking or disablement of a public conveyance provided by common carrier for passenger service only (aeroplanes excluded) within which the Insured is riding as a fare-paying passenger in the place regularly provided for passenger service.
3. By being struck, knocked down, or run over while walking or standing on a public street, public sidewalk or public highway by a moving vehicle.

CASH BENEFITS AS FOLLOWS:

1. \$1,000.00 for loss of Life, or the loss of the sight of both Eyes; or the loss of any two members, such as a Hand or Foot.
2. \$500.00 for loss of sight of Eye, or Hand, or Foot—Loss of Life or Member must occur within 30 days from date of accident, otherwise weekly benefits are paid.
3. \$10.00 a week for as many as thirteen weeks while totally disabled unable to do any work whatsoever—benefits beginning immediately following the accident. No benefits are payable for partial disability.

This protection applies on accidents happening anywhere within the United States or Canada. Death benefits are payable to insured's estate, all other benefits payable to insured.

These benefits are paid where the insured is between the ages of 15-59 years. One-half benefits are paid ages 10-15 and ages 60-74.

WHO CAN HAVE THIS POLICY

This policy is available to anyone who is not crippled or who has not lost the sight of either eye or limb—the policy does not provide indemnity if the insured is under the influence of intoxicants, nor does it cover a watchman, law enforcement officer, volunteer or paid fireman, or railroad employee *while on duty*.

OUR GUARANTEE

Each policy is sold with a money back guarantee. After you receive your policy you have 5 days to look it over and if it is not satisfactory, return it and it will be cancelled and your money refunded at once.

Mail your application to:

North American Accident Insurance Co.

N. A. Associates Department

10 North Cherry Street, Poughkeepsie, New York.

I do hereby apply for a North American Accident Insurance Policy, Series 416, which costs \$2.00 a year, and understand that I can carry this new policy in the place of the \$1.00 or \$1.25 policy, but not in addition to it.

APPLE GROWERS Study Advertising and Sales

By L. B. SKEFFINGTON.

FEW SUBJECTS have been discussed more generally and with less definite conclusions at fruit growers' meetings than the matter of advertising, promotion and merchandising. The Joint Fruit Committee of the New York State Horticultural Society and the State Farm Bureau Federation named a sub-committee to wrestle with the problem. Frank W. Beneway of Ontario, N. Y., is chairman of the 11-man committee.

As a step toward learning the private views of all committee members they were asked to fill in a lengthy questionnaire. One member studied it and remarked that "it required a lot of thought." To which Beneway said: "That is exactly what we want—a lot of thought, not snap judgment."

The committee has reached no conclusions; in fact, it is just beginning to get a viewpoint on the subject. Two members of the committee did not bother to return the questionnaire, and two others "ducked" on one or two points, but on the whole there were clean-cut opinions expressed.

There was unanimous agreement that some form of grower-sponsored promotion and merchandising is required, unless growers are willing to sit back and take their licking. There was unanimous dissatisfaction with present demand and prices for fruits, with the belief that this situation could be improved. There was unanimous belief that it will be wise at the proper time to co-ordinate promotional and merchandising work on cherries, peaches and apples.

The thought was expressed that, in general, the three fruits are produced by the same growers, and reach the same consumers through the same retail trade channels.

The committee divided on whether surplus purchases by the government could be used to solve the problem. Generally, it was agreed that such purchases are helpful when growers are distressed, but that they also have the limiting factor of setting a ceiling on the market. There was little sentiment for curtailment of production to improve the market, but rather belief that production should be maintained or expanded to supply widening markets and meet competition. Varieties that are uneconomic should be eliminated, a number of committeemen said.

The wide-open disagreements in replies by members were on how promotion work should be financed and how much growers should be asked to pay. Several methods of providing funds were suggested to the committee. The next step by the committee will be to summarize opinions expressed by its members and send the summary, along with the questionnaire, to a wide circle of growers to determine what, if anything, growers generally are willing to support. Before the committee compiles a tentative report it will hold a public hearing. It is hoped to have a tentative report ready for discussion at the forthcoming winter meetings.

Cherry Prices Up

History has been made in the sour cherry industry this summer. In the first place, the public no longer will get sour cherries because it reacts against the name. Generally they will be referred to as tart varieties of cherries, red-pitted pie cherries or just pie cherries. Under auspices of the New York State Cherry Growers' Association a four-state meeting of producers, processors and marketers was held at Buffalo recently. Horace M. Putnam of Lyons, president, presided. A

national stabilization committee was set up with Carl Wooster of Union Hill as acting chairman.

One of the points brought out was that although last year's crop was about twice the normal it was moved into consumption through effective sales promotion work. Growers in New York last year received one and one-half cents per pound; but this year the crop has been sold for three cents. The Buffalo meeting adopted a resolution requesting the federal government not to include tonnage estimates in its June crop forecast because the figures have to be compiled while trees still are in bloom. There seems to be widespread opinion that the crop estimates have overshot the mark, not taking into account cold and wet weather, leaf-spot and other factors.

The Buffalo meeting adopted a resolution stating that it could not countenance a price of less than three cents to growers. This brought strong objections from some growers that the price was too low. Later directors of the state growers' association stuck to the resolution, explaining that it was their opinion that growers wanted a fair price at which the crop could be moved so that there would be no large carry-over from year to year.

* * *

To "Gas" Store Apples

A room is being prepared at the Sodus cold storage plant for "gas" or modified atmosphere storage of apples this fall. This will put into practical commercial operation a development which has been studied at Cornell for a number of years. The Sodus room will have a capacity of 7,000 bushels and will be perhaps the first commercial venture of its kind in these parts.

James G. Case, president of the storage company, said he did not think there would be much if any extra charge for use of the room. He said the company was trying it as a service to the industry. Growers will be required to leave their fruit in storage until certain specified times, because after the apples are "gassed" into a sort of twilight sleep the atmosphere must be maintained until the fruit is "awakened" for movement into sale. Experience at Cornell has been that the tender varieties of apples may be kept for a year in practically the same state of perfection in which they went into storage.

FARMER, on 140 acre farm, good location, good road, modern conveniences, would like someone with either cash or credit to invest in cattle or cash-earning livestock, to join him. Farm can carry 40 head of cattle. If interested write A. N. M., c/o American Agriculturist, Savings Bank Building, Ithaca, New York.

"—So, Gentlemen, we must lease the floor below at once."

THE LEAGUE STANDS FOR THE AMERICAN WAY

...and so he fought to **FREE AMERICA!**

"AMERICA is the Greatest Country in the World" ... says STEPHEN FUSEK

"You can say what you want; and do what you want in America," says Stephen Fusek. He lives on a hill farm in southern Oneida County. There are five sons and three daughters in the family. One of these, Ann Fusek, is a graduate of Cornell University, winner of the Home Economics speaking contest during the 1940 Farm and Home Week. Her talk so ably pictures her own family's successful search for "life, liberty and the pursuit of happiness," that we print part of it below:

Said Ann Fusek:

"I can vividly remember the day more than 16 years ago when we moved to the farm where we now live. It was in the dead of winter and the half mile dirt road leading to our new home on Tassell Hill was snowed under. My parents arrived in typical immigrant fashion, with all our belongings piled in two big hay wagons.

"I loved the whole big adventure. I remember it all, but the most vivid recollection was formed during our hot but meagre supper, when my father, his broken English booming through the house, said, 'Yes siree, Mrs. Fusek, (he always calls my mother that) at last we have our own home and I am my own boss and on my own land.'

"I didn't at the time understand the deep significance of his words but the warm, intimate expression, 'on my own land,' radiated to us all and enveloped us with happiness."

Mrs. Fusek and one of her daughters.

Dashing, gallant Captain Thaddeus Kosciuszko belonged to the proud officer class of old Poland, shortly before the American Revolution. He loved the fine promise in Thomas Jefferson's words—"life, liberty and the pursuit of happiness." But his associates hated those words. And the father of the girl he was about to marry almost killed Kosciuszko because he believed in them. So Kosciuszko came to America, offering General Washington his sword and the soldierly skill he had learned in the artillery schools of Europe.

Washington elevated him to the post of Adjutant to the Commander-in-Chief. Congress made him a Brigadier-General. He died in Poland — still hated by the special interests whose profits and privileges he threatened, but still fighting for "life, liberty and the pursuit of happiness."

Ever since America's "Declaration of Independence," American farmers have fought for "life, liberty and the pursuit of happiness." Once they used muskets to hurl back armies of hired Hessians. Today they fight with words, organization and economic forces. But even today many of their opponents are mercenaries fighting under a borrowed banner for private profit.

And these mercenaries—the anti-farm gang of lawyers, publishers, politicians and middle men—are the ones who have caused the greatest havoc in the ranks of farmers. Farmers used to listen to them . . . used to believe the things they said . . . because farmers didn't realize that these men were in the pay of dealers, or were seeking selfish ends at the expense of the farm. Farmers were too honest to understand the dark treachery of the "divide and rule" policy of a few dealers. They couldn't believe that anyone would stoop so low as to try to poison one farmer's mind against another farmer simply for profit.

But that was the sober truth—and only by co-operative action, only by farmers sticking together against the efforts of all outsiders, was it finally possible for farmers to win their battle. Then through the co-operatives and the bargaining agencies came a spirit of neighborliness throughout the length and breadth of the milkshed. Finally came the hard-won victory—A LIVING PRICE FOR MILK. Farmers at last were able to enjoy some measure of the "life, liberty and pursuit of happiness" that had been promised them.

Members of the Dairymen's League are proud that they were the first to weld together a lasting organization of farmers . . . and that from the first this farmer-owned-and-controlled organization has fought wholeheartedly for the rights and liberties of all farmers. Members are proud, too, that this organization still is on the alert . . . still is ready to fight some more. For long experience has taught them that the anti-farm gang is never beaten . . . that it is most dangerous when it appears to have given up. That's why the Dairymen's League warns every farmer today—unite and watch. Be ready for anything and everything. Because there's never an armistice, never a lasting peace in the eternal struggle for "life, liberty and the pursuit of happiness."

THE THOUSANDS OF FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE

Northeast Markets for Northeast Producers

DAIRY CATTLE

"Invincible"

Sons of Carnation Inka Invincible, our son of Sir Inka May, who now joins ranks of 1000 lb. fat sires.
Orchard Hill Stock Farm, M. R. Klock, Fort Plain, N. Y.

Holsteins—T.B. Accredited; 250 Head.
Offering surplus breeding stock of all ages; a few bulls of serviceable age backed by several generations of good C.T.A. records. Inspection invited.
E. P. SMITH, SHERBURNE, N. Y.

FANYAN FARMS

C. C. BENNETT, HOMER, N. Y.
Offering: One service age, two baby sons of "Cornell Royal Blond," famous son of All American 1152 lb. fat cow, "Cornell Ollie Catherine"; his second dam All American 4.3%, 1079 lb. fat sister of his dam, Cornell Ollie Pride.
Dams of these bull calves are daughters of our former 911 lb. 4% Snow bull, sired by Aristocrat, famous son of the World's Champion 4.3% "Snow Countess". Dams all have fine official records in Class C twice a day milking. They will please you as to type. Records and per cent test of dams available.

Ready for Service — Young Bulls
from our outstanding Champion Show Bulls. They are bred for type as well as production. Prices reasonable.
J. REYNOLDS WAIT, The Wait Farms, Auburn, New York.

TARBELL FARMS Accredited Negative
Guernseys 350 HEAD
YOUNG BULLS OUT OF HIGH RECORD A.R. DAMS AND SIBS BY
MAY ROYAL'S HOLLISTON 130308
98 A.R. Daughters.
FOREMOST PEACEMAKER 214202
15 A.R. Daughters
ALSO A FEW A.R. COWS AND HEIFERS.
Tarbell Farms, Smithville Flats, N. Y.

YEARLING GUERNSEY BULLS

Grandsons of Royal Supreme 137088 from dams with herd improvement records. Herd average 9602 M., 486.0 F. Prices reasonable considering quality. Accredited — Negative.
WYCHMERE FARMS, ONTARIO, N. Y.

COWS FOR SALE

T.B. Tested Holstein and Guernseys in Carload Lots. Ninety Day Retest Guaranteed.
E. C. TALBOT, Leonardsville, N. Y.

Altamont Jersey Farms

ALTAMONT, ALBANY CO., N. Y.
Established by Mr. Perley A. Dutton, importer and constructive Jersey breeder for more than 25 years. Imported and high grade Commercial cattle, T.B. and Bangs tested at prices commensurate with quality. Visitors always welcome at
ALTAMONT JERSEY FARMS,
15 miles from Albany, 10 miles from Schenectady on Route 146. Phone 2301.

PUREBRED AND GRADE JERSEYS

WITH ANY REQUIRED TEST.
PARTIAL CREDIT GIVEN.
J. K. Keith, Phone 722F3, Oneonta, N.Y.

WANTED TO BUY —

10 OR 15 PUREBRED HOLSTEIN HEIFERS DUE SEPTEMBER OR OCTOBER.
D.H.I.A. RECORDS MUST BE AVAILABLE.
Box 322, Chester, New York

One Carload of heifers 1 to 2 years old
and one carload of cows due this fall, winter and spring with H.I.R. records, imported bred, approved herd eligible for shipment to any state.
Also Belgian horses.
JOHN C. REAGAN, Owner, Spot Farms, TULLY, N. Y.

ABERDEEN-ANGUS

ABERDEEN-ANGUS

REGISTERED
40 YOUNG COWS AND HEIFERS FOR SALE.
SEVERAL YOUNG BULLS. COME AND SEE THEM.
W. A. Hawley & Son, Warsaw, N. Y. Wyoming Co.

Registered Aberdeen Angus Bull,
13 MONTHS OLD, A THICK, DEEP YOUNG BULL, with a good pedigree, T.B. and Bangs Tested, priced reasonably. Two miles south on Route 2.
J. A. Dickerman, R.D. 4, Ithaca, N. Y.

5 Young Cows freshen in fall;
3 YR. OLD BULL. YEARLING BULL. 3 HEIFERS OPEN.
ALL VERY NICE. ANGUS? OF COURSE!
R. C. LEWIS, R.F.D. No. 3, GLOVERSVILLE, N. Y.

MISC. LIVESTOCK

Choice Dairy Cattle - Fancy Horses
CARLOAD LOTS OR RETAIL. PRICED TO SELL. FREE DELIVERY ANY PLACE.
E. L. FOOTE & SON, Inc., Hobart, N.Y. Established 1845

FOR SALE —
CHOICE O.I.C. SWINE, BRED SOWS, SHOATS, PIGS. ALSO FEEDING SHOATS AND PIGS.
YEARLING SERVICE BULLS, HOLSTEINS, GUERNSEYS AND AYSHIRE.
Sayre Dairy Cattle Co., Sayre, Pa.

A ROAD That Goes Two Ways

This page in American Agriculturist carries messages two ways, two directions.

THE FIRST WAY

It brings to you a big field, not of hay or grain, or corn, or beans, or cabbage or what have you, — but a big field of **FOLKS**, — Folks who are in the market to buy a cow or a horse, or pigs, or sheep, or chickens, or something **YOU** may have to sell.

THE SECOND WAY

It is a direct road. This message carrier travels to over 190,000 readers with your message. It goes to a select group, — people who are in the same business you are in, use the same equipment, and may want to buy whatever you have for sale. Advertise in this page and know you are reaching a select group, what is called in advertising lingo "Complete Coverage". For details about it write

AMERICAN AGRICULTURIST, Advertising Dept., Savings Bank Bldg., Ithaca, N. Y.

HORSES

FOR SALE (or exchange for milk cows, bred heifers, hens or pullets)
SADDLE HORSES, DRAFT MARES AND COLTS.
L. A. FISHER, SPENCER, N. Y.

P-O-N-I-E-S

ALL SIZES OF CHILDREN'S PONIES.
REASONABLY PRICED — FULLY GUARANTEED.
Torrey Pony Farm, Clinton Corners, New York.

SWINE

Pedigreed Chester Whites
SOWS, BOARS AND PIGS, ALL AGES.
WORLD'S BEST BLOOD. MUST PLEASE.
C. E. CASSEL & Son, Hershey, Penna.

PIGS: Pure Bred O. I. C.,

5 weeks old. Either sex.
Malcolm Fuller, R.F.D. 6, Fulton, N. Y.

SPECIAL OFFERING, 50 PIGS

while they last. Eight to nine weeks old, \$3.50 each. Shipped C.O.D. your approval.
The Cass Dairy Farm, Inc., Athol, Massachusetts.

REGISTERED LARGE English Berkshire Spring Pigs.
SIBS BY SON OF CHAMPION OF CANADA 1938.
PRICES VERY REASONABLE. WRITE
M. H. VANDERHOOF, Hanover, N. J.

Frank R. Keenan, Groton, Vermont.

DOGS

DOGS

Price list of all popular breeds for a stamp, or dime brings you a nice 34 page dog book with price list enclosed.
We handle watch dogs, farm dogs, pets, companions and hunting dogs. Satisfied customers in nearly every state. Write your wants to
Blue Ribbon Kennels, Madrid, N. Y.

FARM MACHINERY

WANTED: Used Portable Hay Press.
GIVE FULL DESCRIPTION AND PRICE.

DOWN THE Alley

By J. F. (DOC.) ROBERTS

LIVESTOCK never sells at its exact value. From the very nature of our profit system, it is a speculation for producer, packer, retailer and even consumer. Nevertheless, there are some things that you can do in marketing livestock that will reduce this speculation. Since there is no such thing as exact value for any animal or group of animals, there should never be anything marketed from your farm until, or unless, it at least looks attractive. A thin horse will never bring its value. Fat, sleek ones often bring more than they are worth.

Thin, worn-out, old cows will always improve enough in just a few weeks, with good feed and good care, to pay the cost of this care and attention before marketing. The other day I saw a man sell a good, little 110 lb. calf for \$9, or a total of \$9.90; then he bought a little, light calf weighing 70 lbs. at 7c a lb. In other words, he exchanged for a difference of \$5. When I asked him about this, he said he would make the 7c calf weigh 110 lbs. and market it; but when I asked him why he didn't make this calf weigh 200 lbs. (which would bring \$11, or a total of \$22, and a difference to him of \$17), he simply said he hadn't figured it out that way. A good many times I wonder if there is enough "figuring out" when it comes to marketing.

Hogs:—A good many men in the industry feel that animal fats, such as lard, will never again hold their former position with the public. Fats from the ground, refined oils, soy beans, nut

oils, etc., will continue to meet at least a part of the demand for fats. Therefore, hog raisers should make their plans so that they will never again market hogs weighing much over 200 lbs., and breed hogs for meat, not fat. This is almost sure to continue to be good hog-marketing advice.

Lambs:—Should never be marketed from any farm, weighing less than 75 lbs. Experiments have shown there is no such thing as a little 30 or 40 lb. "skip" lamb; that wherever they do exist, they are man-made, not nature-made. Many times, our State Colleges have taken these little "skips", even in mixed lots, out of stockyards, and in no case have they failed (with proper drenching, and other parasite control methods, and good feed and care) to change them into at least 75 lb., edible, usable, meat.

Market breaks run in more or less definite channels, because livestock is always either too high or too cheap. When it gets too high, it breaks, and that break is always carried too far; and then when it gets too cheap, it goes up. Therefore, never market following a long or sustained break. In fact, if you market on a break, you are only making that break worse. On a rising market, don't figure you can hold and hit the top; few ever do. When your stock is ready, and it is bringing a good price, market it. Don't wait until the first break and then rush to market. Usually, you will be too late.

The importance of knowing market prices cannot be over-stressed. You can keep posted by means of your daily newspaper, government market reports, which are usually made from actual transactions, and you can get market trends from the *American Agriculturist*. The reason I say this is that combinations in localities so influence prices that they get way out of line with values in other localities. Be posted yourself; be suspicious of local "prevailing prices", or the price your neighbor received.

New York Hereford Breeders Form State Club

IF YOU ARE one of those who think that raising beef cattle in the Northeast is a fad rather than a business proposition, you should have heard the farmers who talked at the banquet of the beef cattle breeders at Farm and Home Week at Cornell last winter. The 250 farmers attending the banquet heard Commissioner Noyes discuss the need for diversified farming and the place of beef cattle in such a program. Then they listened to some of the experiences of the following breeders: Walter Fisk of Wolcott, William Hamilton of Jamesville, Samuel Morrison of Pine Plains, Clayton Taylor of Lawtons, Thomas Schoon of Geneva, and David Beresford of Delanson.

These men presented a strong case for beef cattle in the East. Among the favorable conditions are: we are right at the door of city markets, beef cattle require little attention, pastures

are good, and beef cattle can be wintered loose in inexpensive sheds or barns.

It was pointed out that where a man has a small herd of beef cattle, he should have another source of income, preferably one that provides the most work in the summer such, for example, as cash crops or fruit. While much of the early gains with beef cattle can be made on suitable pasture, heavy grain feeding is required when it comes time to fatten them.

Professor Johnstone-Wallace told those attending the meeting that the best pastures must be developed over several years by dividing pastures to allow rotation grazing, by clipping pastures when the grass gets over 4" high, and by adding 600 lbs. of superphosphate per acre once every six years and applying lime where it is needed. It also helps to spread droppings in the fall by harrowing and to roll the pastures in the spring.

During the week a group of interested Hereford breeders organized the New York Hereford Breeders' Association. Officers elected were: David Beresford of Delanson, President; and Harold Willman of Ithaca, Secretary-Treasurer. As a start it was decided that breeders would work together to give Hereford cattle some publicity, and that an attempt would be made to secure a complete list of Hereford breeders in New York State. Already the list contains the names of 120 Hereford breeders located in 34 counties and owning 2500 head of Herefords. Wayne County has 15 herds; Rensselaer County, 13; Steuben County, 11; Tompkins, 7; Chautauqua, Livingston, Onondaga, Seneca and Washington, all with 5; while the remaining 14 counties have less than 5 herds each.

SAFE AND EASY!

New CRAINELATCH on 24-SQUARE Door System

One of the greatest improvements ever furnished on silos. New Crainelatch Step draws big, 2-foot-square doors extra tight all around. Yet it lifts up easy as a pump handle. Provides 25% more hoops. Big, wide door openings. Never a tight squeeze even when you're bundled up in winter clothes. Now furnished on famous World's Fair Craine Korok, and available on Craine Triple-Wall and Craine Wood Stave Silos. . . . Write for folder and **Early Order Discounts.**

FARM WEEK AT WORLD'S FAIR

Officials of the World's Fair, of the Fair's leading exhibits, and of farm organizations are putting their heads together to make Farm Week, which begins August 12, the outstanding event of its kind in the Fair's history. Hundreds of thousands of farmers, with their families, are expected in New York for the festivities. Dozens of major exhibitors will hold "open house" celebrations in honor of their farmer guests, and special cut rate transportation, admission and lodging charges are to be announced. Among hundreds of special events will be contests, theatrical performances, fireworks, dances, concerts and hilarious outdoor shows. Hard at work on these elaborate plans are, (left to right), R. R. Ryan, assistant director of the Ford Motor Pavilion; Charles Brandt, Fair's Special Activities Department; Clayton Irwin, director of the Electric Utilities exhibit; J. N. Embree, manager of the Borden Company's exhibit; Grange Lecturer J. C. Farmer of Keene, N. H.; Cliff Smith, director of the Firestone exhibit and chairman of the exhibitors' Farm Week Committee; Fred L. Black, director of the Ford exhibit.

THE BEACON MILLING COMPANY, Cayuga, New York, recently published a fourth edition of "Profitable Turkey Management." This booklet is written by S. W. Hamilton, formerly of the New Jersey Extension Service and now poultry specialist with the Beacon Milling Company. This company has conducted extensive experiments with turkeys for some years, and the booklet, which is free to any reader on request, is full of practical information.

HEN HEALTH

"First Aid to Poultry" is the title of a booklet published by DR. SALISBURY'S LABORATORIES of Charles City, Iowa. Its many pictures will help you to recognize common poultry diseases, and in it there are many suggestions for maintaining a healthy flock. If you would like to have this book, just drop a post card to Dr. Salisbury's Laboratories, telling them you saw the book mentioned in *American Agriculturist*.

DRINK MORE MILK!

Commissioner Noyes of the New York State Department of Agriculture and Markets has announced the start of the Sixth Annual New York State Milk Publicity Campaign. Aimed at increasing milk consumption both in cities and in the country, the milk campaign will stress the importance of milk in health. It has been sanctioned by the State Department

of Health. The cost of advertising is borne jointly by milk producers and distributors. The first campaign was started in 1934 following a steady decline in milk consumption. Latest figures show that over 18,000,000 more quarts of milk a month were used in New York City in 1939 than in 1935.

JUST PLUG IT IN.

FAIRBANKS, MORSE & COMPANY, 600 S. Michigan Ave., Chicago, Illinois, have announced a new home water system. The system is complete to the point that it is only necessary to plug it into an electric outlet and it is ready to go to work. The pump has but one moving part, has a pressure tank of 7.3 gallon capacity, a 1/6 horsepower motor, and can pump 250 gallons of water an hour with a 15 ft. suction lift. It is designed for wells which are 22 ft. or less in depth.

REWARD FOR RESEARCH

Borden awards for outstanding research in dairy science were recently given to Dr. C. W. Turner, professor of dairy husbandry at the University of Missouri, and Dr. B. W. Hammer, professor of dairy industry at Iowa State College. W. A. Wentworth of the BORDEN COMPANY presented the awards at the annual meeting of the American Dairy Science Association at Purdue University. The awards consisted of gold medals and \$1,000 in cash.

The announcement of the National Farm Youth Foundation, sponsored by the FERGUSON SHERMAN MANUFACTURING CORPORATION and FORD MOTOR COMPANY, that an opportunity would be given to farm boys to secure training in farm engineering and management has aroused an unusual amount of interest.

The man in the center of the picture at the left is Roger Kyes, Director of the National Farm Youth Foundation. At the left is G. B. Sherman and at the right is E. C. Sherman, Vice-President and President respectively of Ferguson Sherman Manufacturing Corporation of Dearborn, Michigan.

If you are interested in securing further details, we suggest you write the National Farm Youth Foundation, Box 329, Dearborn, Michigan. The training provided is without cost to those young men who are accepted.

Poultry Records at a Glance

A LOT of record keeping is involved in the pedigree breeding of poultry. Here is a device on the Rice Farm at Trumansburg, N. Y., which puts some of these records in shape to be seen at a glance. Each row of nails on the board represents a breeding pen headed by one male, and each individual nail represents a hen. When a pedigreed chick dies in the brooder house, the wing band is brought in and hung on the nail representing the chick's dam. Most nails have no wing bands, but an occasional one carries several, indicating that that hen is undesirable and that she does not transmit livability to her chicks.

The top row of nails is unusually well supplied with bands as the result of an accident when the fire went out in the brooder house.

The same day this picture was taken, Johnny, shown at the right, and Jimmie, at the left, were putting pedigreed eggs in the incubator. Each egg was marked with the hen's number, and before the eggs from any breeder were put in the incubator, the record of previous hatchability was inspected and the eggs of any hen which had not

shown good hatchability up to date were discarded. Said Jimmie:

"There is no use putting eggs in the incubator if your records indicate that they aren't going to hatch into livable chicks."

Stop Cannibalism Promptly

AS THE early pullets go into the laying houses, there will be more and more people asking, "What causes cannibalism and how can it be stopped?" Others will say the same thing in another way: "Why do so many of the pullets rupture when they try to lay?" As a rule these people insist that their pullets are *not* cannibals, that the picking all takes place after, and not before, the rupturing.

That is a difficult question to settle. Apparently, sometimes these folks are right. More often they are mistaken. I have picked up pullets at random in such flocks and found black and blue marks around the vents. To me that means that there are some cannibal pullets in that flock deliberately trying to cause pick-outs. When that stage has been reached, I believe there is no stopping of the trouble short of adorning the beak of every pullet with one of the various anti-cannibal devices. Many thousands are used every year. They are at least 98 per cent effective. The entire flock can be equipped at the cost of a few pullets. Two men working together can put them on rapidly and easily after the first half dozen.

In small flocks it may be possible to locate and remove the cannibals by spending a day of alert watching in the laying pen.

Many explanations are given for the occurrence of cannibalism among pullets. Probably all have merit. I have come to consider differences in strains as one of the most important factors. Some strains of Leghorns, for example, are more active than other strains; perhaps no better layers either. Some are more scrappy than others. I knew a man who wore gloves when he picked up the eggs. His pullets always picked at his hands like a lot of broody hens. Why, then, can there not be a difference in cannibalistic tendencies between strains? In fact, it has been shown by Massachusetts that within their strain of reds there are certain families in which the number of pick-outs runs exceptionally high. Apparently some pullets will stand for it and others won't.

Of course, all this is no explanation where cannibalism occurs in one pen and not in another on the same farm with the same strain. No doubt feed is a factor. Milk, green feed, or even Epsom Salts are often helpful because of their laxative effect. Feeding less corn, but more oats, has been found beneficial. Darkening the nests or even

the entire room has been advised. It always seems that there is more trouble on very hot days. Perhaps high temperature makes the birds more irritable or increases the occurrence of actual eversions. So it is quite possible that to keep the houses cool and not overcrowded may directly reduce the losses from pick-outs.—L. E. Weaver.

More Names from First Poultry Course

ON Page 10 of the June 22 issue we published a picture of the first short course class at the New York State College of Agriculture, together with some of the names and a request for names of others in the picture. On page 17 of the July 6 issue we published some additional names.

The following letter comes from Elbert Corwin of King Ferry, New York, who is No. 13 in the picture:

"I was some surprised and very much pleased to see again the picture on page 10 of the June 22 issue. We had some time finding a place out of the wind and waiting for the sun to shine the day the photograph was made.

"Although I have met but few of the old class in the past years, I anticipate many pleasant moments in looking at the picture as it brings to memory many incidents that have been all but forgotten.

"I am now living in the Town of Genoa, just over the Tompkins County line, although most of my farm operations are in Lansing. Our farm, incidentally, is a portion of a land grant given to a Revolutionary soldier, Thomas Corwin, a brother of my Great-Grandfather, who settled on it in 1798. It has been in my family ever since. My son is now living on the farm.

"I believe I have had a reasonably happy and contented life and possibly the average luck, notwithstanding my number in the picture is 13, although for the last dozen years I guess we have all taken the hard knocks whatever our number has been.

"The only other member of the class whose whereabouts I know is No. 32. He is also a resident of the Town of Genoa, although his address is King Ferry. His name is Whitney Wager. You may hear from him personally as I think he takes your paper. There are two others who were members of this class who are not shown in the picture. Their names are John and Eben Rowland, both of Genoa.

"I assure you that I shall read the coming numbers for news of any of the old class who may respond to your request, and I also assure you that I will be interested in reading your paper as long as I am interested in anything in this life."

Pop's "PIE PLANT"

How an 80 Year-old Poultryman
Turned an Idea into Money

By G. T. KLEIN,
Massachusetts College of Agriculture.

AT DENNISPORT on Cape Cod is one of the best known poultrymen in the United States. Vacationists from Maine to Florida and from the Atlantic to the Pacific know "Pop" O'Brien and his famous chicken pies.

Born of the depression, pie making has grown into a real business for this genial old Irishman—and a profitable one too. In 1933, a hen would bring less than 75 cents, and that fell short of paying the feed bill—so something had to be done, Mr. O'Brien decided.

One bright sunny Saturday morning in July, residents and visitors in Dennisport saw "Pop" going to town with a wheelbarrow full of "something." He stopped in front of a vacant store, and with a small paint brush and some whitening began to write on the window. Here and there he placed a letter but so disconnected that no one knew the contents of his message. Finally it shaped into "Homemade Chicken Pies Like Mother Used to Make." Very liesurely this message was printed, and by the time it was complete, a curious crowd of 100 had gathered. In just ten minutes, twenty-one pies were sold at forty cents each.

"And when will you be back with more?" someone asked. It was all the encouragement he needed, and the following week he was back with 100, and after that 200 a week, with the record of never carrying one home.

Now "Pop" O'Brien has a small portable building that he hauls in on a truck and establishes himself at Dennisport on a vacant lot each summer. He has sold 10,000 of these pies, which is not a bad record for one who will be eighty years young this fall. Last summer he sold \$2500 worth of pies in ten short weeks, and in addition 1500 blueberry pies, hundreds of chicken sandwiches, and coffee and doughnuts.

During the winter Mr. O'Brien is a bonafide poultryman, maintaining a

flock of layers at the poultry plant on the bank of one of the Cape's numerous fresh water lakes. He has a nice retail route, and sells the surplus to the Brockton Egg Auction. Special orders for pies are filled, but the stand is only a summer feature.

The secret of his success in selling the pies, I concluded, is in the crust. Of this he makes no secret. As I sat in his kitchen at the poultry plant and sampled half of one of his pies, he gave me the recipes for the seasoning of the chicken and gravy and the making of the pie crust.

The best chicken for pies is a hen that weighs about seven pounds. Such a bird will make eight to ten of the small six-inch pies. The dressed chicken is cut up as for stewing and made ready for cooking in a kettle. First two onions for each chicken are cut up finely and placed in the bottom of it. Other seasoning consists of salt, pepper, celery salt, and poultry seasoning. Then he adds the chicken and lastly water to cover it. It will cook in two to seven hours, depending entirely on the age of the bird. It should come off the bones easily, but should not be cooked too much.

The recipe for the pie dough is:

- 1 cup lard or equal parts lard and chicken grease
- 6 cups flour
- 2 heaping teaspoonsful baking powder
- 1 cup water

The shortening is cut very fine with a wire shortening cutter and worked evenly into the mixture. The dough is handled just as little as possible, "Pop" cautioned.

The fingers that have rolled out so many pie crusts worked with a technique that would make many a home economics "grad" envious. Neatly the rich soft pie crust was placed in a pan. With lightning speed the edges were trimmed. The pie was filled with the previously cooked chicken and the rich delicious gravy. Then came the pie crust cover, and last a painting of egg yellow mixture with a pastry brush.

This mixture aroused my curiosity and prompted a question. One of the tricks of the game, I learned, is that burnt sugar gives "Pop's" chicken pie crust a rich golden brown. This little secret made me wonder about the rich yellow color of the gravy. A bottle of yellow vegetable coloring can color gallons of chicken gravy, I soon learned.

The pie was baked in the oven of a small oil stove with the temperature set at about 500 degrees. In just ten minutes I was eating the most delicious pie I ever ate, but only one-half of this rich pie was enough for me. This forty cent pie serves two, and the nine-inch pie serves five and sells for \$1.00.

Several others have been reasonably successful in selling chicken pies. Mr. O'Brien has been approached on the

proposition of spreading the "pie plants" as a chain. Twenty years ago it would have interested him, but not a man of eighty.

G.L.F. Locals Meet

The G.L.F. patrons are holding their annual meetings around the G.L.F. stores in New York, New Jersey, and Pennsylvania, and one of the interesting parts of the programs is the distribution of G.L.F. patronage dividends to farmers who have purchased their supplies through this organization.

The total patronage dividends for this year amount to more than \$1,200,000. This money, together with the good prices which dairymen in the New York and New England milk sheds are receiving for milk, have helped to bring better times to farmers than they have had before in years, and are another proof that "The Northeast Is a Good Place to Live."

FOR *Homemade* LIVING

By
MRS. GRACE WATKINS LUCKETT

HOME CANNING is one of the most important parts of "homemade living". To make the job go quickly and smoothly, it is essential to develop a routine or technique. Special equipment helps to make it easier—large kettles; a processing kettle either for water bath or a pressure cooker; sealing machine if tin cans are used; wire basket, funnels, ladles, strainers, enamel and wooden spoons and a proper supply of jars and rubbers.

And not only have your equipment on hand, but check it over every season beforehand to see that all is well. The gauge of the pressure cooker should be tested; all jars and lids looked over for possible cracks or chips; rubbers examined for springiness.

If the lid of a jar does not fit closely when put on over one rubber, remove the top bail, press down in the center to curve a little more, then replace in position. Two rubbers are not necessary. If tin cans are used there should be enough of the C enamel kind for corn and the R enamel for red and purplish foods.

Not more than 2 hours should be required in getting the food from garden to jar. Many vegetables and fruits taste altogether different if they stand any length of time before being processed, and also there is more danger of spoilage.

After gathering vegetables or fruits they should be cleaned, graded according to size, washed thoroughly and prepared, pared or cut if need be. Some fruits or vegetables need to be blanched or shrunk in order to save space in the jars. Fancy packs are time consuming and unnecessary for home use, but uniformity of pack conserves space and makes a better looking jar.

The hot pack has several advantages over the cold pack. It drives out air, reduces the amount of swelling during processing and is considered safer because of more uniform temperature throughout the entire contents of the jar. One-half inch of head space should be left at the top of the jar.

Correct Processing Important

Processing is important because upon it depends the killing of bacteria or molds which might spoil the food even though the proper precautions have been taken as to absolute cleanliness of hands, jars and food. Heat is necessary, and if too little is applied the rest of the work is in vain. Therefore, follow instructions carefully as to size of containers and length of time required for processing them. A complete seal is just as necessary in order to prevent entrance of bacteria after the processing has been completed.

Quick cooling is another necessity. When glass jars are used they must be kept out of drafts but the air should circulate completely around them. Tin cans may be plunged at once into cold water but never should be left to become lukewarm. After holding at room temperature for a few days, the jars should be stored in a dark, dry, cool place.

Fruits and tomatoes are processed with safety in a hot water bath because their acid content helps to prevent growth of bacteria and molds. The Bureau of Home Economics at Washington insists that all non-acid vegetables should be processed in a pressure cooker and they go so far as to say it is better to dry corn, beans and okra than to can them by the hot water bath. This is because in some parts of the country, certain dangerous bacteria multiply in canned vegetables. It is further advised that no canned vegetable be tasted before heating it thoroughly for 10 min. Even with a pressure cooker it is advised to pack the food hot. Fill just as many jars as the canner will hold, partially seal, process at once; complete the seal, cool and store.

With each pressure cooker comes a book of instructions for different vegetables. Time of pro-

Nothing sends a family into the winter feeling more secure than does a cellar full of vegetables and fruits canned at the height of their perfection.

—PHOTO BY DORMAND.

cessing varies from 30 minutes for No. 2 tin cans to 40 minutes for quart sized jars of asparagus to 90 minutes for No. 2 tin cans of cream style corn. Since the book of instructions will give exact processing time for each separate vegetable, I will not take the space to give it here. However, since many people still use the hot water bath for processing vegetables I am giving the proper processing time:

- 35 minutes: tomatoes
- 1½ hours: sauerkraut
- 2 hours: baked beans, beets with vinegar, carrots, mushrooms, parsnips
- 2½ hours: broccoli
- 3 hours: asparagus, lima beans, snap beans, greens, peas, pumpkin, squash
- 3½ hours: whole kernel corn, succotash
- 4 hours: Meat and Poultry

Directions for Processing Vegetables

(Allow one tsp. salt—bag, not shaker—for each quart of vegetable.)

GREENS, such as spinach, chard, beet tops, dandelions, broccoli, etc.: Pick over, wash thoroughly in several changes of water. Cook with water which clings to the leaves until nearly ready to eat. Pack whole while hot, into hot sterile jars, making a moderately firm pack. With a sharp knife, cut from top to bottom through the center of the packed jar. Add salt and boiling water to fill the jar. Partially seal, process according to table.

BEETS: Wash, retain 2 inches of stem and all of the root. Boil 15 to 25 minutes until skins loosen. Cold dip, remove skins. Add salt, bring to boil. Leave whole or slice. Fill jar to overflowing with liquid, partially seal and process.

CARROTS: Wash, boil 3 to 10 minutes. Cold dip, remove skins. Leave whole or slice; finish like beets and process.

STRING BEANS: Wash, cut and boil 5 min. Pack while hot, fill jar with water in which beans were cooked. Add salt, process according to time table.

SHELL BEANS: Boil 5 to 10 min. Pack loosely while hot and to within ½ inch of top of jar. Add salt and boiling water to overflowing. Process according to time table.

PEAS: Shell, boil 3 to 5 minutes. Pack to within ½ inch of top of jar. Add salt and water to overflowing. Process according to time table.

TOMATOES: Scald or blanch until skins loosen. Cold dip and remove skins, and core from the stem end. Cut tomatoes into pieces, place into jar, pressing down as each piece is put in. This makes the necessary juice. Continue until jar is full. Add salt, partially seal, and process according to time table.

PUMPKIN OR SQUASH: Wash, remove rind; cut in pieces. Cook until tender, pack hot, and salt and process according to time table.

CORN: Husk corn and remove silks. Boil on cob about 5 min. Cut from cob, taking care not to include hulls. Add salt and heat to boiling in water

to cover. Pack loosely while hot into jars up to within ½ inch of the top. Partially seal and process according to time table.

Fruits

The hot water bath is preferred for fruits. A syrup is made, the prepared fruit added and cooked until tender. Then pack into hot, sterile jars, partially seal, process 5 min. in hot water bath. Complete seal, cool and store. For watery fruits, oftentimes sugar alone is added instead of syrup. Allow from ¾ to ¾ cup of syrup for each pint jar.

The syrup may be thin, medium or thick according to the berry fruit which is being canned.

Each of the following fruits may be canned by the hot pack method in hot sterile jars, processing it partially sealed for 5 min. after filling:

RHUBARB SAUCE: Cut rhubarb into inch lengths and boil with 1 or 2 tablespoons water until tender. For each quart of sauce add ½ cup sugar, being sure all sugar is dissolved. Bring to boil, pack in hot, sterile jars and process as instructed above.

STRAWBERRIES: Wash, stem, allow ½ cup sugar per quart of berries. Place in kettle, alternating layers of fruit and sugar, having a layer of sugar on top. Cover kettle and set aside 10 to 12 hours. Heat slowly until sugar is dissolved, boil for 12 min., pack in sterile jars and process.

BLUEBERRIES, Blackberries, Currants, Dewberries, Elderberries, Huckleberries, Loganberries and Raspberries: Put the berries into a pan and add ¼ to ½ cup of sugar per quart of berries. Cover pan, heat to boiling point and boil the berries gently for 5 min. Shake the pan to prevent the berries from sticking. Pack them boiling hot into the hot sterile containers. Add as much juice as desired. Seal and process at once.

CHERRIES: Wash, stem, pit or prick with fork. Bring to boil in syrup—thin for sweet cherries, thick for sour cherries. Pack boiling hot into hot, sterile jars and process.

PLUMS: Wash, prick skins, bring to boil in thick syrup. Pack into hot sterile jars and process.

PEARS: Select firm, ripe pears. Peel and cook gently until tender in a thin syrup. Pack in hot, sterile jars and fill with boiling syrup. Partially seal and process. Variety may be added by having a cheesecloth bag of cloves or stick cinnamon in the boiling syrup. Then place a thin slice of lemon on the top of each jar.

PEACHES: Blanch, cold dip and cook until tender in thin syrup. Pack boiling hot in sterile jars and process.

Meats

Canning meat need not be confined to the summer season alone, but may go on almost the year around, including the fall and winter meat and chicken canning. If you have not already sent for our Home Service bulletin, No. 6, entitled "Home Canning and Curing of Meats", do so soon. It gives clear directions for canning beef, lamb, mutton, pork, chicken, and rabbit; also for curing hams and bacon. For a copy, write to *American Agriculturist*, Home Service Dep't., Box 367, Ithaca, N. Y., and enclose 3 cents to cover mailing and mimeographing costs.

TO A CANARY

By Alice Crowell Hoffman.

Yellow captive of the cage,
Teach me in singing to engage
When, like thee, I'm closely barred
By conditions that are hard.

Smart and Cool

THE MARKET is full of smart looking, yet comfortable materials for summer. Polka dotted black net with a white flower for trim and white accessories looks and is cool. And there's Swiss or organdie, either embroidered or eyelet; crease resistant voiles, beautiful ones; rayon sheers and all-over laces, both cotton and rayon.

DRESS PATTERN No. 3238 is flatteringly slenderizing and would make up beautifully in the daintier summer fabrics. Sizes 14 to 46. Size 36 requires 4 1/4 yards of 39-inch material for short sleeved dress and bolero. Hat Pattern No. 3144, one size, adaptable to any headsize, must be ordered separately.

PRINCESS FROCK PATTERN No. 3097 is especially good for youthful

figures. The neckline may be square or have a turnover collar. Sizes are 12 to 40. Size 16 requires 4 yards of 39-inch material for short sleeved dress.

TO ORDER: Write, name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our Summer Fashion Catalog.

Something Special for Picnics

WITH the picnic season in full swing, we want something a little out of the ordinary, so I suggest:

Toasted Picnic Buns

(serves 6)

12 picnic buns
2 No. 1/4 cans deviled ham
6 strips bacon
Dill pickles

Open buns enough to spread with deviled ham. Toast on sharpened sticks over open fire. When ready to serve, insert 1/2 strip crisp bacon in every bun. Serve with dill pickles. For supper dish, buns may be toasted in oven.

Nut Bread, sliced fairly thin and spread only with butter, always goes over big with the family as a sweet sandwich.

Nut Bread

4 cups flour
6 tps. baking powder
1 teaspoon salt
1 cup nuts broken in fourths
1 cup milk
2 eggs
1 cup sugar
2 tablespoons melted butter

Mix dry ingredients, beat eggs and milk together. Combine these two mixtures, add floured nuts and let stand 20 minutes in buttered pans. Bake 1/2 hour. This quantity makes 2 small loaves or 1 loaf and 9 muffins.

Tricks With Cranberries

Try serving chicken salad on rounds of canned cranberry sauce nestled in crisp lettuce. * * *

A slice of canned cranberry sauce plus a slice of chicken keeps the sandwich from being nearly so dry. * * *

Another bright idea is to flank a jellied chicken loaf with individual cranberry and cottage cheese salads. Beat orange juice into the creamed cheese and heap lightly on slices of cranberry sauce, lettuce leaves under, of course. Sprinkle the cottage cheese with grated orange peel. This makes a fancy refreshment tray which may be prepared hours in advance and kept in the refrigerator. * * *

For a delicious and nourishing drink, try this:

1 cup canned Cranberry Juice Cocktail
Juice of half an orange
1 tbsp. lemon juice
2 tps. sugar
1 egg
cracked ice

Put ingredients in shaker or in a bowl and either shake well or beat with an egg beater. If egg beater is used, do not add ice until after beating. Makes two 8-ounce glasses and tastes like more!

Aunt Janet's Favorite Recipe

With "garden sass" plentiful, there is no limit to the attractive salad bowls which can be prepared. The main thing is to have salad makings clean, crisp, and attractively arranged, with the right sort of seasonings at hand.

I always save the juice from peach or watermelon rind pickle and use it for dressing a chopped salad made of lettuce or cabbage, combined with almost any salad material I happen to have on hand,—celery, onion, raw carrot, chives, apple or cooked beets. Of course, French dressing is the standard recipe for most salad bowls.

The present vogue of serving salads from an attractive bowl, either wooden or otherwise makes this following recipe more useful than ever:

Country Salad Bowl

1 pint coarsely chopped salad greens
2 medium tomatoes, peeled, each cut into 8 sections
4 green onions or scallions
5 radishes thinly sliced crosswise
1/2 large cucumber peeled, split, seeded and thinly sliced
2 outside stalks celery finely sliced
4 tablespoons dry cheese, crumbled fine
6 tablespoons French dressing

Toss together lightly with a fork and serve immediately. Your own imagination will help you to substitute for any of these materials you do not happen to have.

This Chart Helped Me to Become a Jelly Champion!

Mrs. Kenneth E. Harris of Douglas, Wyoming, whose strawberry and red buffalo berry jellies, made with Certo, carried off first prizes at the 1939 Wyoming State Fair.

LOOK HOW CERTO SAVES TIME AND MONEY, GIVES FAR FINER FLAVORED JELLY, TOO!

THE OLD WAY

1. Mrs. A, after cleaning and crushing her berries, was ready to start making her jam at nine o'clock.

2. The red band on the kettle indicates the amount of fruit and juice that Mrs. A got from her berries (4 cups). The strawberries cost 16 1/2¢ a quart—2 quarts 33¢.

3. Mrs. A added 2 pounds of sugar to her berries. The sugar cost 5¢ per pound—2 pounds 10¢.

4. Following the old "pound per pound" standard recipe, Mrs. A had to boil the fruit and sugar about 30 minutes before the jam thickened to the desired consistency. This long boiling evaporated one-half of the original weight of the berries and carried off most of the natural fresh fruit flavor as fragrant steam.

5. When Mrs. A poured her jam, she found she had 6 glasses. The cost:
Berries.....33¢
Sugar.....10¢
6) 43¢
7 1/2¢

The 6 glasses of jam that Mrs. A made cost an average of at least 7 1/2¢ per glass.

6. It took 45 minutes for Mrs. A to make her 6 glasses of jam. It was nine-forty-five when she finished.

A product of General Foods

WITH CERTO

1. Mrs. B was ready to start her jam making at nine o'clock, too.

2. Mrs. B, using the same quantity of strawberries (2 quarts), got the same amount of fruit and juice (4 cups). Her berries cost 16 1/2¢ a quart—2 quarts 33¢.

3. Mrs. B added 3 lbs. of sugar (an extra pound because she knew none of her fruit juice would boil away). The sugar cost 5¢ per lb.—3 lbs. 15¢.

4. Mrs. B brought her fruit and sugar to a full rolling boil, boiled hard for 3 minutes, removed from the stove, and added 1/2 hottle of Certo. Certo is simply the jellifying substance of fruit in concentrated liquid form. At about 24¢ per bottle, the 1/2 bottle Mrs. B used cost about 12¢.

5. Mrs. B got 10 glasses of the same size from her berries. The cost:
Berries.....33¢
Sugar.....15¢
Certo (1/2 hottle).....12¢
10) 60¢
6¢

The 10 glasses cost only 6¢ per glass. Note how Certo pays for itself in increased yield... saves time and fuel, too.

6. Mrs. B's 10 glasses of jam were made in just 15 minutes. She was all through at nine-fifteen. And it had cost her nothing to use Certo!

AND WITH CERTO, IT'S EASY TO JELL ALL FRUITS --EVEN STRAWBERRIES AND PINEAPPLE!

Insist on

CERTO

Look for the tested recipes under the label of every bottle.

THE "TRIED AND TRUE" PECTIN THAT TAKES THE GUESSWORK OUT OF JELLY-MAKING!

Winter and August

by Romeyn Berry

THE WAY we farm up our road—which is pretty much the same way folks farmed hereabouts a hundred years ago—the work of our hands and the meditations of our hearts are constantly being directed toward one of two chief ends: (1) getting through the winter, and (2) getting ready for the next one.

In low moments, induced by long periods of unfavorable weather, wet hay and new varieties of pestilence in the vegetable kingdom, I'm apt to agree with Elmer that this part of the country is not adapted to farming anyway, and that George Washington made a big mistake in not letting the Indians keep it.

That sounds like an unhappy view of the situation, but it isn't so intended, and it really isn't. Getting ready for the winter has always been the basic urge back of all farming, and that mental approach to the appraisal of one's own efforts, chances and results is apt to produce the most cheerful conclusions.

On a hot Sunday morning in August, when you go out to the old orchard which is now the pig run, lean on the fence and scratch a shoat's delighted back with a sharp stick, it's much more wholesome to think, "Well, anyway this farm is going to have plenty of sausage and side-meat next February whether school keeps or not." Far better to think that, I say, than to muse, "Twenty-two years ago in that other war, Gwendolyn, you'd have been worth 19 cents a pound as you stand, and now nobody can tell whether you'll fetch 10 cents in December or only 3 cents."

When you are mentally raising shoats for the winter, rather than for the dealer, you can put the price of pork at anything you like; and that's the only way I ever heard of by which the individual farmer ever had any luck in trying to fix the selling price of his own commodity.

"At 8 cents a pound, or over, Gwendolyn, you're commercial pork; but at 6 cents or under, this family will have plenty of meat down cellar all next winter and O.K. for second helpings." That's the sensible way to view the economic situation, I think, when you're leaning on a fence in August. But it must always be remembered that you can't spend all of a hot Sunday morning scratching a shoat's back and figuring the December quotations on pork—not if you are expected to hitch up and get the family to church before the benediction.

We had a late, wet spring up our road, and most all farm operations are way behind schedule. Last year we finished haying on June 28, while this year it was July 9 before the gray team came in with the last load on the dead run. The practice of running the horses with the last load of hay is one which we still observe ceremoniously—but there wasn't any run left in me. The way I hobbled up to the barn on July 9 was more, my wife said, like the last few blocks of the G.A.R. parade.

Everything else seems to be late this year, and by just about the same number of days. I don't know that it makes any particular difference, except as consciousness of delay creates a sense of menace—makes one think too frequently about the coming winter when it's only August. Picking up potatoes isn't agreeable at any time, but I like it least when goaded into frantic haste by the wild geese in the gray,

cold sky. "Make it snappy, Big Boy," they seem to jeer. "We're down from Hudson Bay, and winter's just around the bend behind us. Any potato you don't get under cover before dark will freeze solid tonight!"

I prefer an early spring and a chance to do my farming in a dignified, leisurely fashion, unharrassed by wild geese and without having to count on my fingers, every time I hear a cricket, how many weeks we'll have 'till frost.

As a matter of fact, we're in pretty good shape, with no just cause for complaint, as August opens up; and that sense of being hurried by the lateness of the season is probably a salutatory stimulant—just enough of a spur to keep one from going fishing on a day when something ought to be weeded, or propped up, or sprayed. The hay's in, the wheat's in, and the oats are on their way down from the north lot. The corn has reached a point where it's reasonably safe from a number of things of which I can't remember the names. Potatoes, of course, are never to be regarded as secure until they've been delivered and the purchaser's check has had time to bounce back—and hasn't. But nothing bad has happened to our potatoes so far, which is about all one can say for his potatoes in August.

Down in the preserve cellar the long, glistening line of Mason jars is steadily lengthening out along the shelves and around the corner—peas, chicken, little beets, string beans, strawberry jam and cherries—with plenty of shelf room left for the corn, peaches, spinach and tomatoes that are nearly ready to make the pressure cooker sweat every day for weeks and weeks.

The root cellar, of course, remains practically empty in August. So far, there's nothing much down there but the big crocks of water-glass that are slowly filling up with peewees and pullet eggs that don't fetch enough to bother with when you sell 'em and which the family vastly prefer to big,

marketable eggs for breakfast. (They'd better prefer 'em.) I always say a slab of hot, buttered toast looks much more appetizing at breakfast when it has six poached peewees nestling on it than with just two jumbos at any time when jumbos command premium prices.

The bins and shelves in the root cellar, though empty, are cleaned and scrubbed, and we know exactly where the onions are to go and the potatoes, cabbages, beets, apples and turnips, providing nothing terrible happens in the next few weeks to the onions, potatoes, cabbages, beets, apples and turnips.

We seem to be in reasonably good shape for the winter—according to the general standards up our road and considering it's only August—but Elmer's sort of upset about the hay. The barn is so darn full of hay right now that nobody could stuff in another forkful. Unless it settles in the meantime, there won't be room to put the second cutting of alfalfa. We haven't enough alfalfa to make a respectable stack of it, and anyway a second cutting of alfalfa is much too good to stack outdoors.

All that creates a mean barn puzzle, but, as I tell Elmer, there's no sense worrying or losing our sleep over it. Mebbe that hay will settle enough in the bay to make room for the alfalfa; and even if it doesn't, we can always write our Congressman. We've got a pretty smart Congressman in our district who is up for re-election; and, man and boy, I've never seen a Congressman in an election year who couldn't think of something ingenious to help a farmer out of any hole between August and the voting.

"— and Son"

(Continued from Page 2)

"I get my fun right here on the farm," said Frank, "and I find that I can't stay up half the night and be much good on the farm the next day."

Planning for the Future

This seemed a good time to make some rather personal inquiries that had been in the back of my mind, so as diplomatically as possible I asked concerning a possible matrimonial venture for the junior member of the firm. The reply was distinctly in the negative, at least for the present. Frankly, I was

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines, and each poem submitted for this corner must be original and the work of an amateur poet. Therefore, when sending in a poem, be sure to state whether you are the author of it. \$2.00 will be paid for each one printed. Check will be mailed on or about the first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P.O. Box 367, Ithaca, N. Y.

Red Cross

I sewed today; the room was large and light
And many of my friends were there.
I made a dress—a size fourteen the pattern said;

And wondered, as I sewed, what girl
In what far distant land would wear it.

Oh, daughter of mine, what stress of time or circumstance
Could cause the women of an alien land
To sew for you?

For your sake in that dress of blue
I tucked a scarlet belt and handkerchief;
I took my turn at table and machine,
And as I cut and stitched I breathed a prayer:

Dear God, take care
Of two girls turned fourteen.

—Mrs. R. C. Spratford,
Cranbury, N. J.

a bit uncertain as to whether Frank is just too busy running the farm or whether the right girl hasn't appeared on the scene. I was interested in one point of definite agreement between parents and son; namely, that every young bride is entitled to a home of her own and that if in the future there should be a wedding in the family, the two families have no intention of living together.

"Now that you have been on the farm six years, let's let our imaginations run a minute," I said. "Suppose you had accepted a job instead of coming back to the farm?"

"For one thing," was the reply, "I undoubtedly would still be on salary. Probably I would have handled a lot more cash than I have here, but I doubt if I would have as much to show for it. Doubtless my working hours would be more definitely defined, and probably I would put less thought on business when I was away from the office. On the other hand, here on the farm I am free to take a little time off any time I wish, and that has some real advantages. There is one thing of which I am sure, and that is that I am glad I came back."

To this convincing statement, I have one comment to add. This father and son partnership, and many others like it, benefits both members of the firm. The son gets many advantages from such an arrangement. First, while the arrangements are businesslike in nature, they will certainly be more favorable than they would be for a stranger. Then he gets the benefit of the years of experience of his father, and the advantage of going into a business which is already established.

It might seem from this analysis that the junior member of the partnership gets the better of the deal, but that is not so. What does the father get? First, he gets a partner with an interest in the business which no money can buy. Second, he gets the unbounded energy, enthusiasm, and new ideas of youth. Third, he gets the satisfaction of daily work with his son. Lastly, and in my opinion most important, as time passes and he must necessarily slow up in his active participation in the business, he has the intense satisfaction of seeing the farm business thrive and increase instead of slowing up.

The Song of the Lazy Farmer

THE BOYS around these parts have got a ball game in the pasture lot; it ain't a major league but when the score is tied and there's two men that's out, and neighbor's hired man whams in a run why then you can just hear the yellin' for a mile or mebbe two, I know that I'll be hoarse a week but I don't care. When our game gits agoin' there, I wouldn't leave or stir my frame to see Bob Feller pitch a game, and Gabby Hartnett wouldn't be, on days like that, no treat for me.

When our ball game is goin' good we have fun in our neighborhood, there ain't a single thrill we miss, no game could be so good as this, we have home runs and everything except a no-hit game, by jing, but we don't want to play that way, we like to see them whale away and sock the ball into the trees. Some fellers slide upon their knees, and some come tearin' up the loam with nose and chin, a-slidin' home.

I don't suppose that Connie Mack would hire us, but when we whack the horsehide over second base we're proud as if we had a place upon a pennant winnin' team, we stand well in our own esteem, with all their feathers and their fuss, the Yank's ain't got a thing on us.

This is the Jethro Coffin homestead, the oldest house standing on Nantucket Island, Massachusetts. It was built in 1686, and is being maintained by the Nantucket Historical Association.

Personal Problems

Can't Force Interest

Dear Lucile: How can I tell if a boy really cares about going with me? I have dates with him occasionally. I am crazy about this boy. He doesn't even answer the letters I write to him. Please give me some ideas.—*Uncertain.*

Boys do not like to be bombarded with letters from girls, and if you keep writing this boy, without waiting for him to reply, you are doing the very worst thing possible; the one thing that may keep him from caring about you.

Let him take the initiative, both on making dates and writing letters. There's nothing you can do to force the issue. I am sorry to say that I'm afraid he isn't deeply interested.

* * *

Adjustment May Come

Dear Lucile: I am a girl of 18 and graduated from high school this year. I have gone with a boy for three years and care a great deal for him but somehow we seem to be kind of far apart from each other in our ways. He is jealous of me; doesn't want me to go and have a good time at any parties, or dance with any boys. He doesn't like any of my friends.

I've tried to please him by trying to get clothes he likes. I go with him whenever he asks me to go, except to dances because I cannot go with him and have a good time. I am a little jealous of him. We've been engaged about eight months but I always seem to do something he doesn't like.—*Troubled.*

I think a great deal of the trouble between you and the young man to whom you say you have been engaged for eight months is due to the fact that you are very young. It seems to me that you had better wait a couple of years before tying yourself down to this one young man by engagement, as certainly you would not want to marry him while a situation of suspicion and distrust exists.

I think as you both get older you will become more stable in your ideas and may be able to adjust yourselves better to each other. Of course, if you are engaged to a young man he is within his rights in asking that all your attention be given to him, and if you do not feel you are ready to do this it would be better that the engagement be called off.

* * *

Go With Others

Dear Lucile: My problem is this: I have been corresponding with a fellow for nearly ten months and in these ten months I have seen him three times. I love this fellow very much and I won't

IT IS EASIER to discuss a personal problem with an absolute stranger than with a friend, unless that friend be unusually intimate and understanding. If you have a problem, write to Lucile, Personal Problems Editor, American Agriculturist, Box 367, Ithaca, N. Y. Be sure to sign your name and give your address, as unsigned letters will not be answered. Names of all persons writing Lucile are kept entirely confidential, and if your letter is printed in these columns, your identity will be carefully disguised. Please enclose a self-addressed, stamped envelope if you wish a reply by mail.

give him up for anything. He told me when he was here I would make a swell wife and I have taken that for granted ever since.

"My mother says it's very silly for me to stay in and not go out and meet some one else. I cannot enjoy myself for the simple reason I think about this fellow all the time. I don't think I could be happy in my life without him.

He is a traveling man and never comes to my home town. I gave him a picture of myself and he seems to think the world of it. But it is going on a month now that I haven't heard from him. What could I write to him if he ever writes to me again to encourage him? What can I do? I will appreciate it very much if you will give me some advice.—*Correspondent Girl.*

It seems to me that the best thing you could do is take your mother's advice and cultivate other nice boys who may ask you for dates rather than spending all your time thinking about this man that you see so very infrequently and who is not very steady on the job of corresponding with you. Certainly I do not think you have grounds for considering yourself engaged.

Do not make the mistake of trying to force correspondence with him. You say he has not written for a month and I do not believe if I were in your place I would write him until he has answered my last letter. People traveling about the country can have a great number of interests, you know, and his may be divided between you and one or more others. I would not pin all my hopes upon him.

Good Books to Read

LATE HARVEST.—This is the story of an effort to force conformity upon the country gentry, of the clash of forces in the strongly nationalistic England of 1580, of families who strove to retain both their loyalty to their faith and to their Queen.—The Macmillan Company, New York. \$2.50.

Good Movies to See

ALL THIS AND HEAVEN TOO.—All who read Rachel Field's novel will want to see the screen presentation. The tragic story is of a noble French family and an English governess who tries to bring some measure of sanity and happiness into a home wrecked by an insanely jealous wife and mother. Bette Davis, Charles Boyer, Barbara O'Neill. Adults.

NEW MOON.—Jeanette MacDonald and Nelson Eddy in another of their screen successes. The family will enjoy the familiar tunes and the action-filled plot.

TOM BROWN'S SCHOOL DAYS.—Notable screening of the favorite classic, recreating the atmosphere of old England. Delightfully entertaining as well as socially significant. Sir Cedric Hardwicke, Freddie Bartholomew.

Today in Aunt Janet's Garden

Indoor Flower Pictures

BOWLS and vases are really the foundation of any flower arrangement and need to be chosen according to the sturdiness or daintiness of the flowers which they are to contain. Generally speaking, pottery is used for the sturdier flowers, glass or metal containers for the more delicate ones. Containers in neutral shades are more useful because they blend with all colors of flowers.

Arrangements fall generally into two classifications, line and mass. The former depends upon one or two spikes or stalks for its beauty, and every twig, leaf or bud must stand out and add to the picture. In mass arrangements the line is lost, and they depend for their charm upon color, shape and proportion; there should be a majority of one color and a smaller amount of another color or colorings.

The center of interest is where the lines or stems come together; here the accent should be placed, usually, the brightest or largest flower in the arrangement. One garden club demonstrator says that arrangements should have a nipped-in look at the base rather than a loose effect. An arrangement having several colors should have every color massed separately, rather than have them all intermingled.

Then too, it needs a diversified skyline as it were, with no two stems of the same length. If some of the flowers droop over the edge of the container, they serve to break an otherwise harsh dividing line. Other proportions to remember are to have about two-thirds flowers and one-third foliage, and the whole arrangement about twice, or twice and a half, the height of the container. These rules give a beginner a general idea, but an experienced arranger knows how to break the rules and still get an artistic effect.

Whether one goes in for making arrangements or just puts flowers in bowls, she will want to know how to keep flowers fresh. The main point is to cut them before they are full blown, put them deeply into cool water and stand them in a cool place for a few hours. Freshened in this manner, most flowers will stand up much better than if taken directly into a warm room. Use a sharp knife to cut stems, making a long, slanting cut. This exposes more of the stem to the water and prevents the stem from resting squarely

on the bottom of the container. Cut stems a little above their ends each day, and put in entirely fresh water. A really good scrubbing with soap and brush is good treatment for flower vases occasionally as it helps to prevent bacterial action which makes stems decay faster. It is good practice to pinch off leaves which would go under the water. Some recommend taking off two or three leaves above water, especially on chrysanthemums, snapdragons and similar plants.

Certain plants hold up better if the stems are held in boiling water for one minute, then put into cool water. The flowers should be protected from the hot steam or they will be blackened by it. Poppies, dahlias, heliotrope, hollyhocks, mignonette and most shrubs belong on this list. All flowers should be cut in the morning when their tissues are full of water. They should not stand in bright sunlight nor should they be in a draft.

Watch for Your Name

In this issue you will find names and addresses of a few subscribers which stand alone without references either to advertisements or articles. Why are they there? We call it our Hidden Name Game. If you find your name and address in this issue, drop a post card to us before August 10, and we will send you \$1.00 by return mail. The Hidden Name Game is meant to show us how thoroughly our subscribers read the paper and incidentally to provide you with a bit of fun.

"She says something about you going up a hill while she was baking a cake."

Kernels, Screenings and Chaff

By H. E. BABCOCK

AT VARIOUS times during the past few years, I have pointed out that our major political parties were changing their complexions so fast that in a few years not even a black Republican would be recognizable as such.

Now, the tickets of the so-called Republican and Democratic Parties go so far as to recognize by their very selection of candidates that the good old days are gone forever.

For example, the Republicans are running a Democrat, or at least a recent ex-Democrat for president; while the Democrats are running almost as recent an ex-Republican for vice-president. Yet no one could possibly think of Wendell Willkie and Henry Wallace belonging to the same party, while without a doubt Roosevelt and Wallace, at least, do belong to the same school of thought. *Neither is a Democrat in the old sense of the word.* They are New Dealers, the term that best describes them, and out of the wreck of the Democratic Party has risen the New Deal Party.

While the Democratic Party has definitely been replaced by the New Deal Party, the fate of the Republican Party is not quite so clear. . . . *Certainly, Willkie is not an old line Republican.* Had he been, the old liners would not have fought so hard at Philadelphia to stop him. Certainly, he is not an old Dealer, because he is not against everything the New Deal stands for.

What I rather suspect is that he is just a good old-fashioned Democrat. And so we have this fall, when everything is boiled down, merely a contest between a New Deal Party and a Democratic Party, with the old Republican Party dead in everything but name.

Combined Winter Barley

We have done just enough combining at SunnYGables to find what we are up against. Johnny has put in one afternoon on our field of winter barley. This was about the worst place he could start.

The barley itself is dead ripe and, despite the fact that I switched to a so-called stiff strawed variety, it is all lodged and about ten per cent of the heads, which are very heavy, are broken off. On most of the field the alfalfa seeding and weeds stand well above the barley.

We were prepared to have John report that he couldn't combine this field. But he struck in on it and was able to do about an acre an hour. A great

deal of grain is being wasted due to the heads breaking off, but none seems to be coming through the combine. And the grain is surprisingly free of green material.

I have an idea that if it keeps on raining that the heads of barley which have broken off will send up shoots and that there will be a tremendous crop of volunteer grain this fall. If only part of this grain lives through

the winter it should make a perfect mixture with the alfalfa seeding for a grass silage crop to be cut about the first of June next year.

Unfortunately, so far as we at SunnYGables are concerned, this crop is on a rented field and our lease is up this year, so it will not be available to use for grass silage.

One-Horse Hitch

Our two-wheeled English dump cart with which a fifteen hundred pound horse is supposed to handle a load up to two tons started us thinking about the greater use of one horse around the farm.

To begin with, we had to dig up a harness. And believe it or not, we could not find in the neighborhood of Ithaca a single harness big enough or strong enough for horses weighing from fifteen to nineteen hundred. We had to buy most of a new one.

Having got the harness and seen how

American Agriculturist, August 3, 1940

many jobs we could do with one horse and a dump cart, we have begun thinking about the greater use of one-horse hitches. During haying our teams are tied up and yet there is manure to go out nearly every day. So we have equipped our manure spreader with a pair of shafts. We have also equipped a lime sower, mounted on second-hand inflated rubber, with shafts.

The way we are proceeding with our adaptations of a one-horse hitch I am sure that by fall we will be doing more work with a team and a single horse than we have ever done with two teams. I also think that before another year is up we will be using a three-horse hitch more frequently on such jobs as plowing and dragging.

I do not expect to license our truck another year but to use our rubber-tired tractor and a trailer for all of the farm hauling jobs for which we have been using a truck, and to hire our road trucking done. The license fee and insurance on the truck will more than pay this bill I am sure.

No one who has not had the actual experience can appreciate the tremendous saving in draught which is made when horse-drawn farm equipment is mounted on inflated rubber tires and wheels are equipped with ball bearings. In these pictures, a schoolboy and a single horse are shown spreading manure with a seventy-five bushel spreader at SunnYGables. The rubber tires on this spreader are all second-hand 6.00 x 16's, and the entire set cost but six dollars. They will last indefinitely. Incidentally, the wheels on the spreader are all the same size and can be used interchangeably on a wagon, a mowing machine, a hay loader, a two-wheeled cart, a plow, and a lime sower. Improved bearings, more adequate lubrication, inflated second-hand rubber tires, and standardized wheel sizes, are all tending to protect the place of the horse in American agriculture.

Down Mexico Way

By H. E. BABCOCK, Jr.

July 19, 1940.

From my limited experience with farming in this irrigated country, and by reckoning all of the work that is to be done this season, I believe that we passed the peak of our work in the past two weeks. Our cotton is at the stage where we can cultivate only once more, the branches of the stalks having extended over the row until the fields are beginning to look like one green mass. We are watering all of our crops as rapidly as possible and we will keep the cultivators going behind the water for the final cultivation.

About all that I ever knew about raising cotton before coming here was that there was a boll weevil which was the bane of cotton farmers. So far, the boll weevil has not, and should not, become a problem here if the plant quarantine methods are effective. However, the whole Pecos Valley is in an uproar, and each farmer is besieging the county agent for a count of the injurious insects in his cotton field. These insects, the lygus bug, flea hopper, and various other relatively small

insects, are believed to be injuring cotton to the extent that dusting has been recommended. The dusting program recommended calls for dusting cotton each time that a so-called 15 per cent infestation is found in the field. Results as reported from one source seemed to justify the dusting until we started to figure how much an acre four or five dustings might cost. Having dusted our cotton once, we are listening to all arguments for and against dusting to determine whether the first dusting or subsequent dustings will pay.

There are two schools of thought as to how much an individual cotton plant can produce if all conditions are favorable. At frost time, a certain number of unfurled bolls are lost from the plant. One school believes that these bolls can be raised to maturity before frost if every condition is favorable. The other school of thought believes that on a given type and fertility of soil only so many bolls will mature. The injuries of the insects cause the bolls to drop now. Naturally, the lat-

ter school of thought believes that these will be replaced; while the others count them as an irretrievable loss. To date, we are playing it safe by believing the latter school, but by treating our cotton with every consideration to allow it to retain the maximum number of bolls.

At the present time, everything around the farm is at a stage when it promises the most. The wheatland maize heads are beginning to pop up throughout the fields, our third cutting of alfalfa is springing up almost in the irrigator's steps, and each day new blossoms appear and old ones drop from the cotton stalks. Five of our brood sows presented us with thirty-seven pigs the same week that we sold some one hundred and ninety-five pound pigs for \$6.65. Our ewe flock is dropping an occasional pair of twins, while our crop of baby mules has increased in number to seven. From Mother Nature's standpoint, we are well off and we can only hope for good prices when her work is done and we begin to market.

Conducted by H. L. COSLINE

Grievance Day

GRIEVANCE day for the review of town assessments is held the second Tuesday in August in most of the towns in New York State. It is held for the purpose of permitting property owners to present facts concerning changes which they believe should be made in their assessments. The property owner is interested in having his assessment reduced but after the consideration of his complaint on grievance day the board of review may reduce the assessment, leave it the same, or increase it.

In towns where there are three assessors, these officials hear the complaints and act as a board of review. Where there is only one town assessor, as is the case in some towns, the board of review includes the assessor, the town supervisor, and a member of the town board as provided in section 21 of the Town Law.

The purpose of grievance day is not to provide a forum for objections to high taxes but is for the purpose of making adjustment in assessments to provide a fair distribution of the tax burden as among the different properties in the town. In fairness to the assessors it should be recognized that they are not responsible for the magnitude of the tax burden, but that their function is primarily to provide equitable assessments among the different properties.

Under most circumstances, relatively few, if any, taxpayers appear to state their complaints to the assessors. Occasionally, however, when changes have been made in a large number of assessments or when there is widespread dissatisfaction, grievance day assumes real significance.

Property in towns is supposed to be assessed as of its value on July 1 each year. Most of the field work is usually done before July 1 and most of the book work after that date. The tentative copy of the assessment roll is to be completed by July 24. A notice is then posted indicating that the assessment roll has been completed, that a copy has been filed (usually with one of the assessors or the town clerk), that any person interested may examine the assessment roll, and that assessments will be reviewed on the second Tuesday of August.

In most towns the assessments of most of the individual properties remain unchanged from one year to the next. This practice is followed because of the disturbance that develops when assessments are changed and because of the amount of work which would be required actually to appraise each of the properties in the town every year.

In a few towns in the State maps of properties, together with a card index system of detailed information concerning individual properties, are available and enable the assessors to accumulate accurate information concerning values. In many towns, however, the only records maintained by the assessors are the assessment rolls of the preceding years. Under such circumstances it is not surprising that the assessments in some properties may get out of line.

Section 8 of the Tax Law states that "all real property subject to taxation shall be assessed at the full value thereof". The term, "full value" is not defined in the Tax Law but has been

clothed with meaning through court decisions. In general, full value as used in relation to farm and residential property is described as "fair market value established by the meeting of the minds of a buyer, willing but not compelled to buy, and a seller, willing, but not compelled to sell." A somewhat different definition has necessarily been developed in its application to other types of property such as that of public utilities.

From the standpoint of the problem facing the individual taxpayer on grievance day, he is primarily concerned with seeing to it that his property is not assessed higher in relation to its actual value than are other properties within the town. Consequently, if the individual taxpayer can show that his property is over-assessed as compared with other properties, he has a basis for presentation of his case on the second Tuesday in August.

Section 27 of the Tax Law states that complaints concerning assessments shall be filed under oath, specifying the respect in which the assessment complained of is incorrect. In practice the complaints of home and farm owners in rural towns are usually made and discussed orally and informally. Nevertheless, the taxpayer who appears before the board of review should have his objections to his assessment, in comparison with other assessments, in rather definite form and should not depend on a plea concerning the high level of taxes.

If a taxpayer feels that his property has been over-assessed and that he has not obtained justice on grievance day, he may petition the Supreme Court for a writ of certiorari to review the assessment. From a practical standpoint, however, such a proceeding is so expensive that it provides no remedy for the owner of a home or of a farm except under unusual circumstances

—M. P. Catherwood.

A Short Crop

Recently, Arthur T. Lelles of the Washington Mushroom Industries, Seattle, Washington, was indicted and convicted of using the mails to defraud. At the trial it was brought out that out of 6,000 customers who had bought mushroom spawn, only 52 had produced enough mushrooms to offer them for sale. The contention of the defense that the growers did not follow instructions carefully did not influence the jury.

I have suspected for some time that firms who advertise mushroom spawn on a promise to buy back the mushrooms were never seriously burdened by a heavy supply of mushrooms.

A subscriber writes us the following letter:

Fall Cows

Is it Wise to Turn Them into the Back Pasture and Forget Them?

A good cow that produces sixty pounds of milk a day during the early part of her lactation is actually putting more calcium and phosphorus into the milk pail than she can get out of the feed she eats.

These minerals must be supplied from the cow's body. Unless she was able to store up reserve supplies of minerals and fat while she was dry, she cannot continue to produce large quantities of milk for very long.

One of the good ways to reduce the cost of making milk is to pay a little special attention to the dry cows and see that they get enough of the right kind of feed to bring them into high production with ample stores of minerals and "condition." A few pounds per day of G.L.F. Fitting Ration will help get fall-freshening cows into shape for continued production.

The correct amount to feed depends on the individual cow and can best be judged by the feeder

Pasturing Sudan Grass

Sudan grass is becoming more popular every year as a short-season hay or pasture crop. It can be planted after the corn is in and still make a crop. If you are going to pasture sudan grass, remember that in the early stages of growth and when it has been held back by unfavorable weather, sudan grass may be dangerous to cattle. This danger can be minimized by filling the cows up with dry feed so that they are not hungry when first turned into sudan grass pasture. Do not turn cows into sudan grass that is less than eighteen inches tall, especially if it has a dark green color.

COOPERATIVE G.L.F. EXCHANGE, INC. . . . ITHACA, N.Y.

That Potato Patch Again After dusting or spraying potatoes once or twice and the bugs all seem to be killed, it's easy to put off further dusting or spraying. Wet weather is ideal for the development and spread of blight. There is no cure for blight. Only continuous dusting or spraying to keep all new and old growth covered with a thin film of Bordeaux Mixture will control blight. During wet, muggy weather, weekly applications of dust or spray may be necessary. If no bugs are present, use 40 lbs. G.L.F. 80-20 lime-monohydrated copper sulphate dust per acre. Dusting should be done when plants are wet and air is still. (Picture taken in G.L.F. test garden.)

Can You Beat This Pea Crop? Four bushels of peas from 15c worth of G.L.F. Alderman pea seed is the record set by W. G. Krum, Inlet Valley, near Ithaca. Here is Mr. Krum standing beside a 90-ft. row of Alderman peas which he planted on May 10, 1940. He used two-thirds of a 20c packet of G.L.F. Alderman pea seed and about 2 quarts of G.L.F. 5-10-5 fertilizer in the row. Picture taken July 9.

A Good Time to Paint Few things give a man so much satisfaction and pardonable pride as a neatly painted set of farm buildings. Mr. Seymour Dartt, of Spencer, N. Y., painted all his buildings with G.L.F. paint about this time last year. His barn is pictured here as a reminder of two things:

(1) August is a good month to paint, with the cows on pasture and most of the crops harvested, and warm, dry weather (we hope) to make the paint dry.

(2) G.L.F. paints are made specifically to meet farm needs and to stand up under farm conditions.

A Show Window for Agriculture

**The STATE FAIR
POINTS the WAY to
BETTER FARMING
and BETTER LIVING**

WHEN the gates of the huge 257-acre, \$5,500,000 State Fairgrounds in Syracuse are thrown open Sunday, August 25th, to usher in the 100th Anniversary New York State Fair, the throngs will rush in, intent only upon being entertained, enlightened and amused. But, though few will pause to think of them, there are powerful stories behind the history of the State Fair . . . too many to recount, all of them a mirror of their times.

Back in 1841, when the Fair had its start, thanks to the energy of a small group of men, it was smaller than the smallest of our present day county fairs. Before it reached any size many years had passed. For one thing, harassed by bad weather in some years and hard times in others, it led a gypsy-like existence, moving from place to place.

It was not until fifty years ago that it was settled finally in Syracuse. Now it is well-rooted. It is a big institution, conducted by the state and representing the contributions of countless thousands who helped in some way or other to make it the mammoth exposition it is.

Down through the years, it has done much to encourage the ceaseless drive for a better way of life. It has been the display show room of farm machinery, of household appliances and of food products. By the same token, it has been the show window of the state, for the finest of farm products and the best of cattle, sheep, swine, horses, and poultry have been displayed by the farmers.

Interest in life on the farm has been spurred in many ways by the State Fair. It has given a competitive zest to farmers, to their wives, and to their children. Particularly has it spurred 4-H and F.F.A. work, for each year the exposition serves as the grand climax for efforts of the youth groups.

The State Fair is pretty much of a living thing, not unlike, in many ways, a magazine or a newspaper. Not only does it represent the present, it must take a prophetic glimpse into the future, for out of these prophetic glimpses

come the improvements in our way of living.

Thus the State Fair program moves on, changing from year to year, retaining what the people want, introducing things which, it is believed, people will want.

This year the State Fair Program does this, and what's more, to mark the Centennial, it is to present a huge historical spectacle entitled "The Paths of Freedom" which will retrace the passing of the years and depict the history of New York State from the time of the arrival of the first white man to the present day.

It is a large order but the pageant is built on mammoth proportions. It will have a cast of 1900, a stage 600 feet in length, and will be directed by professional producers and presented with striking scenic and lighting effects.

The State Fair, from all indications, will be in keeping with the Centennial. Confined to nine days and nine nights, it has drawn a record number of commercial, farm equipment and household appliance exhibitors. It has also drawn record entries in virtually every agricultural and livestock class, due to two

An air view of the five and a half million dollar home of the New York State Fair. Here, from August 25th to September 2, you will see the latest and best in farm machinery, home equipment, farm products and livestock.

principal factors, the running time of nine days and the record sum of \$150,000 offered as prizes and premiums for a fair of that length.

The program is regarded as unusually well-balanced, with the agricultural phases of the fair closely matched by the entertainment features. The Fair has been able to secure the finest horses for the six-day Grand Circuit Meeting, outstanding circus, hippodrome and vaudeville acts for the grandstand performances and many headline attractions.

The 100th Anniversary will present many innovations. Chief among them is a five-room model home, designed to present the latest in home design and construction; an Indian arboretum, the only one of its kind in the world; a winter wildlife show, an ambitious undertaking staged through the cooperation of the State Department of (Turn to Page 25)

When Pullets Move from Range to Laying House

WHEN PULLETS ARE MOVED to laying quarters, they go into a different world. Housing, feeding, and laying conditions are new and strange.

The change is swift, but it should not be violent. That is why many poultrymen prefer to do the moving at night when the birds are quiet. Not only are they easier to handle, but they suffer less from excitement and nervousness during the shift.

Cull Closely

Moving day is the best time to cull the pullets. Undersized birds and those that have not yet grown combs should be left on range where they will develop better; dispose of the weak ones and any that show signs of disease.

Old hens should also be closely culled before they are carried through a second winter. Your County Agent can advise about culling.

Check Laying Quarters

Laying quarters should of course be perfectly clean when the pullets go into them. There can be no compromise with cleanliness.

Plenty of light in the hen house is fine, but too much light on the nests may encourage picking. A separate, darkened nest room, or nests that open toward the wall, help solve the pick-out problem.

That means taking out all movable equipment, scrubbing and disinfecting it; painting roosts, dropping boards and nests with Red Mite Killer. Sweep down the walls and white-wash them or spray with disinfectant. Clean the floors and put down new litter. Check the windows and ventilators now to see that they will open and close easily after the cold weather comes.

If the laying flock is going to be bigger than last year's, be sure there is enough room. Allow

3½ to 4 sq. ft. floor space per bird (heavies need about 5 sq. ft.)

8 inches roost space per bird

12 feet hopper feeding space for each 50 birds

1 nest for every 6 or 7 hens.

A Critical Period for Pullets

The first few weeks of egg production put a tremendous strain on the bodies of pullets which are not yet fully grown. Immature pullets must fill out, develop size and body capacity, and put on flesh at the same time that a great part of their feed is being converted into eggs and egg shells.

The feeding program developed by G.L.F. enables poultrymen to carry their birds through this critical period without upsetting their feeding habits.

Each of the G.L.F. laying mashes is made from some or all of the ingredients used in Starting & Growing Mash. These ingredients are put together in slightly different proportions to give laying birds the extra amounts of proteins, minerals, and vitamins they need.

Changing the Feed

These mashes are so similar to Starting & Growing Mash in taste and texture that

poultrymen have no difficulty in changing their birds to the laying mash overnight. Some poultrymen, however, prefer to make the change gradually.

The G.L.F. mashes are formulated to be fed 50-50 with scratch grains. The simplest method is to feed the mash dry, and most flocks do well on this plan. Later on, if feed consumption needs to be increased, a wet mash once a day will help stimulate appetites. Pellets have the same effect. They cost more, but are less trouble to feed.

New Dairy Feed Formulas

CORN IS HIGH in comparison with other grains and by-product ingredients. Coconut oil meal, soybean oil meal, cane molasses, and ground barley all supply total digestible nutrients (T.D.N.) at less cost than corn.

To make use of these lower-cost feeds, the G.L.F. flexible formula dairy feeds were adjusted August 5. The new formulas contain less wheat bran, less hominy feed and corn meal. Ground soybeans are eliminated because the other ingredients furnish plenty of fat.

Total digestible nutrients in the new formulas are practically the same or slightly higher.

G.L.F. Super Feed formulas remain unchanged.

Horse Power

JOY, THE REGISTERED PERCHERON FILLY shown in this picture is owned by Mr. Homer Lathrop, Sherburne, N. Y. Joy was foaled on May 20, 1939 and on May 19, 1940 she weighed 1170 pounds.

This remarkable growth in one year indicates that Joy comes from good stock and that Mr. Lathrop knows how to raise horses.

Joy was weaned in September 1939. From that time until she was turned out to pasture, she received 8 quarts per day of G.L.F. Fitting Ration. Mr. Lathrop says that at first this was all the dry feed she would eat, but in a few days she began eating a little hay and steadily increased the amount of hay she would clean up.

COOPERATIVE G.L.F. EXCHANGE, INC.
ITHACA, N.Y.

MUCK GROWS GOOD CELERY.—Frank Vanacora of Port Byron, N. Y., knows how to grow celery. Twenty acres of muck are devoted to this crop, plus five acres of onions, seven of potatoes, and six of carrots and beets. This celery is being bleached with paper, which is held close to the row with strips of iron bent in the form of a "U". Part of the crop is bleached with boards which have been in use for years and which Mr. Vanacora is conserving, knowing that new lumber is too costly to use for this purpose. As the boards become unfit to use, they are replaced by paper.

We Irrigated Our Potatoes

By J. M. BURDICK.

OUR FARM is located in a valley in north central Cattaraugus County, N. Y. It is not in a commercial potato growing region. The soil is a coarse gravelly loam, and we have grown potatoes on the same field for the past six years. Ryc is plowed under in the spring, the seedbed fitted and potatoes planted as early as possible. In 1939, planting was completed May 2nd. We added eight tons of manure and 600 lbs. of 10-20-10 fertilizer per acre.

Drought conditions were not serious in our county in 1939. The potatoes did not seem to lack for water until the tops were fully grown, although we later found that the set was light. Our potatoes came up very uneven, about 75% of a stand, and at the time they were in blossom, a 150 bu. yield looked high. We started irrigating July 1st, when the tops had started to wilt and the lower leaves were dead.

To figure the profit from irrigating

our potatoes in 1939 it is necessary to find first the cost of applying the water. The water was pumped, electricity was used for power, and we irrigated the field three times. The water was applied by means of 1,000 ft. of portable overhead pipe, divided into three lines for convenience in handling and operation. The lines were moved each day, and watered a strip 1,000 ft. long by 50 to 60 ft. wide, putting on about 2½ acre inches of water in 22 hours. About one acre was irrigated each day.

The original cost of pump, motor, pipe, fittings, oscillators and wiring was \$1200. We charge \$100 each year to depreciation and now value equipment at \$800. Interest on this amount at 5% is \$40. And now for the only cash expense during the year, the electricity used to run the pump, which cost \$15. This makes a total expense of \$155 for equipment and power. 150 man hours were used in laying feed lines—which are temporary and have to be laid and taken up each year—and in moving the overhead lines each day. 150 hours at \$.30 per hour is \$45. This plus the \$155 power and equipment expense, makes \$200 for 8 acres, or \$25 per acre for applying 7½ acre inches of water.

The potato plants responded very quickly to the water and by the time we were going over the field for the third time we could hardly walk through the vines. Digging was started August 1st, when the tops were still green, and over half of the field was dug before the potatoes were ripe. We finished digging Sept. 15th, with a crop of 3,680 bu. from the eight acres or 460 bu. per acre. We sell the potatoes as we dig them so these bushels were all weighed, 60 lb. bushels, except 200 bu. of seconds that we put in storage for seed. Ninety per cent of the crop graded No. 1. Without irrigation we would have had a larger percentage of seconds, but this benefit, if considered, would only be a guess.

The difference between 150 bu. per acre or less that I feel sure would have been our yield and 460 bu. that were actually dug, is 310 bu. that may be safely credited to irrigation. Another benefit of irrigation on the crop is the

The winnah—and still champ! Harold "Buck" Stanton of Cohocton, Steuben County goat-milking champion, added the championship of Allegany County to his laurels when he defeated Ben Allen of Belmont at the recent Western New York Dairy Field Day and Bull Sale held at Angelica. Mr. Stanton, dressed in milk maid's outfit, milked 10 pounds in 5 minutes, to the 7.8 lbs. milked by Mr. Allen.

A Pair of "Pullers"

IT'S A thrilling sight at county and state fairs when a team of well-trained horses show what they can do. The dynamometer, now universally used in horse-pulling contests, registers the exact pull and makes comparisons between teams accurate. Taken a year ago, this picture shows a team of strawberry roans, eight and nine years old, owned by Harold Evans of Georgetown. They won the local contest and represented that area at the New York State Fair.

When you attend your county or State Fair, look over the program and be on hand when the horses start pulling.

satisfaction of seeing the potatoes come to harvest with a yield that makes the grower feel that he has been well repaid for a year of planning and several months of hard work. It is a good kind of crop insurance any year and a real benefit under drought conditions.

Soybeans As a Vegetable

A few days ago I had a new experience. I was invited to a friend's house for dinner, where we were served with baked soybeans. They were good. Reports from quite a number of people who have tried them vary considerably. Some like them very well and others are less enthusiastic.

Soybeans as a vegetable have two uses. They can be shelled out and cooked very much as lima beans, or they can be allowed to mature and stored for baking as a possible change from baked beans, the old stand-by.

If you get an opportunity, try some. Then you may wish to grow a few in the garden next spring. Put them in rows and inoculate the seed when you plant it. Your farm supply store should have this inoculant and the package will give directions for use. Put them in just a few days after corn-planting time.

The question of variety is important. Not all varieties that are recommended for eating will mature in most parts of the Northeast. Four varieties that are recommended are: Hakkaido, Jogan, Banfei, Hakote.

Professor R. G. Wiggans of the New

York State College of Agriculture has been interested in edible soybeans for several years. Last spring, as long as the supply lasted he offered to send to any farmer in New York, New England, or northern Pennsylvania one pound of each of the four varieties mentioned for the price of \$1.00.

—H. L. C.

Milk No Place for Strings

Could you tell me what makes cream stringy even before it is 24 hours old? I would like to have this information as soon as possible.

Stringy milk or cream is caused by a particular type of bacteria. When the bacteria multiply, they do not separate but hang together in chains and become so numerous that they impart a stringy characteristic to the milk. It is believed that this type of bacteria is sometimes picked up by the cows in marshy pastures. Once it gets a start in the milk, it is difficult to eradicate. This type of bacteria grows at a lower temperature than some others. Therefore, refrigeration does not provide adequate control.

The remedy is to sterilize with unusual care every piece of equipment with which the milk comes in contact. If you miss one piece or if you fail to sterilize one piece of equipment completely, the milk is reinfected, and soon the situation is as bad as ever. The use of liberal quantities of boiling water, and we mean boiling, on every piece of equipment should correct the trouble.

JOHN V. EARLS and ALBERT SEWELL, Washingtonville, Orange County, New York, are the only two Negro farmers in that section and, probably, are among few of their race farming on large scale in New York State. Three years ago they leased from their former employer, C. R. Shons, long known as "Apple King" of Orange County, forty-seven acres of his fruit farm and have been operating it since.

Test Your Weather Lore

ARE country weather prophets right when they claim that mornings when there is no dew are likely to be followed shortly by rain? If so, why? Turn to Page 18 for the correct answer and see how near right you are.

Why I Go to Fairs

I LIKE to shed these "store clothes" that I have to wear much of the time, and get the freedom that comes from a pair of overalls and an old shirt. I like to get into the big kitchen and eat from a table covered with a bright oilcloth. I like to go to fairs. All these things help me to turn back the clock and make me feel like a boy again.

All of you who were farm boys and girls whose memories go back into the horse and buggy days know just how I used to feel about the old country fair, how we used to look forward to it, with its great clouds of dust, its exciting ball games, the marching country band, and of course, the merry-go-round—don't forget that—the side shows, and the best girl.

So I still go to fairs, and this is Fair Time again, and the New York State Fair at Syracuse, and the Eastern States Exposition at Springfield, Massachusetts, have all of the thrill that the old-time fairs had, and more, much more. If you live in New York State, just read the plans for the New York State Fair on Page 1 of this issue (New York Edition) then turn to pages 24 and 25 and read the detailed program for each day. I pity the fellow who says that he never goes to fairs any more because if you have been once you have seen it all. There is something the matter with his spirit. A lot of people go through life just like that, and what a lot they miss!

Your Patronage Dividends

UNLIKE any other publication, *American Agriculturist* is owned by a Foundation, which holds all of its stock and other assets in the name of its subscribers. That makes you a member of a great cooperative publishing organization, with more than 190,000 subscribers, a vast army working for the interests of northeastern farmers every minute.

Like other cooperatives, the subscriber owners of *American Agriculturist* share in any profits. You share first through the use of those profits in making a bigger and better paper to work for your interests; and you share, secondly, through the use of those profits to help farm boys and girls of the Northeast to complete their education.

Also, *American Agriculturist* is not serving some individual publisher, bending our editorial policy to suit his whims or his profits. Instead, we are free to serve you. That's the reason why I am continually asking your advice and suggestions, and wish you would write even more letters than you do.

Also, I want to call your attention to the fact that every time you fail to renew your subscription and we have to write to you about it or send a representative to see you, you are increasing the costs of the paper and cutting down the profits which might otherwise be used for constructive purposes in your interest.

Under the ownership of *American Agriculturist* Foundation we are now publishing one of the best farm papers in the United States. We are particularly enthusiastic over the issues this summer. Are you following them? If not, you are missing a bet. The paper is just filled with stuff to help you make and save money, and with thought provoking articles to help you live and get some happiness, something that is particular-

ly necessary in these bad times. Therefore, from many standpoints, you just cannot afford to be without this paper or fail to read it when you get it. Look up the date of expiration on the front page of the last issue, and if your subscription is anywhere near expiration, renew now while you think about it. Speak to your neighbors about it. *American Agriculturist* needs you, and you need *American Agriculturist*!

What's the Hurry?

CONGRESS is in an uproar over the proposal for a draft of practically all the manpower of the nation for military training and war. An apparent effort was made to put the draft bill through in a hurry, but as the people back home began to realize the wide scope and drastic provisions of the proposal, they became aroused, with the result that thousands of letters and telegrams have been pouring into Congress.

The people are not so much opposed to a limited draft itself as they are to the attempt to put it over in such a hurry that there was no chance for proper consideration by those who will have to shoulder the guns and pay the taxes, the people themselves.

The opposition has led to many modifications and amendments. What's the hurry anyway? Leaders in Congress seem to be afflicted with war hysteria, which has warped their judgment. Talk about a democracy not being able to move fast. Within the space of a few weeks Congress has passed appropriations running into the billions for defense, which will require generations to pay back in taxes. That's all right. Nobody objects to adequate defenses providing the money isn't wasted. It is necessary, too, to get adequate man power, but not until after there are guns and munitions for the men to carry. Also, we have a voluntary system in this Republic which has worked pretty well, and it should be given a chance to operate before the undemocratic draft in peace times.

The pay for a soldier is absurd, something like \$20 or \$22 a month, less than the boys are paid in CCC camps. Why not increase soldiers pay as one inducement to volunteers to enlist?

In short, let's prepare, of course, but let's have more common sense and less hysteria.

Were You Ever Hungry?

AS I SAT here at my desk thinking of the great famine which is almost certain to visit Europe this winter, I wondered how many of my readers have ever known what it was to be really hungry. I thank God that I don't know what that feeling is, and that you don't, because we live in a land of plenty where there is enough to go around even in hard times, so much, in fact, that we often have surpluses that we don't know how to handle.

But millions in Europe will feel the bitter pinch of hunger and probably many will die. Such a great catastrophe seems new and strange to us, but famines have been frequent in history. You all know the story of Joseph in famine times in Egypt. Four hundred and thirty-six years before Christ there was a famine in Rome, and thousands of starving, desperate people threw themselves into the Tiber River. In 879, A. D. there was what was known as a universal famine. Food was short in all the known world, and thousands died. In 941, and about a hundred years later, in 1022, and again in 1033, famines were so terrible in India that people of entire provinces died, and the strong ate the weak. In 1016, just before the Normans under William the Conqueror invaded England, there was a great

famine throughout Europe. In 1162 there was another world-wide famine. Between 1396 and 1407 there was a famine in India that lasted twelve years. In 1769, just before our own American Revolution, there was a famine in India which destroyed 10 million people. From 1790 to 1792, during the administration of our own George Washington, there was another famine in India called the Skull Famine because people died in such numbers that they could not be buried, and known as one of the worst famines in all history. In 1846 and 1847 the potato crop failed in Ireland. Potatoes were the main livelihood of the people, and the failure of the crop caused a great famine and large immigration of Irish people.

So it goes. So common are the famine conditions throughout much of Asia and in Russia itself that there is often little mention of it in our own American newspapers.

In recent years British rulers of India have been better able to control famine conditions which result from natural causes. What cannot be controlled are the deadly results, including famine, of a great war like the one that is now raging over most of Europe.

For Better Apple Marketing

AS WE come to the beginning of another season for the marketing of apples, what can the individual grower do to increase apple consumption and to build up a market for this splendid fruit? Here are just a few suggestions:

1. Don't ruin the consumer's taste for good apples by feeding him with seconds. He will buy poor apples just once; the next time he will buy oranges.
2. Put your good quality stuff into an attractive package.
3. Both as an individual grower and as a group of apple producers, study the way merchants handle your apples, and urge them to handle them carefully and to display them prominently and attractively.
4. Get back of the New York and New England Apple Institute, which is doing a fine job in increasing demand for northeastern apples.

Another Farm Boy in High Place

FRANK E. MULLEN, farm boy of South Dakota, graduate of the Iowa State College of Agriculture, farm editor, and for years Director of Agriculture of the National Broadcasting Company, has just been elected Vice-President and General Manager of the National Broadcasting Company.

It is always good to know when one's friends are promoted, and it is especially so in this case, because Frank not only is one of the grandest chaps in the world, but it is valuable to farmers to have men like him with farm background and training in high places.

Eastman's Chestnut

MAYBE this story will help some of you out: "Will", said a newly married friend to Will Maupin, the Nebraska poet, "I'm put to it to know just what to call my wife's mother. I don't like to call her 'mother-in-law' on account of all the comic paper jokes on that name, and somehow there's a certain sacredness about the word 'mother' that makes me hesitate to apply it to any but my own."

"Well", said Maupin, "I can only tell you of my own experience. The first year we were married I addressed my wife's mother as 'say'; after that we called her 'grandma'."

Will War and Famine

By E. R. Eastman

Raise your Prices?

THE AWFUL spectre of famine hangs like a great black pall over Europe and its millions of people. Hand in hand with starvation will travel disease, disorder, revolutions, whirlwinds of disaster set in motion by the God of War.

How will the grim results of war affect the markets and the prices for the products of your farms? On a long time basis, the effects will be exceedingly disastrous for farmers as well as for everybody else. Billions in wealth cannot be blown to ruin without eventually all of us paying, and paying hard. Temporarily, however, the war, directly or indirectly, will increase moderately the price of many farm products. What we don't know now is whether the war will be long or short, whether England will be able to check and turn back the Germans, or whether they will march through the streets of London. But whether the war is long or short, and no matter who the victor is, there is certain to be a great shortage of food in Europe next winter. How bad the famine will be will depend on how effectively the British can maintain their blockade of the Continent, thereby shutting off food supplies. And whether the British Isles will also suffer from food shortage will depend on whether or not Britain can keep control of the high seas.

Europeans Likely to Starve

In any case, millions of Europeans this winter must look to other countries for food, or starve. Their own supplies are dwindling fast. Hundreds of thousands of acres of good European lands have been overrun by soldiers. Thousands of these soldiers were farmers, taken out of the production of food for military purposes. Nature herself joined in the crisis by giving Europe a wet, cold spring, further cutting down the crop acreage and decreasing the yields this season.

Pure Bred Herds May Disappear

It is reported, probably with truth, that the fine breeding herds of Europe, which farmers have been generations building up, have been or are being eaten by the armies, much as grain is destroyed by a flock of locusts. These herds include the Holsteins and other breeds of Denmark and Holland, and probably the Guernseys and Jerseys of the Channel Islands. Thus is famine brought nearer day by day by the destruction of these herds, and by the difficulty of getting food for cattle still alive. And destroyed also are the results of a hundred years of careful breeding.

The destruction of these herds and of flocks of poultry will probably have little effect at present, on American dairy and poultry prices, unless England herself later finds it necessary to buy, and is able to pay for, American butter, cheese, and poultry supplies. Increasing demand here at home plus good organization plus the marketing agreements are best assurances of continuing fair to good milk prices at least for a time.

American apple growers have already felt the effect of the loss of the export trade in apples caused by the war. Exports of fruit this year will undoubtedly be smaller than ever.

Sheep growers can be reasonably optimistic about the future. Both sheep and wool are held now at comparative-

ly low prices. Undoubtedly the big increase in our Army will create a large demand for wool, even though there may be no increase in wool exports. This demand should lead to better wool prices.

Wheat in Europe this year is reported to be about half a crop. There is, however, a big carry-over, which will help some. Therefore, American wheat growers probably should not expect a return to dollar wheat, and livestock and poultry feeders here will probably continue to buy wheat feeds at reasonable prices.

We Can't Get Food Over There

Even though a famine rages in Europe, it may not greatly increase the exports of American farm products, and no farmer should count on the soaring prices that occurred in the other World War. One reason for this is that there are grave difficulties in getting food to those who need it in Europe. How can it be got by the British blockade to the Continental peoples? And even though we can get it by the British blockade, should we take the large chance of letting our food fall into the hands of Britain's enemies, thereby helping them to carry on the war? Then, again, if the food can be delivered, what will the Europeans use for money with which to buy the food?

Dr. William I. Myers of Cornell points out that the United States is rapidly becoming a creditor nation, but we do not know how to finance other countries so they can buy our food. We now have most of the European gold; therefore, they cannot use that to buy food with. We are not much interested in bartering, because we don't want to accept many of their imports in exchange for our exports. If we loan money in great chunks to European nations, we know from the sad experience of the other war that it will never be paid back. So about the only way Europeans can get great quantities of our food is on a charity basis. We would have to give it to them, and there is a limit to what we can afford to do on that basis.

U. S. Food Exports Not Important

Too much emphasis is placed on American exports of farm crops any-

Helpless French war refugees on the march. Famine and disease are next in order. Millions of Europeans already literally do not know where the next meal is coming from. How will this affect demand for United States farm products? Read the article on this page.

way. Exports of food were less than 2 per cent of our total production in the year 1935. Food exports are probably even less than that now. Therefore, so far as the export of our food production is concerned, we could easily take up the slack if we lost all of it.

The decline of export trade, however, does work hardship on tobacco, wheat, and cotton farmers. With the loss of the foreign trade for these products, some farmers will have to make real and difficult adjustments. Hardship may be worked, also, on certain other farmers temporarily, because the war has interfered with some imports like cabbage and cauliflower seeds, and bulbs. However, plans are already under way to make up these deficiencies on this side of the water. If interested in these crops, I suggest you buy your seed supplies early.

Why Prices Are Going Up

But while the war may not have much effect in increasing our exports, it is certain to have, in fact is already having, an effect on farm prices by increasing consumption of consumers who now have jobs because of our huge defense program. Mr. Herbert King, President of the New York State Farm Bureau Federation, points out that there never would be any surplus in this country at any time if everybody had all they wanted, and the only limitations on their getting all they want are good jobs and wages with which to buy more food and clothing. Therefore, northeastern and other American farmers can be reasonably sure, it seems to me, of a better market here at home for milk and other dairy products, for eggs and poultry, for fruit and vegetables, for some time to come.

How long these better prices will last is something else again, for they are based on bad economics and wrong principles, being largely the result of

huge government spending which will in time bog us all down by ruinous taxation. These better prices are like the temporary stimulation that you get from a shot in the arm, but for which you have to pay in headaches later.

Get Your Bomb Shelter Ready

So, when the blow-up comes, all of us had better have a good cellar to crawl into to wait until the hurricane is over. Better have plenty of potatoes down in that old bomb-proof cellar, also, for the depression which will follow this war sooner or later may make the last ten years look like a picnic.

Goodbye, Subsidies for Agriculture

One effect of the war which farmers will need to think about is that government will not be able to continue its huge expenditures for relief, social security, and subsidizing agriculture as well as for national defense. It is just absolutely impossible even in this rich country to find taxes to carry on the spending that government has been doing, plus the additional enormous spending for defense. Therefore, you should look forward to the cutting down of appropriations for soil conservation, crop control, and parity payments. That has nothing to do with politics, for no matter what party is elected this fall it will be forced to cut some of these programs, simply because there is not money to do everything. Naturally, government officials won't say anything about this until after election. Make your plans accordingly.

How to Prepare

Now, while we are talking about defense programs, preparedness, and prices, let me suggest one thing for both national and individual economic defense. Let's "take steps", as the old Yankees used to say, to make the United States and every farm in it more nearly sufficient unto itself. As a nation let us be less dependent upon exports and imports. Then we need have little fear of what Germany, Japan, or any other nation can do to us by shutting off our trade. And as individual farmers, let us get more of

(Continued on Page 10)

Keep Your MILK PRODUCTION UP!

Supplement
SUMMER PASTURE
with
BEACON
Dairy Feeds

Summer pastures ordinarily yield only one-fifth as much as spring pastures. Protein is lower, fibre is higher and the growth is less digestible.

Don't let poor pasture rob you of summer milk profits or prevent your cows from reaching high production next fall and winter. Do as hundreds of Northeastern Dairymen are doing. Supplement summer pasture with Beacon Dairy Feeds. These time-tested rations help you hold production up and help keep your cows in condition for maximum production during their entire lactation.

Beacon feeds have blazed a new trail in feed service. In the very beginning we laid down the strict rule that every ingredient used in our feeds must be of first quality—that the single purpose of every ingredient was to contribute a definite feeding value to the ration. And that all ingredients must be carefully blended according to the latest scientific research and soundest feeding practice.

This policy has been strictly followed during the past 22 years. Northeastern Dairymen have learned that they can buy Beacon Dairy Feeds with a full confidence in their high quality and assurance of proven results.

Our feeds are sold by Beacon Dealers in the Northeastern States.

Circlevue Dora May, a six-year-old Guernsey owned by Floyd Somes of Jack's Reefs, Onondaga County, N. Y. She has made four records averaging around 9,000 lbs. of milk and 478 lbs. of butterfat. Mr. Somes' herd was recently classified by the county breed association committee, this cow being classified as "very good."

Pasturing Meadows

And Other Questions of Interest to Dairymen

How much harm does it do to a meadow to turn the cows in in the fall and let them graze?

It is entirely a matter of management. There is no question but that a meadow can be seriously injured if you allow the cows to chew it right down to the roots late in the fall. It should go into the winter with some growth to furnish a protective covering. On the other hand, it is possible to have such heavy growth that it will do more harm to the meadow than it does good. There is no cheaper way of harvesting grass than to let the cows do it themselves; and if there is a good growth of after-feed, by all means pasture it to a reasonable degree.

One of the difficulties of pasturing meadows has been at least partially solved by electric fences. They can be easily moved. In fact, if you have an extra heavy growth, you will get better returns from it by fencing off a part of it, allowing the cows to graze for a week, and then moving them to another spot which will allow the grass to recover. The thing to watch is not to pasture too late or too heavily.

Keep Bull at Home

I have a purebred herd. On several occasions my neighbor's scrub bull has broken through the fence and bred some of my heifers, causing a serious loss. It is my impression that it is against the law to allow scrub bulls to run at large.

You are partially right. There is no New York State law that forbids a man to allow scrub bulls to run in pasture on his own farm. Section 95, article 5 of the New York State Agriculture and Markets Law says:

"PROTECTING THE BREEDING OF PUREBRED STOCK. It shall be unlawful for any person or persons owning or in the possession of any bull of the age of more than nine months, any stallion of the age of more than eighteen months, or buck or boar over five months of age, to suffer or permit such animal or animals to go, or range, or run at large on any lands or premises without the consent of the person entitled to the possession of such land or premises."

However, you cannot claim damages if this bull gets through your part of the line fence where you have neglected to maintain it.

As we see it, there are about three possibilities when you have such trouble. One is to suffer in silence and keep on good terms with your neighbor. The second is to haul him into court, which certainly will not promote a feeling of neighborliness. The third is to discuss the situation with him

calmly and try to get him to keep the bull confined.

There is a distinct tendency toward keeping a herd sire in a bull stall with an attached pen constructed so heavily that there is no danger of his getting out. When such practice becomes more nearly universal, difficulties such as you have experienced will be lessened.

* * *

Cream Line on Milk

I sell milk at retail in a small village. Recently I had a flood of complaints that there was no cream line on the milk. All of the complaints referred to one day's delivery, but I am uncertain as to the cause of it.

I am quite sure that this situation was caused by pasteurizing at too high a temperature. Letting the milk get even two or three degrees higher than the recommended temperature will cause a considerable shrinking of your cream line, and if it gets very high, the cream line will practically disappear. The high temperature seems to break up the fat globules so they do not rise to the top.

* * *

Satisfied With Calf Vaccination

Due to lack of pasture land, it has been necessary for me to pasture my young stock in a community pasture where an average of about one-third of the mature heifers, including mine, have aborted, mostly in the pasture.

I started vaccinating in January, 1939. Up to the present time I have vaccinated eleven heifers, four of these having calved at the proper time even though they were in this same community pasture with these other heifers that are still aborting at about the same average. The other seven are not of age to calf yet.—Otto Kegebein, Munnsville, N. Y.

"Reminds me of th' Boss, last time I asked him fer a raise in pay."

SEE THE DIFFERENCE *Purina* MAKES!

Feed for . . .

**Maximum Egg
Production**

**Steady, Year-'round
Laying**

High Hatchability

Quality Table Eggs

Purina Poultry Chows are built for more than just high egg production . . . they are built to fit all the needs of the Northeastern poultry raiser and breeder!

Purina Poultry Program is Made-to-Order for Northeastern Poultrymen!

NORTHEASTERN poultry raisers are recognized as having breeding stock of the finest quality. Success in poultry raising, however, depends on more than just good breeding. With this must go good feeding, sound management, careful sanitation, and proper care of eggs. These are the things which go to make up the Purina Poultry Program. Northeastern poultrymen are quick to recognize the importance of *all* these points. That's the big reason why the Purina Program and Purina Chows have had splendid acceptance in the Northeast for many years.

Purina Poultry Chows are made *especially* for the type of poultry raiser found in the Northeast. They go hand in hand with good breeding to

bring the poultry raiser maximum results in egg production, egg quality, and hatchability. There's a *real difference* between Purina results and results from a feed that does not have the research, knowledge and the quality of ingredients behind it that Purina feeds have.

Like many other Northeastern poultry raisers, you, too, should benefit from the difference Purina makes. Put the Purina program to work in your own flock and see for yourself the results that it brings.

See your Purina dealer today for more information about Purina Layena, the complete laying feed, or Purina Lay Chow, the mash feed that goes with scratch grain.

**WE MUST FIGHT
BY PRODUCING**

BEFORE the end of this year, I predict that scenes like the one pictured below will be enacted in countless homes. According to every prediction, grim-faced Americans will read and listen to descriptions of starvation and want in nearly every European country.

Already we are reading dispatches about their untilled fields and slaughter of breeding stock. While attending a meeting of the Directors of the New York Life Insurance Company, ex-President Herbert Hoover told me that the skeleton of hunger would stalk through Europe this coming winter. In his work at the head of the Finnish Relief, Mr. Hoover has surveyed the food outlook of Europe and he is sure America must become the bread basket of the world.

What does this certain prospect of European famine mean to us in America—to those of us who, as farmers, or feed distributors, are engaged in the basic industry of producing food? Can we be content merely to shudder at the thought of starving women and children—and then turn to our routine job of producing in accordance with the customary demands of the past?

I say we must do our part—Fight by Producing! Our part in the fight to preserve some vestige of civilization is to step up production so innocent people may live. No one may shirk the moral responsibility of striving to save human life, if it lies within his power to do so.

For the sake of human lives, let us breed an extra sow, or raise an extra flock of fall chicks, or fit our cows for extra milk this fall and winter. Let us manage and feed our stock to get every possible dozen, pound, or quart from the crops we have just harvested. If it makes us extra money, it will be money fairly earned. If we do no more than break even, we will have the priceless satisfaction of having done our bit to aid suffering humanity.

Every single one of us must Fight by Producing. Will you do your part? I want to urge *you* not only to increase your own production, but to use your influence among your friends—help them to help America feed the world. I'm dreaming, thinking, talking, and working for our program "FIGHT BY PRODUCING"—and I believe you are, too.

What's New in Fruit

*Growers Appraise and Approve Research Work at
New York's Experiment Station at Geneva*

By H. L. COSLINE.

THERE is an old saying that one picture is worth a thousand words. After sampling the new cherry juice developed by the Experiment Station at Geneva, I decided that one taste was worth a thousand descriptions. Judging from the crowd around the cooler that held the juice, others held the same opinion. The "others" referred to were the members of the New York State Horticultural Society and their friends who met August 3rd at the Geneva Station for their annual summer meeting. The occasion gave a wonderful opportunity to look over the experiments which the Station is conducting on fruit.

Fruit growers these days are thinking in terms of marketing and to a considerable extent they are looking for new products to catch the popular fancy and utilize the crop. The Geneva Experiment Station holds an important place in developing new fruit juices.

Fruit to Drink

Both the consumer and the fruit grower are interested in apple juice. Some juice on the market is good and some is disappointing. The men at Geneva believe they have discovered the reason for the difference. There is the question of the best varieties for juice. Work is also being done on raspberry juice, rhubarb, and a combination of raspberry and apple juice. One of the problems, says Director Parrott, is how fruit growers can control the production of fruit juice to get a reasonable price for the crop.

For years the Geneva Station has done outstanding work in the breeding of new fruit varieties. When something better is developed, as for example, the Fredonia grape, the Newburg or Taylor raspberry or the Bristol black raspberry, the breeder is by no means satisfied; he looks for something still better. Perhaps the perfect fruit of any variety will never be discovered. At least there will always be differences of opinion but the work will continue. Right now there is a definite need for a better late winter apple.

Better Roots

Some years ago a considerable number of dwarf apple trees were set out. They were not too successful and interest waned. More recently orchardists have expressed a desire for a semi-standard apple tree that would be somewhat smaller than the standard tree but larger than the old dwarfs. So a search was made for root stocks and the search has brought results. The advantages claimed for the semi-standard tree are that more trees can be planted per acre and the fruit sprayed or dusted and harvested with greater ease and at less cost. It has also been found that root stocks differ in hardiness and productivity and that careful, painstaking selection can isolate root stocks that show a definite resistance to certain diseases.

Fresh Fruit the Year Round

In one room at the station guests saw three quick-freezing lockers designed for family use. Tests are being run on the comparative effectiveness of these machines. Some quick-freezing problems have been answered but there are plenty more. For example some varieties are much better than others for freezing. Then there is the question of the best temperature for freezing and holding different products. As yet no one knows the best kind of package. Paper containers have their good points but some of the early ones

Herbert King, President of the New York State Farm Bureau Federation and Master Farmer, samples the new cherry juice developed at the Geneva Station.

were not absolutely sterile. One thing is sure, quick freezing of fruits, vegetables and meat is here to stay.

Bug Eat Bug

Not so many years ago the pests of fruit, both insect and disease could be counted on your fingers but each year, it seems, brings new ones. Perhaps one of the biggest problems which the Station has attempted to solve is the development of more effective sprays which will not leave objectionable spray residue on the fruit. But sprays are not the only means of controlling pests and diseases. A few years ago the Oriental Peach Moth was a distinct menace to fruit growers. The development and release of parasites by the Station have resulted in a considerable degree of control. The Japanese Beetle, long a pest in New Jersey is steadily spreading. Experience has shown that it is more troublesome in new areas invaded than in places where it has been established for years. Probably the answer is infestation of the insect by diseases and parasites. This is being studied in order to make conditions favorable for the organisms which kill off the beetles.

Vegetable growers have rapidly adopted the use of starter solutions of fertilizers when plants are transplanted. Now strawberry growers are also finding that this practice helps the crop.

The ramifications of research are endless. It has been discovered at the Station that small additions of calcium chloride to tomatoes and peaches helps to retain their firmness when canned. The adoption of this practice will indirectly aid fruit and vegetable growers. In fact, effective September 17th, the Pure Food Laws have been amended to admit the addition of calcium chloride, a substance closely resembling salt, to canned products.

Fruit growers, in fact all farmers have a different attitude towards research than prevailed 20 years ago. Not only are they looking to experiment stations and colleges for information but they are taking the lead in indicating to those institutions the problems on which they need answers. Today the country is economy-minded but research activities should not be crippled. If anything let us increase funds for research.

PHILADELPHIA area host to VEGETABLE GROWERS

By PAUL WORK

PHILADELPHIA is a great center for the production and consumption of vegetables. For many decades, South Jersey has been a great vegetable region with Swedesboro, Glassboro, Bridgeton and Gloucester as important towns. This is sandy land country and it was here that overhead irrigation was first developed.

Just east of Philadelphia is an important combination vegetable and orchard area with soils still light but averaging a little heavier. Here for a long time, quite a struggle has been going on between the orchardists, who raise vegetables so that they can have some money to keep on raising apples and peaches, and the vegetable growers, who hope to have some fruit to sell after they

Paul Work

have gone broke raising vegetables. As in other areas, the good growers of both groups have done pretty well year in and year out in spite of some pretty hard sledding a few years ago.

Coming further north, the more silty river bottom of the Delaware has developed three or four huge enterprises;—King Farms whose superintendent, A. C. Thompson is President of the Vegetable Growers' Association of America; Starkey Farms that pioneered in the area; and the Becker farm.

The old market gardening area about Philadelphia has given way to building developments, but many of these gardeners have moved out to a greater distance from Philadelphia and vegetable growing on the heavier and more hilly land of southeastern Pennsylvania has been coming forward very rapidly. This is on a more specialized basis than the old market gardening. There are important canning tomato areas in these counties and the canning industry throughout all of Southeastern Pennsylvania has made amazing growth in the last ten years.

New Yorkers might figure that this is quite an area to compete with. This is true but with a good many crops, New Yorkers have their innings after the weather has gotten rather hot and dry, and after the earlier crops are out of the way. Hudson Valley tomato growers have learned this and are putting up good packs of tomatoes to follow the Jersey crop.

Two Days of Touring

The convention of the Vegetable Growers' Association of America covers four days (Aug. 26-29) and two full days are devoted to touring. There has seldom been a time that New York growers could see so widely varied an

array of vegetable enterprises as they can on those two days. The markets of the city, the auction market at Glassboro, Seabrook Farms where vegetables are frozen on a large scale, the Campbell Soup plant in Camden, the Comly market gardens near Philadelphia, and the King and Becker farms near Morrisville, Pennsylvania, (across from Trenton) are all to be visited.

At King Farms, there is to be an extensive demonstration of vegetable machinery and supplies. This affords an opportunity to see a good many

makes of different kinds of equipment in a way that can seldom be done at home, and to meet and talk with people who have actually used them.

The two days of convention at the Bellevue-Stratford include talks by H. C. Thompson and M. P. Rasmussen of Cornell, Mrs. Pauline Beery Mack of Penn State on the use of vegetables, Secretary Horace Herr of the National League of Wholesale Fresh Fruit and Vegetable Dealers, and a number of others. Dr. J. J. Williman of the new Regional Research Laboratory at Philadelphia is to tell of the work that this great laboratory is undertaking, to develop new uses for vegetables. Dr. J. B. Hester of Campbell Soup and Dr. V. A. Tiedjens of New Jersey will deal with soil and fertility problems.

A. J. Pratt, Junior Extension Specialist in Vegetable Crops at Cornell, has 16 teams lined up to take part in

the contests of the National Junior Vegetable Growers Association at Philadelphia. A special committee has made plans for the entertainment of the ladies during the meetings. An evening trip to Atlantic City will leave Philadelphia late Monday afternoon.

* * *

Early Tomato

People do not think of New Hampshire as a place to get first early tomatoes but Miss Eunice Hawkins of Lisbon in Grafton County in the central part of the state made her first picking on July 8th according to the Press Service of the University of New Hampshire. Miss Hawkins has been saving seeds from plants with the earliest fruits for several years and she grows her own plants to set outdoors. There is a record for New Yorkers and New Englanders to shoot at!

The Wick of Freedom's Lamp

UNITY OF SPIRIT in a nation comes only from the devotion of its people to a fundamental ideal. Fortunately, *America's* fundamental ideal has always been *freedom for the individual*—the fullest measure of freedom consistent with proper respect for the rights and liberties of others.

Who stands for this freedom? All Americans do, all ages and all groups. But for 150 years of American history the very wick of the lamp of freedom has been the American farm.

America's farms have given to the nation far more than an abundance of food. Released from the soil by the use of machines, generation after generation of farm sons and daughters, imbued with the American ideal, have peopled our cities and created our industrial civilization.

This nation was established and built by farmers. Its basic social unit has always been the family on the family-size farm. So long as its foundation is the man who farms his acres, speaks his mind, helps his neighbor and prizes his freedom above his ease, America is secure at its base against disunion.

Because these things are true, the soundness and vitality of the family farm are

essential to America. Sometimes we are told that it is endangered, that it is unable to compete against larger farms and large-scale methods.

Fortunately, that is not true. Today the number of American farms is at an all-time high and *the overwhelming majority of them are one-family farms*, operated by the members of the family.

Within recent years the farm equipment industry has produced mechanized equipment especially for the smaller farm—low-cost small tractors and a full line of implements for use with them. Now the little tractors are humming on thousands of American farms. Each passing day sees more of them in use. The small tractor is making itself as essential to American farming as the light truck is to American business transportation.

The progress of mechanization has strengthened the position of the American family farm and all that it stands for. Enlightened agriculture remains the strong and enduring social foundation of America.

We are proud that this is true, proud that the industry of which this Company is a part has helped to make it true.

Will War and Famine Raise Your Prices?

(Continued from Page 5)

our living from our own farms.

I have pointed out that with the exception of two or three crops, exports of farm products are very small. Therefore, with some adjustments, they can be taken care of here at home through increased buying power of our people, by better merchandizing and advertising, and by finding new uses for farm products. Of all these ways to make our country grow self-reliant, this last way, the finding of new uses for farm products, is the most important and has the most possibilities. I am opposed to huge government spending except for necessary defense, but there is one place where I would spend ten times more money than is being spent now, and that is to put more and more scientists at work in research to find more and better uses for products of our farms. We have the resources and we have the brains to make America get along, if necessary, on its own. And if we did, we wouldn't be so badly off either!

Farmers Would Starve Too

As with the country, so with the individual farmer. The same principle, that is, depending on our own resources, applies to a lesser extent to nearly every farm. If we had a famine in this country, there are so many farmers who have been specializing in one or two products that they would starve to death just as fast as city folks. We are not going to have a famine here, but we can have, and very likely will have, some very serious times ahead. One way to prepare for them is to learn how to get most of your living from your own place, and the grand thing about this policy is that it pays either in good or bad times. By so doing you can get more fun out of life than you can by working yourself to death to produce so much stuff at wholesale prices, and then buying back your supplies at retail prices.

I am not suggesting that you go to extremes in readjusting your farm business, but I know that it would take very little planning, and very little expense, to raise and to can practically all of your vegetables, much of your small fruit, and much of your meat. These, together with your dairy and poultry supplies, would make you reasonably independent. The rapid coming of storage lockers and quick freezing boxes is also going to help make this dream of mine practical and possible.

Watch That Debt!

As a matter of economic preparedness, I cannot over-emphasize the warning to beware of debt. Use the next year, or whatever the period of better prices may be, to pay off debts, and be extremely careful not to get

out on a limb with further debt which may spell ruin for you when bad times come. This does not mean that you should not buy a new farm, or add to the old one, when you have a substantial amount to pay down for the farm. In fact, it is a good time to buy right now the right kind of farm. It does not mean, either, that you should stop buying new and necessary farm equipment. In fact, farm labor is likely to be scarcer than hens' teeth in the next few years. Conscription and increased activity in city shops, together with pressure of labor unions, will make farm labor hard to get. So about the only way to meet the labor situation is with farm machinery. But be sure you can pay for it. Reduce the old mortgage, pay up delinquent interest; in short, get economically prepared while you can.

Farmers Will Use Their Heads

Always in times of crisis people get hysterical. They lose their heads. Some Senator said the other day that the whole United States Congress had stopped thinking. Farmers cannot afford to do that, and they won't either if outsiders leave them alone. Most of you will remember, as I do, the hysteria in the first World War about "food will win the war." American food did help then. But the food situation, so far as Europe is concerned, is different now. And all of you old-timers remember how backyards and city parks were plowed up in the other World War. Farmers themselves put everything they had into raising more food, with the result that they were not able to turn it off when the war was over. The surpluses that resulted threw American agriculture out of gear, and we have been paying through the nose for it ever since. The crop control and regimentation schemes of the United States Department of Agriculture have been aimed at slowing down farm production, which was too rapidly speeded up in the first World War.

Let us not be rushed off our feet again. It may be necessary and wise slightly to increase production of some farm commodities, but the best way for a farmer to serve his own family and his country is to do his own thinking, and to continue to do business on approximately the same scale as he has in recent years, paying due attention to keeping his costs down and his efficiency up.

Finally, in this time of trouble, when the world stands at the crossroads, farmers should get some comfort out of the fact that always in times of world or national distress, the farm itself and the farm home are the best and safest places in all the world in which to live.

MORE CUTTER FOR YOUR MONEY

More farmers buy Papec Cutters than any other make because they get a bigger, sturdier, easier running machine that is *guaranteed* to do more. And the Papec costs \$25 to \$75 less than other cutters of similar weight and throat width.

Does More Jobs

A Papec earns its keep the year round,—makes corn, grass and sorghum silage; chops hay; stores straw after combining or direct from the thresher; shreds fodder; elevates grain. You handle ALL your feed and bedding, with a big saving in time, labor and space.

Costs Less To Run

Papec's 3-bearing main shaft and extra heavy cutting wheel make it the easiest running cutter on the market. Saves as much as 25% on gas. Improved self-feeder handles roughage faster and saves labor.

Six Papec Models

With six Papec models to choose from, ranging from 3 to 30 H.P., there is no need to buy more or less capacity than you can use. Papec knives and other parts cost less and are quickly obtainable for any Papec no matter how old or where located. See your dealer or send name NOW on margin of this ad for full information on the cutter that DOES MORE but COSTS LESS.

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

SIGNIFICANT EVIDENCE of the standing of the National Grange as the spokesman of agriculture was furnished at both the recent Republican and Democratic national conventions, when the members of the executive committee of the Order were given a lengthy hearing before the respective platform committees to express the wishes of the agricultural people of the United States. Furthermore, Grange views were to a considerable extent incorporated in both party platforms as the latter were finally adopted.

National Master Louis J. Taber of Ohio, with Messrs. Fred J. Freestone of New York and Eugene A. Eckert of Illinois, attended the Philadelphia convention and were joined at Chicago by National Secretary Harry A. Caton of Ohio. The committee members expressed much satisfaction at the courtesy accorded them at both conventions, and in addition to their work before the platform committees the Grange leaders were favored with tickets for excellent convention seats, in each case remaining as interested spectators throughout the proceedings.

PREPARATIONS ARE COMPLETE for the annual big Grange Day at the New York State Fair in Syracuse, which occurs Wednesday, August 28. The exercises include a formal speaking program in Empire Court at 11 A. M., at which State Master W. J. Rich and other State Grange officers will appear and the National Grange will be represented by the High Priest of Demeter, Charles M. Gardner of Springfield, Mass. As usual the Service and Hospitality Committee of the State Grange will keep "open house" during the fair, in the Grange building for accommodation of Patrons.

THE NEW ENGLAND GRANGE BUILDING on the Eastern States Exposition grounds at West Springfield, Mass., will be open during the entire Exposition week, September 15-21, and its very complete rest privileges will be available to all Patrons. The Grange building is also being kept open daily, including Sundays, all summer as a tourist information center and welcome spot for Patrons and friends.

IN MAINE consideration is being given to a possible change of dates for the annual State Grange session each year, from December to October. December weather in Maine is apt to be of the wintry variety and it is believed the shift to warmer October will prove as satisfactory in the Pine Tree State as it has in the sister state of Vermont. At the present time more than a dozen State Grange sessions are in progress every October.

ON SATURDAY, SEPTEMBER 28, at Delmar, New York, a big Grange ritualistic meeting will be held in the Bethlehem Central High School, with exemplification of degree work and other interesting features. Several counties will join forces and there will be afternoon and evening sessions.

CONNECTICUT MEMBERS are looking forward to an event of unusual interest on the evening of October 17 at West Hartford. At that time former State Master Allen B. Cook will be presented with his Golden Sheaf cer-

tificate, indicating the completion of 50 consecutive years as an active Grange member. Mr. Cook is held in high esteem by Connecticut Patrons and a great host of them will be on hand to participate in the October occasion.

THE GRANGE IN PENNSYLVANIA is joining with educational and religious groups, 4-H Clubs and Future Farmer workers in sponsoring a Country Life Conference at Newton Hamilton in Mifflin County, August 19-21. A varied program will be put on, including many open discussions of rural problems, and with certain periods set aside for recreation and entertainment.

THE DEATH of the two oldest Grange members in New England occurred recently within a few days of each oth-

er—Hiram Clark of Shirley, Mass., who had just passed the century mark, and Charles H. George of South Paris, Maine, who would have been 106 years old in September. Mr. George was not only the oldest Grange member in the world, but was believed to be the oldest Mason in the United States also. Both men were veterans of the Civil War, both natives of the state of Maine, and each in good health and continuing Grange interest almost to the last.

STATE MASTER W. J. RICH of New York has arranged a series of 23 special meetings throughout the state, at which the officers of the New York State Grange will confer the sixth degree for the benefit of those who desire to take the Seventh Degree at Syracuse in November. As arranged the

schedule brings one of these meetings within reasonable driving distance of every Patron in New York State.

GRANGE MEMBERS IN MAINE are pained to learn of the serious illness of former State Master John E. Abbott of North Berwick, who has been in failing health for a year and whose condition has recently taken a decided turn for the worse. More than a decade ago Mr. Abbott served the Maine State Grange as its executive head for six years, and his aggressive leadership was responsible for much Grange progress in the Pine Tree State.

THE SERVICE and Hospitality Committee of Pepacton Grange No. 1407 in Delaware County, New York, has

(Continued on Page 19)

The Word For Economy Is CHEVROLET

Economy means low cost of operation. Truck users everywhere say that low cost of operation means *Chevrolet*.

That is why Chevrolet trucks lead all others in sales year after year; truck buyers choose Chevrolets because of their proved economy and efficiency.

Chevrolet economy means a lot more than just "miles per gallon of gasoline" and "miles per quart of oil." It means also low first-cost . . . it means high efficiency and low maintenance cost . . . it means durability and long life.

Chevrolet's traditional qualities—

those qualities that have put Chevrolet in the lead and kept it there—all add up to low cost of operation. . . . That is why truck users everywhere say that Chevrolet trucks give the most value for every dollar of money expended.

CHEVROLET MOTOR DIVISION, General Motors Sales Corporation, DETROIT, MICHIGAN

GET YOUR COPY OF CERTIFIED FACTS ABOUT CHEVROLET'S PROVED ECONOMY

Ask your Chevrolet dealer, or write to us, for your copy of "Says Who?"—a 16-page book that gives the facts about truck operating costs, facts certified by the Contest Board of the A.A.A. We printed this book for you—so that you might have authoritative evidence as proof of what Chevrolet trucks can do and what they cost to operate and maintain.

CHEVROLET TRUCKS

THE LEAGUE STANDS FOR THE AMERICAN WAY

League Member Trask

donated this church to his Community

At about the time that the father of Paul Revere came to America, the forefathers of A. O. Trask, League member of Southern Delaware County emigrated from Somerset, England.

"One branch of our family, the Bartletts, came here as early as 1623," Mr. Trask says. "New York State was in the hands of the Indians then, so they settled in Connecticut. Later they moved over to Delaware County where we live today.

"Our people came to the New World to escape political and social oppression and to find religious freedom," explains Mr. Trask. "And it seemed to me that we folks living here in the hills today ought to have an opportunity to attend divine service. That's why I bought and repaired the church in Readburn, and why I gave it to the community. Two other trustees and myself look after its maintenance. A visiting pastor comes every Friday evening for services and Sunday School. We use the building for community gatherings, too; and Dairymen's League meetings have been held there," says Mr. Trask.

NO MAN in America's rich Revolutionary history has a stronger hold on the imagination and affections of Americans everywhere than Paul Revere. His hurrying hoofbeats and his cry of alarm still ring loudest in American ears, but he performed many other acts of great value to the American cause.

He it was who arranged to hang the signal lights in the North Church steeple. He made the cannon and copper spikes that went into the frigate Constitution. He was a leader in the secret "Sons of Liberty," who swept down on Griffin's Wharf to dump the taxed tea into Boston Harbor. And of his many lonely rides carrying news of the gathering storm of Revolution, one brought back quick assurance that New York and Philadelphia "would stand by Boston in its hour of distress."
